The Netherlands Antilles are six small and scattered islands in two groups of three; almost 600 mi. separate the two groups. Three islands lie between the Virgin Islands and Antigua, and three to the southwest across the Caribbean, near the Venezuelan coast. Their total area is 366 sq.mi., and their total population (1955 est.) is 181,000. The largest island is Curaçao (173 sq.mi.), with a population of (1953 est.) 114,683. Its largest city, Willemstad (pop. 44,062) is the capital of the Netherlands Antilles. Aruba (69 sq.mi.) has a population of 54,625, Bonaire (95 sq.mi.), one of 5,153, while the small islands in the Windwards have few inhabitants, St. Eustatius (7 sq.mi.) 1,015, St. Martin (only the southern 17 sq.mi., as the rest belongs to France) 1,571 and Saba (5 sq.mi.) 1,458. The governor in 1955 was A. A. M. Struijcken, and the premier was Ephraim Jonckheer.

History.—As a result of the election of Nov. 15, 1954, the opposition party came into power. Its program had to be adjusted to the limited income which the economic structure of these small islands permits. The petroleum industry continued to be the principal employer of the islands, with no appreciable decline during 1955 in the output of the two great refineries, that of the Royal Dutch Shell on Curaçao and that of the Creole on Aruba. Slight labour controversies in the industry were settled satisfactorily.

The year's chief occurrence was the royal visit, Oct. 18–27, when Queen Juliana visited the Netherlands Antilles, the first monarch to do so. Under the new constitution (1954), the crown is the essential link between the three states, the Netherlands, the Netherlands Antilles and Surinam, which now constitute the Dutch State. The Netherlands Antilles maintains at The Hague an official who is at one and the same time ambassador from the Netherlands Antilles, in all dealings with governmental agencies, and a member of the Dutch cabinet whenever matters relating to defense, foreign policy or anything else affecting the islands are under discussion. He has a colleague from Surinam with similar attributes and duties.

Systematic efforts to increase and diversify the industry and agriculture in the islands were continued during 1955. Trade between the islands was improved through more frequent and direct shipping and air schedules, in order to bring the markets in the larger islands more readily within reach of the three in the east. (C. E. Mc.)

Education.—On Jan. 1, 1954, there were 52 elementary schools with 16,680 pupils, 42 higher elementary schools with 15,572 pupils, 3 secondary schools with 539 students and 3 technical schools with 595 students.

Finance.—The monetary unit is the Netherlands Antilles guilder or florin, valued at 53.0264 cents U.S. currency during 1955. The central budget for the fiscal year ending March 31, 1956, estimated revenue at 36,000,000 guilders and expenditure at 35,826,000 guilders. The public debt at the end of 1955 was 6,071,000 guilders; notes in circulation (Dec. 31, 1954) 38,740,875 guilders.

Trade and Communications.—Exports in 1954 totalled 1,455,343,000 guildens; imports were 1,542,678,000 guildens. Almost all the exports consisted of petroleum products and about 85% of the imports consisted of crude petroleum, principally from Venezuela. The U.S. supplied about two-thirds of the nonpetroleum imports.

The highway mileages of the islands of the Netherlands Antilles in 1952 were as follows: Curaçao 220; Aruba 165; Bonaire 32.5; St. Martin 17; Saba 4.5; and St. Eustatius 2.5. On Jan. 1, 1955, 9,337 motor vehicles were in use on Curaçao and (Dec. 31, 1953) 4,907 on Aruba. Telephones on Curaçao and Aruba totalled 4,678 on Dec. 31, 1953. In 1953, 14,407 vessels entered the ports of Curaçao and Aruba.

Manufactures.—Exports of refined petroleum products produced by the three refineries—two on Curaçao and one on Aruba—totalled 41,458,600 metric tons in 1953, including 26,700,854 tons of fuel oil, 3,711,544 tons of diesel oil and 2,241,369 tons of kerosene. (J. W. Miv.)

Netherlands New Guinea.

The western part of the island of New Guinea in the western Pacific, with adjacent smaller islands, forms part of the territory of the kingdom of the Netherlands. Area: about 160,618 sq.mi. Pop. (1954 est.): 700,000 (of whom about 400,000 are in districts under regular Dutch administration), mainly Papuans but including about 8,000 Europeans, about 6,000 Indonesians and about 1,700 other Asians (mainly Chinese). Principal towns: Hollandia (cap.), pop. (1954 est.) 11,322; Sorong 10,000; Biak 3,670 and Merauke 3,350. Governor in 1955 J. Baal.

History.—In 1955, the second year of the three-year development plan, with insufficient labour and the housing problem still being the main stumbling blocks, economic development remained principally confined to agrarian research and related activities. The fight against malaria and framboesia (yaws) was continued on a large scale. In April the budget for 1955, balanced at Fl. 111,263,425, was submitted to the Dutch parliament for approval.

Under the three-year development plan the draining of an area of about 48 sq.mi. near Merauke, with an expected rice production of 6,000 tons (the annual need amounted to 6,800 tons), was started. The aerial survey of the whole territory and the construction of a series of airfields along the north coast were to be completed in 1956.

In a number of towns and regions government advisory councils, including Papuan members, were set up.

While co-operation with Australia in various fields was extended, relations with the Indonesian government deteriorated on account of "invasions" of small Indonesian military groups in May 1953 and Oct. 1954. In Oct. 1955 Indonesia's new request to put the dispute concerning the status of Netherlands New Guinea on the agenda of the UN general assembly got the required two-thirds majority vote. (G. W. O.)

Education.—Schools (1954): primary 557, pupils 28,949, teachers 879; post-primary (including 1 Roman Catholic secondary) 4, pupils 280, teachers 14; vocational 4, pupils 204, teachers 10 (excluding specialized training courses); primary teachers' training courses, students 220.

Production.—Oil (annual output) 554,265 metric tons; (export value 1955) 26,444,000 guildens.

Netherlands Overseas Territories: see NETHERLANDS ANTILLES; NETHERLANDS NEW GUINEA; SURINAM.

Nevada.

A state of the mountain group of western states. Nevada was the 36th state to be admitted to the union, on Oct. 31, 1864; it is popularly called the "Sagebrush state" or the "Silver state." Land area 109,789 sq.mi.; water area 751 sq.mi. Pop. (July 1, 1955, est.) 216,000. Population statistics according to the 1950 census were rural 68,458; urban 91,625; white 149,907; nonwhite 10,176; total 160,083. The principal cities (with 1950 pop.) are: Carson City, the capital, 3,082; Reno, 32,497; Las Vegas, 24,624; Sparks, 8,203; Elko 5,393; Ely, 3,558.

History.—The 1954 general election resulted in the Republican party's winning the office of lieutenant governor in the state government and retaining the offices that were won in 1950. While Democratic registrations outnumbered Republican reg-

tions in the state approximately two to one, the Republican candidates retained their offices by substantial majorities. Three new members of the board of regents of the University of Nevada were elected, and the people approved four amendments to the constitution of the state of Nevada.

The Nevada legislature considered many important issues in 1955. It enacted a 2% sales tax law, an aid-to-dependent children program, a law providing for the reciprocal enforcement of support of dependents, increased gambling control laws, extensive revision of laws pertaining to school organization and administration, an interstate highway user fee apportionment law, and the California-Nevada interstate compact on water.

Late summer brought drought conditions in a number of areas of the state, and federal aid was necessary in order that feed might be provided for starving livestock in the stricken areas.

On July 1, 1955, elected officers were: governor, Charles H. Russell; lieutenant governor, Rex Bell; secretary of state, John Montz; state controller, Peter Merialdo; state treasurer, John W. Franks; surveyor general, Louis D. Ferrari; inspector of mines, Mervin J. Gallagher; superintendent of state printing, J. A. McCarthy; clerk of the supreme court, Ned A. Turner; superintendent of public instruction, Glenn A. Duncan; attorney general, Harvey Dickerson.

Education.—In June 1955 Nevada had 194 elementary schools with average daily attendance of 29,065; teachers numbered 1,255. High schools totalled 36, with an average daily attendance of 8,303 and a staff of 434 teachers. Kindergarten average daily attendance was 2,621; 17 kindergartens with 56 teachers. Average daily attendance for all schools was 39,989. State-wide expenditures for elementary and secondary education, all schools, were \$22,224,000 (est.) for the year, of which \$65,765 was provided as state aid.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the fiscal year ended June 30, 1955, \$919,093 was expended by the state health and welfare departments. In addition, \$1,816,688 was expended for old-age assistance benefits to 2,712 persons, who received an average monthly amount of \$57.16. On June 30, 1955, the state prison had 334 men and 14 women inmates; total expenditures for the fiscal year were \$327,437. The Nevada school of industry had 38 boys and 6 girls under school control; total expenditures for the fiscal year were \$65,789. The state hospital for mentally ill persons had 439 patients in average daily residence during the fiscal year; expenditures for the fiscal year were \$416,922. The state children's home had 45 boys and 28 girl residents during the fiscal year, and the cost to the state was \$193,069.

Communications.—During the fiscal year ended June 30, 1955, the total expenditure for highways was \$12,597,963. There were approximately 26 mi. of road in the designated state highway system, including secondary roads. Railroad mileage totalled 1,647 in 1954. Motor vehicle registrations on June 30, 1955, totalled 107,817. There were 410 registered aircraft and 68 public airports in 1954.

Banking and Finance.—On July 1, 1955, there were 37 individual banks and institutions in the state, of which 30 were branches, 4 were national banks and 3 were state banks. The resources of Nevada banks totalled \$24,784,000 and deposits were listed as \$283,076,000. The credits of the state for the fiscal year ended June 30, 1955, amounted to \$46,433,239; the debits to \$46,810,179. There was a treasury balance of \$11,250,913. The state had bonds outstanding in the amount of \$1,428,000 for the construction of office and institutional buildings. The par value of bonds and securities held by the state totalled \$2,583,439, and they produced an income of \$338,524. A 2% tax on gambling netted the state \$3,805,003 and a state property tax of 69 cents each \$100 of valuation netted \$3,124,163. The total assessed valuation of the state for 1954 was \$478,253,836.

Agriculture.—The total farm value of the principal crops in 1953 was \$5,858,000; the total acreage harvested was 434,000. In 1953 the cash income from crops sold was \$6,363,000; from livestock sold, \$36,239,000.

Table I.—Principal Crops of Nevada

Crop	Indicated 1955	1954	Average 1944-53
Wheat, bu.	432,000	792,000	741,000
Alfalfa, bu.	476,000	510,000	488,000
Barley, bu.	245,000	324,000	503,000
Hay, tons	458,000	482,000	616,000
Cattle, head	215,000	308,000	341,000
Sheep, head	105,000	120,000	85,000

Source: U.S. Department of Agriculture.

Manufacturing.—Manufacturing in Nevada is limited in scope and production. In 1947 there were 126 industrial establishments in the state, employing approximately 2,667 persons and paying approximately \$8,409,000 in wages for the year. The value added by manufacturing was approximately \$27,777,000. Expenditures for new plants and equipment totalled \$2,959,000 in 1947. During 1955 chemicals and allied products were being manufactured in ever-increasing quantities at the Basic Magnesium project at Henderson, Nev. (J. E. Spr.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Nevada in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Nevada was first among the

Table II.—Mineral Production of Nevada

(In short tons, except as noted)

Mineral	1952		1953	
	Quantity	Value	Quantity	Value
Barite	68,000	\$ 391,000	100,000	\$ 615,000
Copper	58,000	27,848,000	62,000	35,502,000
Gold (oz.)	117,000	4,102,000	102,000	3,563,000
Gypsum	608,000	1,667,000	702,000	1,975,000
Iron ore	1,021,000	3,992,000	497,000	2,648,000
Lead	7,000	2,186,000	4,000	1,145,000
Mercury (flasks, 76 lb.)	4,000	701,000	3,000	628,000
Sand and gravel	2,098,000	2,380,000	2,266,000	2,089,000
Silver (oz.)	941,000	852,000	697,000	631,000

Talc	8,000	180,000	11,000	73,000
Tungsten concentrate (60% WO ₃)	2,000	8,821,000	4,000	13,824,000
Zinc	15,000	5,099,000	6,000	1,337,000
Other minerals	...	4,853,000	...	8,235,000
Total	...	\$64,231,000	...	\$73,665,000

states in the production of tungsten, second in magnesite, manganese and mercury, third in barite and fifth in copper; and stood 28th in the list of states in the value of its mineral output, with 0.51% of the U.S. total.

New Brunswick. Second largest of the four Atlantic provinces of Canada, New Brunswick entered the confederation in 1867. Area: 27,985 sq.mi. Pop.: (1951) 515,697; (June 1, 1954, official est.) 547,000. Capital, Fredericton, pop. (1951) 16,018. Largest city, Saint John (seaport), pop. (1951) 50,779. Other cities, Moncton, 27,334, and Edmundston, 10,753.

History.—Work proceeded on schedule on the \$50,000,000 hydroelectric development of the Saint John river, at Beechwood, with necessary properties expropriated in 1954 and excavations and cofferdam well under way in Oct. 1955. The provincial government under Progressive-Conservative Premier Hugh John Flemming extended its tourist publicity work, and the 1955 tourist influx was the greatest in history. The mining boom continued with new discoveries in Newcastle and other areas. Burnt Hill tungsten mines, first to reach production, started marketing late in 1954. Camp Gagetown, Canada's largest army training area, was occupied by the 1st Canadian division (11,000 men) under canvas in the summer of 1955, and a full-scale, week-long operation was observed by military experts and attachés from 18 other countries. An estimated 3,000 to 4,000 construction workers were engaged in permanent construction work at the camp in Oct. 1955, with a planned increase to 5,000 to 6,000 in spring of 1956.

Education.—Expenditures for education for the year ending March 31, 1955, totalled \$8,348,422. Total enrolment in provincially controlled elementary and secondary schools for the same period was 113,804, with an average daily attendance of 97,682, and 4,327 teachers. Revenues for the year ending March 31, 1955, were \$293,839.

Public Health and Welfare.—In 1954 there were 42 hospitals, containing 5,583 beds. Revenue for the year ending March 31, 1955, was \$4,047,510. Figures available in June 1954 showed that in the preceding year the federal government provided \$1,247,473 per month in family allowances on behalf of 206,815 children; \$1,071,320 in old-age security pensions to 26,690 pensioners; \$2,496,678 in old-age assistance payments to 5,790 recipients; and \$351,634 in pensions to 731 blind. Provincial mothers' allowances totalled \$1,273,836 were paid to 2,096 mothers.

Transportation and Communication.—Figures for 1954 showed 13,187 mi. of roads, of which 3,000 were surfaced; there were 95,000 automobiles. There were four active commercial airports. Telephones in 1954 totalled 91,444. The province's first television station opened in Saint John in March 1954, the second in Moncton in Feb. 1955.

Banking and Finance.—Revenues for the 1954-55 fiscal year totalled \$53,387,213 and expenditures \$53,311,440. The net direct debt less sinking funds was \$108,770,920, the net indirect debt less sinking funds \$10,562,743. In 1954, 161 credit unions lent \$4,128,358 to members.

Agriculture.—In 1952 farmers' total income was \$52,952,000 and in 1953 it dropped to \$46,051,000. Latest revised production figures available were for 1953, when the wheat harvest amounted to 70,000 bu.; oats, 6,840,000 bu.; barley, 338,000 bu.; and hay, 688,000 tons. On June 1, 1954, there were 195,000 head of cattle, 67,000 swine, 66,000 sheep and lambs and 26,000 horses on farms.

Fisheries, Furs and Forestry.—In 1954, 260,900,000 bd.ft. of lumber was cut, valued at \$18,101,400. Latest revised fisheries figures, also for 1954, showed 194,260,600 lb. of fish landed, with a market value of \$6,840,348. For the year ending March 31, 1954, trappers took 78,080 pelts, with a market value of \$200,000 to \$225,000.

Manufacturing.—Latest manufacturing figures available were for 1953, when 25,000 employees in 900 establishments were paid \$60,000,000 to

convert raw materials worth \$162,500,000 into products having a net value of \$295,000,000 and a gross value of \$320,000,000. The value of products of the three leading industries, with number of employees in parentheses, were: pulp and paper, \$100,000,000 (4,500); sawmills, \$19,290,000 (4,478); fish processing, \$17,520,500 (2,769).

Mining.—By early 1954, 37,000 claims had been staked in the Bathurst lead-zinc-copper-silver area, which held an estimated total of 100,000,000 tons of ore. In 1954 uranium was discovered near Harvey. Tungsten was the first of the new discoveries to arrive at marketing stage in the final weeks of 1954, at Burnt Hill. In 1953 coal was the leading mining operation, with total production of 483,720 tons, valued at \$5,818,500.

(J. M. Str.)

New Caledonia: see PACIFIC ISLANDS, FRENCH.

Newfoundland and Labrador. A province of Canada, Newfoundland joined the confederation in 1949. Area: Newfoundland Island, 42,734 sq.mi.; Labrador, about 112,000 sq.mi. Pop.: Newfoundland (1951) 361,416, Labrador (1951) 7,890; in Oct. 1955 the official estimate for both was 416,000. The capital is St. John's, pop. (1951) 52,873; largest towns are (1951 pop.) Bell Island 10,291; West Corner Brook 6,831; Wabana 6,460.

History.—During 1955 the United States military installations in Newfoundland continued to be a potent factor in aiding prosperity. It was estimated by U.S. air base authorities that their total expenditures in the Newfoundland area during 1955 would amount to \$27,337,249. This was broken down into pay-rolls \$15,893,920, purchases \$6,291,608, contract \$1,106,954, personal expenditure \$4,944,764.

Mining operations increased in 1954-55, partly because of the completion of a 9,000-ft. trans-island conveyor belt and heavy-media separation plant at Wabana, Bell Island, the oldest iron-ore mine in Newfoundland. The government called a special session of the legislature in October to get authority to back a bond issue for the Canadian Javelin company to the amount of \$16,500,000. This was to pay for the cost of the spur railroad, running from the iron-ore company's common carrier between Knob lake and Sept Îles. The spur line to connect with Javelin's new iron mine at Lake Wabush would be 45 mi. long. The estimated amount of ore in the region totalled more than 1,000,000,000 tons. An arrangement was announced by Premier J. R. Smallwood for a gypsum mill, which would be controlled by a British company known as Bellrock Gypsum Industries Ltd.

The Liberal government had been in power since 1949 under Premier J. R. Smallwood, who was also minister of economic development. The lieutenant governor was Sir Leonard C. Outerbridge; chief justice, Sir Albert Walsh.

Education.—In 1954 there were 93,000 students and about 2,700 classrooms with 2,650 teachers. A new \$10,000,000 university was contemplated, the site having been chosen and plans prepared. The education department had \$7,900,000 operating expenses in 1954.

Public Health and Welfare.—In 1954 there were slightly more than 1,600 general hospital beds in Newfoundland, 54 in nursing stations and 431 in cottage hospitals. There were slightly more than 700 beds at the mental hospital. Payments for family allowances totalled in 1955 more than \$1,000,000 per month, 173,395 children having received \$1,039,521 in November. There were 886 children added to the list that month. During 1955 a total of 15,693 old-age pensioners received \$7,082,969. Mothers' and dependents' allowances for fiscal year 1954-55 amounted to \$2,300,000; child welfare, \$250,000; blind persons' allowances, \$158,000; old-age assistance, \$1,825,000; disabled persons, \$336,000; home for aged and infirm, \$151,500; orphanage grants, \$60,000.

Transportation and Communication.—The main transportation service is Canadian National railways, spanning the island with a 547-mi. narrow-gauge line. In 1954 the total tonnage of freight carried was 123,698 tons. In 1954 there were 6,288 mi. of roads, all classes. For the year ending Oct. 30, 1955, there were 26,150 automobiles, 11,016 commercial vehicles and 43,326 drivers. There were 50,100 radio sets and 6,000 television sets. The first TV commercial station opened in Sept. 1955 in St. John's.

Banking and Finance.—Bank clearings of the 48 banks during the 1954-55 fiscal year totalled \$326,813,394. Revenue and expenditure for the province on current account were, respectively, \$39,200,300 and \$35,540,200, and there was a surplus of \$5,690,100. On capital account there was a deficit, revenue being \$3,953,900 and expenditure \$17,492,500. The funded debt in 1953-54 was \$15,000,000 less sinking fund assets of \$1,374,216.

Agriculture, Fisheries, Furs and Forests.—Farm population constitutes

only about 6% of total population and agricultural income is calculated at less than 4% of total income, according to the royal commission on agriculture.

There were 626,357,540 lb. of various types of fish landed in 1955 valued at \$15,111,791. In 1955 there were 17 filleting and freezing plants.

The multimillion-dollar mink industry expected to produce 25,000 mink in 1955 and 50,000 in 1956. The seal fisheries yielded 55,561 sealskins or pelts in 1955. There was not much activity in fur trapping. Sawmills produced 61,000,000 bd.ft. in 1955, much of which was low-grade lumber. Exports of newsprint in 1953 were valued at \$59,145,874; exports of sulphite pulp \$5,500,000. A total of 8,000 men earned a little more than \$22,000,000 in 1953 in woods operations.

Mining.—Mineral production in Newfoundland and Labrador in 1954 was valued at \$44,569,000. The leading mineral products were zinc, iron, lead and copper. Fluorspar, lime and gypsum were also exploited.

(Ec. A. S.)

New Guinea: see NETHERLANDS NEW GUINEA; PAPUA-NEW GUINEA; TRUST TERRITORIES.

New Hampshire. One of the New England states of the United States and one of the original 13, New Hampshire is popularly known as the "Granite state." Area: 9,304 sq.mi., including 287 sq.mi. of inland water. Estimated population, July 1, 1955, was 553,000. At the time of the 1950 census, 306,806 persons, or 57.5% resided in urban territory and 226,436, or 42.5% in rural territory. There were 532,275 whites (of whom 58,134 were foreign-born) and 96,000 nonwhites in 1950. Capital: Concord, with pop. (1950) 27,988. Other cities: Manchester 82,732; Nashua 34,669; Portsmouth 18,830; Berlin 16,615; Dover 15,874; and Keene 15,633.

History.—The legislature met in its regular biennial session from Jan. 5 to Aug. 6, 1955. Among the measures passed were acts to continue the state investigation of subversive activities; authorized in 1953; to raise the state minimum wage from 60 to 75 cents an hour; to impose more stringent restrictions on campaign contributions and spending; to create a \$1,000,000 Industrial Development authority to attract new industries to the state; to authorize funds for a constitutional convention to meet in May 1956, the members to be elected in March 1955; to continue the \$5 head tax; and to pay a \$100 bonus to veterans of the Korean war. As in previous sessions, considerable attention centred upon means of increasing the state's revenue. Perennial proposals for the establishment of state sales and income taxes were rejected as was a bill for the establishment of a state lottery. A bill for the establishment of a state sweepstakes based on racing was vetoed by the governor. A proposal to reduce the size of the lower house of the legislature was also defeated. The assembly voted a record budget of \$90,139,200 for the period from July 1, 1955 to July 1, 1957.

Town meetings were held in 223 towns on March 8, at which straw votes were taken on a proposal for a sales tax. Newports and Lancaster voted to retain their town manager form of government while Seabrook rejected the town manager plan.

State officers in 1955 were: governor, Lane Dwinell, elected in Nov. 1954; secretary of state, Enoch D. Fuller; state treasurer, Alfred S. Cloues; adjutant general, Col. John Jacobson Jr.; commissioner of education, Austin J. McCaffery; commissioner of agriculture, Perley I. Fitts.

Education.—In 1953-54 there were an estimated 82,711 pupils enrolled in 546 public schools in the state of which 63,459 were in grades from kindergarten through eighth grade and 19,252 in grades nine through twelve. There were 39 rural schools, 414 elementary schools, 11 approved junior high schools, 61 senior high schools and 21 junior-senior high schools. There were 3,365 teachers, including 2,088 elementary and 1,277 high school teachers. Total payments covering expenditures of school districts for the year 1952-53 were \$21,225,989.61, including \$1,111.42 for general expenses, \$6,583,281.66 for high schools and \$13,596.53 for elementary schools. In 1949-50 Catholic parochial elementary schools had a total registration of 19,306, while other private elementary schools had a registration of 683. The total number of students enrolled in approved public academies, accredited secondary schools and other private secondary schools in the same year was 6,440.

Other state educational institutions were the University of New Hampshire at Durham; Keene Teachers college at Keene; and Plymouth Teachers college at Plymouth.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of July 1955 the numbers and categories of cases receiving di-

relief and public assistance under the Social Security act were as follows: general relief, 2,326 cases with expenditures of \$118,894; old-age assistance, 5,855 for the month with expenditures of \$353,364; old-age aliens, \$7, with expenditures of \$21,018; aid to dependent children, 1,005 families representing 2,698 children, with expenditures of \$122,755; aid to needy blind, 272 cases, with expenditures of \$16,888; aid to permanently and totally disabled, 239 cases, with expenditures of \$16,240. Total expenditures for public assistance and total obligations for direct relief were \$649,159 for July 1955 compared with \$639,111 for Aug. 1954 and \$701,696 for Jan. 1955. In the fiscal year 1954 New Hampshire received \$3,679,000 in federal grants for public assistance while in the same year payments by the state to recipients of public assistance amounted to \$7,332,000. The sum of \$5,680,000 was collected in contributions for unemployment insurance in 1954 and \$8,597,000 was paid for benefits. Funds available for benefits as of Dec. 1954 amounted to \$10,066,000.

The net appropriation for the operation of the state prison at Concord for the fiscal year ending June 30, 1955, was \$305,492; and for the Industrial School for Committed Minors at Manchester, \$280,796. As of Dec. 31, 1953, there were 193 persons in New Hampshire prisons and reformatories.

Communications.—At the end of 1953 there were 12,374 mi. of rural roads in New Hampshire, including highways under state, local and federal control. Disbursements from state highway funds for 1953 amounted to \$19,590,000. In 1953 there were 907 mi. of steam railways owned by the state compared with 936 in 1950. At the close of 1953 there were approximately 40,000 business and 113,000 residential telephones in operation.

Banking and Finance.—As of Oct. 7, 1954, there were in New Hampshire 10 national banks with deposits of \$223,598,000 and assets of \$249,503,700 compared with 51 banks with deposits and assets respectively, on April 15, 1954, of \$204,681,000 and \$230,037,000. Fifty-eight state-chartered banks had on June 30, 1955, deposits of \$452,041,126 (not including commercial deposits, Christmas clubs and school savings) and assets of \$547,155,782, compared with 58 institutions reporting deposits and assets, respectively, of \$417,161,837 and \$504,773,553 on June 30, 1954. There were 21 state-chartered building and loan associations with assets of \$41,072,626 compared with 24 institutions with assets of \$41,700,751 for the year 1954. There were two federal savings and loan associations with combined assets of \$47,761,553. As of June 30, 1954, 53 state-chartered savings banks and savings departments of trust companies reported assets of \$482,448,213, an increase of \$33,883,377, or 7.55% over the previous year.

Cash receipts of the state treasury department for the fiscal year ending June 30, 1955, were \$88,308,860; cash disbursements \$79,854,035. Cash balance, June 30, 1955, was \$8,454,825, as compared with a cash balance on June 30, 1954, of \$18,443,039. The bonded and note indebtedness on June 30, 1955, was \$40,215,000.

Table I.—Principal Crops of New Hampshire

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	672,000	645,000	567,000
Oats, bu.	156,000	120,000	211,000
Hay, tons	413,000	383,000	404,000
Potatoes, bu.	1,034,000	988,000	1,137,000
Apples, bu.	1,460,000	800,000	883,000

Agriculture.—The estimated acreage from which crops were harvested in 1954 was 246,583 as compared with 290,199 in 1949. Cash receipts in 1954 from farm marketings (including crops and livestock and livestock products) were \$67,400,000 as compared with \$72,800,000 in 1953. Government payments in 1954 were \$300,000 as compared with \$500,000 in 1953. New Hampshire escaped the most severe damage suffered by New England from the hurricanes of August and September.

Manufacturing.—There were estimated to be 1,075 manufacturing establishments in New Hampshire as of Sept. 1950. In 1953 the average number of all employees was 88,771, to whom wages and salaries amounting to \$272,833,000 were paid. The estimated value added by manufactures in the same year was \$427,126,000. The principal categories of manufactures were textiles, lumber products, paper, leather and leather products and machinery. There were 7,000 persons unemployed in mid-June 1955, or about 4,400 less than in June 1954. (W. E. Ss.)

Table III.—Mineral Production of New Hampshire

	1952		1953	
Mineral	Quantity	Value	Quantity	Value
Sand and gravel (short tons)	3,200,000	\$1,002,000	2,249,000	\$ 506,000
Crushed stone (short tons)	70,000	546,000	77,000	539,000
Other minerals	...	397,000	...	760,000
Total		\$1,945,000		\$1,805,000

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in New Hampshire in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953, New Hampshire was second among the states in the production of mica and stood 46th in the value of its mineral output, with 0.01% of the U.S. total.

New Hebrides. This Anglo-French condominium, the British element of which is within the jurisdiction of the western Pacific high commissioner, consists of a group of about 30 islands and many islets. (See PACIFIC ISLANDS, BRITISH.) Area: about 5,700 sq.mi. Pop.: (1952 est.) native 48,500, mainly Melanesians, nonnative 4,160, incl. 372 British, 1,311 French and 2,320 French protected (Indochinese labourers); (1954 est.) 52,120. Religion: mainly pagan. Capital, Vila (pop. 4,000). On Efate Island resident commissioners in 1955: British, H. J. M. Flaxman and (from July) J. S. Rennie; French, Marcel Agostini.

History.—During 1955 a condominium leprosarium was opened. Plans were made for the construction of a new wharf at Luganville, Santo. (J. J. Ty.)

Education.—Schools (1954): British government and aided 2; French government and aided 5; several British missions schools; French mission 2; secondary (mission) 1, pupils 25; pupils (all schools, 1952) 5,464. Teachers in training (British 1952) 204.

Budget.—Currency: sterling, Australian and New Hebridean franc (£A125=£100 sterling; £1=178 New Hebridean fr.; £A1=142.40 New Hebridean fr.). Condominium budget (1954 revised est.): revenue £278,000; expenditure £304,000. British administration budget (1954-55 est.) revenue £A8,470; expenditure £A74,294. French administration budget (1954 actual): revenue 27,667,000 fr. N.H.; expenditure 27,667,000 fr. N.H.

Foreign Trade.—(1954): Imports £1,143,841, including £672,242 from Australia, £151,041 from France, £189,078 from the U.K. Exports £1,660,558 including £1,574,840 to France, £67,477 to Australia (copra 543 long tons; cocoa 735 long tons; coffee 162 long tons; trochus shell 98 long tons.)

New Jersey. New Jersey, the "Garden state," is one of the northeastern states of the United States bordering the Atlantic ocean. It was the third state to enter the union, approving the constitution on Dec. 18, 1787. It has an area of 7,836 sq.mi. of which 314 sq.mi. are inland water. The population in 1950 was 4,835,329, of which 86.6% was urban and 94.3% was white. Official estimates placed the July 1, 1955, population at 5,370,000. The capital is Trenton, which had a population of 128,009 in 1950. Other large cities were Newark 438,776; Jersey City 299,017; Paterson 139,336; Camden 124,555; and Elizabeth 112,817.

History.—Some of the more important measures approved by the legislature and the governor in 1955 were a measure designated as the New Jersey Water Supply Bond act, which authorized a \$100,000,000 bond issue for acquiring, constructing and developing the New Jersey water supply system (defeated in a referendum at the general election in Nov. 1955); a law establishing a five-member bipartisan board to acquire and operate the New Jersey water supply system; a measure increasing the maximum weekly benefit rate under the unemployment compensation law from \$30 to \$35; a law establishing a research and training centre to conduct research in the field of mental deficiency and appropriating \$1,500,000 to the purposes of this act; a measure revising the pension system for teachers and providing for coverage under the Federal Social Security act; a measure authorizing and directing the commissioner of health to purchase and distribute sufficient quantities of poliomyelitis vaccine to inoculate children for whom free vaccine is not available from the National Foundation for Infantile Paralysis or who are unable to pay the cost thereof; a law establishing an 11-member rehabilitation commission to administer and supervise vocational rehabilitation in the state; a law authorizing the governor to execute a compact on behalf of New Jersey with any other state or states relative to the supervision of delinquent juveniles on probation or parole, the return of escaped juvenile

delinquents or the return of nondelinquent juveniles who have run away from home.

In the general election held Nov. 1954, Clifford P. Case (Rep.) was elected to the U.S. senate.

The chief officers during 1955 were Robert B. Meyner, governor; Edward J. Patten, secretary of state; Grover C. Richman, attorney general; Archibald S. Alexander, state treasurer; Charles R. Howell, commissioner of banking and insurance; Joseph E. McLean, commissioner of conservation and economic development; and Arthur T. Vanderbilt, chief justice.

Education.—Public-school day enrolment totalled 589,144 for grades kindergarten through 8 in June 1955; enrolment for grades 9 to 12 (including grades 7 and 8 in junior high schools) was 209,683, and for special classes 8,170. The 4 universities, 10 liberal arts colleges, 8 professional and technical colleges and 10 junior colleges had a combined enrolment of 22,067 full-time and 17,557 part-time students in 1954. The 6 state teachers' colleges had a total enrolment (full and part-time) of 7,458 in 1955 while the 27 professional and technical institutes had 4,022 full-time and 2,777 part-time students. The public day school expenditures (excluding capital expenditures) for fiscal 1953-54 were \$233,639,000. The state commissioner of education was Frederick M. Raubinger.

Social Insurance and Assistance, Public Welfare and Related Programs.—In July 1955 the state's welfare system cared for 14,506 patients in institutions for the mentally ill, while the county hospitals cared for an additional 6,538. The state institutions for the mentally deficient contained 5,121 patients; tuberculosis sanatoria had 2,294 patients; 691 students were in training schools for juvenile delinquents and 215 veterans were in soldiers' homes. Old-age assistance recipients numbered 20,252 in July 1955. The number of children assisted by the board of child welfare totalled 22,681; 877 received aid for the blind and the number of general assistance recipients was 18,958. The state prison, three prison farms and three reformatories for adult offenders contained 3,976 inmates. Benefit payments to the jobless totalled \$7,000,997 during July 1955.

Communications.—The total highway mileage of New Jersey on Jan. 1, 1954, was 28,987, of which 6,000 mi. were unimproved. State and federal funds disbursed for roads totalled \$62,297,058 during the fiscal year 1954-55. Motor vehicle registrations totalled 1,953,502 in 1954. The 23 railroads operating within the state had a track mileage of 5,317.90 and a line mileage of 1,970.85 on Dec. 31, 1954. Civil, commercial and municipal airports numbered 78 as of July 1, 1955.

Banking and Finance.—Deposits of the 134 institutions under the supervision of the state department of banking and insurance amounted to \$3,518,248,000 on June 30, 1955, an increase of \$197,402,000 over the previous June 30. The deposits of 111 commercial institutions were \$2,540,184,000, an increase of 4.6%, while the deposits in 23 savings banks showed \$978,064,000, an increase of 0.6%. National banks in New Jersey numbered 196 on Dec. 31, 1954, with total assets of \$3,272,125,000. The 455 building and loan and savings and loan associations had assets of \$1,153,408,033 on Dec. 31, 1954. State revenues for fiscal 1954-55 were \$500,341,096 and expenditures totalled \$506,701,627; the state's bonded debt was \$114,990,000 as of June 30, 1955.

Agriculture.—Combined harvested acreage of all New Jersey crops in 1954 was 811,290 ac. Cash income from crops amounted to \$120,100,000,

from livestock \$216,726,000, and from government payments \$872,000. Total value for staple crops amounted to \$53,392,000; the value of commercial vegetable crops (excluding potatoes) totalled \$47,839,000.

Manufacturing.—Wages paid to manufacturing workers in 1954 totalled \$3,425,467,068; for the first quarter of 1955 they amounted to \$854,419,091. The number of manufacturing workers averaged 774,027 during the first quarter of 1955. (R. H. M.)

Mineral Production.—Table III shows the tonnage and value of the mineral commodities produced in New Jersey in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 New Jersey was fourth among the states in the production of zinc and ranked 34th in the value of its mineral output with 0.36% of the U.S. total.

New Mexico. A state in southwestern United States, popularly known as the "Sunshine state," New Mexico was admitted to the union in 1912. Area: 121,666 sq. mi. (121,511 sq. mi. land, 155 sq. mi. water); pop.: (July 1, 1955 est.) 769,000; (1950 census) 681,187; rural 339,298; urban 341,889; white 630,211; nonwhite 50,976. Capital, Santa Fe (1950 pop.) 27,998. Other cities: Albuquerque (96,815); Roswell (25,738); Carlsbad (17,975); Clovis (17,318); Hobbs (13,875); Las Cruces (12,325).

History.—The state elective administration, legislature and congressional representation were Democratic during 1955. The chief officers of the state were: governor, John F. Simms, Jr.; lieutenant governor, Joseph M. Montoya; secretary of state, Natalie Smith Buck; auditor, J. D. Hannah; treasurer, Joseph B. Grant; attorney general, Richard H. Robinson; superintendent of public instruction, Mrs. Georgia L. Lusk.

The 1955 legislature provided for legal death by gas, more rigid control for small loans, regulation of securities, anti-race segregation, a minimum wage, absentee voting and a closer primary, and declared state official symbols the following: yucca flower, chaparral (road runner) bird, nut pine or piñon tree and native cutthroat trout.

State constitutional amendments increased the membership of the house of representatives to 66, made the highway commission financially responsible to the legislature, provided direct legislative control for the state penitentiary, miners' hospital, insane asylum and boys' reformatory and renamed the asylum New Mexico State hospital and the reformatory New Mexico Boys' school.

Education.—For the school year 1953-54, 4,916 teachers served municipal schools at an average salary of \$4,101.43; pupils numbered 144,563. In rural schools 1,220 teachers earned an average salary of \$3,714.09; pupils numbered 28,705. Total expenditures for municipal and rural schools were \$39,257,327.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the fiscal year ending June 30, 1955, \$5,753,162.50 was expended for old-age assistance; \$5,564,228.50 for dependent children; \$202,670. for needy blind; \$787,889.50 for the disabled; \$170,180.22 for general assistance; \$811,747.18 for medical care; \$249,755.32 for child welfare services; \$124,268.99 for crippled children. A total of \$4,102,138 was paid for unemployment compensation; \$646,572 for veterans' unemployment compensation and \$110,431 for federal employees. For the same fiscal year, an estimated \$9,089,000 was paid for old-age and survivor insurance.

The penitentiary appropriation was \$951,564 for 696 inmates (September); insane asylum, \$1,375,000 for 1,050 inmates (Sept. 1); Los Lunas mental hospital, \$166,360 for 127 inmates (September); girls' welfare home, \$248,000 for 146 inmates; industrial school for boys, \$244,195 for 79 inmates (Sept. 1).

Communications.—New Mexico had an estimated 50,523 mi. of surfaced highways and 12,042 mi. of surfaced roads in 1955. For the fiscal year ending June 30, 1955, the state highway department expended \$30,528,423.15 plus \$2,116,205 for debt service.

Steam railway companies operated 2,536 mi. of main track (1955).

Table I.—Principal Crops of New Mexico

Crop	Indicated 1955	1954	Average, 1944-53
Wheat, bu.	1,408,000	1,318,000	1,550,000
Barley, bu.	1,302,000	643,000	3,153,000
Oats, bu.	725,000	594,000	754,000
Corn, bu.	726,000	525,000	526,000
Sorghum grain, bu.	5,751,000	2,660,000	3,693,000
Hay, tons	532,000	512,000	436,000
Alfalfa, bales	240,000	316,000	217,000
Beans (100-lb. bags)	222,000	216,000	323,000
Peas, bu.	650,000	760,000	592,000
Nuts, lb.	6,250,000	6,600,000	7,904,000

Total	330,829,000		288,500,000	

Value included with other minerals.

There were 3 scheduled air carriers, 102 airports and airfields, 1,530 mi. of controlled coloured airways and 2,296 mi. of very-high-frequency bidirectional range airways. There were about 174,000 telephones.

Banking and Finance.—On Dec. 31, 1954, there were 26 national banks with total deposits of \$346,110,900.72; loans \$107,086,773.67; investments \$155,680,437.46. The 27 state banks had deposits of \$138,416,552.9; loans \$45,512,929.03; investments \$57,063,832.95.

Total resources of 14 building and loan associations in 1954 were \$26,894,13 and of 7 federal savings and loan associations, \$45,764,11.43.

The total of all state receipts for the fiscal year ended June 30, 1955, was \$179,161,552.68; total disbursements \$180,297,543.43.

Agriculture.—The total value of agricultural production in 1954 was \$1,158,000; acreage harvested 1,293,000. Livestock was estimated at 27,679,000 (Jan. 1, 1955).

Manufacturing.—Estimates on manufacturing for 1954 were: workers, 183; wages and salaries, \$71,966,000; value of products, \$291,480,000. (F. D. R.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in New Mexico in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 New Mexico was first among the states in output of potash and pumice, fourth in copper, borax and molybdenum, and rated 11th in the value of its mineral output with 2.30% of the U.S. total.

Newspapers and Magazines. U.S. Newspapers.—

The leading newspaper of 1955 was that of the 103-year-old *St. Louis Globe-Democrat* and its radio station KWK in March for \$6,250,000 to Samuel I. Newhouse, who owned 12 other newspapers. The *Charlotte (N.C.) Observer* was bought Dec. 30, 1954, for \$1,000,000 by John S. Knight, who owned four other newspapers. The *Augusta (Ga.) Herald* was acquired in May for \$1,517,000 by William S. Morris and merged with his *Chronicle*. A new newspaper, the *State Times*, was launched in February 1955. 800 citizens of Jackson, Miss., who raised \$1,000,000 for the purpose as a protest against the older *Clarion Ledger* and *Daily News*. The tabloid *New York Graphic* was revived in June as a weekly by Bernarr Macfadden, who started it first in 1924 and suspended it in 1932. The *Wall Street Journal* in February opened a plant for a Washington, D.C., edition—the fifth city in which it had plants.

The 114-year-old *Brooklyn Eagle* was suspended in March by Frank D. Schroth after a 47-day guild strike. The *Los Angeles Daily News* was suspended in Dec. 1954 by Clinton D. McKinnon, and its name sold to the *Times-Mirror*. The last newspaper at Park row, former famous New York newspaper street, late 1954 when the 120-year-old *Staats-Zeitung Und Herold* moved uptown. The *Philadelphia Evening Bulletin* moved into a huge new building on June 1, celebrating 60 years of ownership by the McLean family.

The *Chicago Daily News* announced in August plans to build an \$11,000,000 addition to its skyscraper building to house 66 new presses, while the 42 presses discarded by the *New York Daily News* in a \$10,000,000 replacement project were bought by the *Boston Post* and the *Long Island Newsday*. In the final settlement of the will of William Randolph Hearst in May, all the newspapers, magazines, radio stations and syndicates, valued at \$78,000,000, were combined under 13 trustees of the Hearst corporation.

Newspaper advertising, after a slight drop late in 1954, went into record-breaking totals in 1955; national advertisers bought 9.5% more space in the first six months than in any previous comparable period. The notable months were March, up 12.2%, May, up 11%, and June, up 15.9%. National advertisers bought \$601,000,000 worth of space in 1953, slipped 1.2% to \$594,000,000 in 1954 but in 1955 were exceeding the 1953 rate. Automobile advertising led the increase. Advertising rates continued to rise; 113 newspapers in the Inland Daily Press association reported rates up 3% in the year and up 40% in the last ten years. Colour advertising became a regular feature in 560 daily newspapers with 70% of the circulation, and more advertisers were using coloured comic advertisements. After a drop because of the lung cancer scare, cigarette advertising rose 8.75% in 1955, promoting king-size and filter-tipped cigarettes. Newspapers profited when the post office on March 31 ended its 15-month "junk mail" experiment of letters addressed to "Occupant."

Total daily circulations, which reached 55,072,480 in 1954 with a gain of 600,194 above 1953, continued to rise in 1955; one midyear survey showed morning papers up 2.17% and evening papers up 1.40%. The number of English-language dailies decreased by 20 to a total of 1,765 on Jan. 1. About 25% of the dailies had become five-day papers, dropping Saturday or Monday. All surveys showed television having little effect on newspaper reading, although it might have held circulation gains below the population growth. In profits, small dailies below 25,000 circulation were faring better than large city papers in which costs rose faster than income. Because increased advertising made larger editions, paper consumption increased sharply, up 8% by May; the total reached 400,000 tons a month or 2,875,000 tons in the first seven months. Although Canadian mills increased output, production barely kept up. Newsprint production in the U.S. was increasing to balance foreign demands on Canadian mills. New mills, financed by newspapers, were opened at Calhoun, Tenn., and Boca Raton, Fla., using southern hard pine.

The most notable newspaper legal case of the year was the antitrust suit against the *Kansas City Star* and *Times* for unfair monopoly practices in advertising. After an indictment on Jan. 6, 1953, hearings started in federal district court on Jan. 17, 1955; 109 witnesses were heard, and on Feb. 22 the jury found the newspaper and its advertising director, Emil A. Sees, guilty—facing fines of \$5,000 and \$2,500. The case was to be appealed. In April the federal department of justice started antitrust suits against the American Newspaper Publishers association and six other trade groups, charging illegal price-fixing in the 114-year-old system of "recognition" and 15% commission of advertising agencies.

Contrasting opinions were returned in the New York federal appeals court in the case of Minot F. (Mickey) Jelke, convicted in Feb. 1953 of compulsory prostitution in a trial in which newspapers were barred part of the time; one decision on May 18, 1954, freed him on the grounds that he had been denied "open court"; in another suit, the same court ruled on Dec. 31, 1954, that newspapers were "outsiders" with no legal right to demand open trial. Efforts to bar photographers from court-

rooms, led by the Ohio supreme court and the American Bar association, resulted in conflicts between judges and newspapers in various cities—Greensburg, Pa., Phoenix, Ariz., and others. After the sensational murder trial of Samuel H. Sheppard in Cleveland, O., the judge declared that the excessive publicity had not influenced the jury. The Mississippi supreme court declared in June that a carrier boy is not a "little merchant" exempt from workmen's compensation.

It was a quiet year on the labour front; the only important strike was the guild walkout that ended the *Brooklyn Eagle*. The photoengravers' union and the I.T.U. printers' union sought jurisdiction over new electronic phototype and engraving processes. The *New York Times* in July discharged a copyreader who pleaded the fifth amendment before a senate committee investigating an alleged communist cell of newspapermen in the 1930s; the Newspaper guild had in June voted not to defend former communists in its ranks. An innovation was the growing use of vending machines to sell newspapers. Such machines were in use in more than 50 cities. Another was phototype "cold type," which was under experiment to cut composition costs.

The advertising industry proposed in August a campaign to mobilize its forces against juvenile delinquency. The Associated Press in April reported its present membership as 1,744 newspapers and 1,376 radio and television stations. Frank H. Bartholomew on April 6 succeeded Hugh Baillie as head of United Press. A press corps of 1,500 gathered at Geneva, Switz., in July for the meeting of the heads of state of the Big Four Powers, although the sessions were closed.

About 60 newspapers, with 14,000,000 circulation, sponsored a national spelling bee in May. The *Chicago Tribune* in August abandoned the simplified spelling that it had used for many years. The famous syndicated cartoon, "Toonerville Trolley," ended its 47-year run on Feb. 12 when Fontaine Talbot Fox, artist, retired at 71.

Magazines.—"Do-it-yourself" projects were the most novel new features in magazines in 1955. Another was the newsstand success of 14 "peephole" gossip magazines; the leaders were *Whisper*, selling 4,000,000 copies, and *Confidential*, selling 2,200,000 copies, which was barred from the mails in August. One of the most interesting events of the year was the appearance of the *Reader's Digest* in April with 32 pages of advertising, at \$31,000 a page, after 33 successful years without advertisements. New magazine titles were *TV Program Week* and a quarterly *Bride-To-Be*, both launched by Curtis Publishing company. The *New York Herald Tribune* started a Sunday radio and TV magazine, while Annenberg's *TV Guide* led the field with 3,000,000 sales. Comic books, while dropping from 422 to 335 titles, still held 35% of newsstand sales. Davy Crockett was fully exploited. Twenty-three comic-book publishers employed a code czar to reduce emphasis on crime and sex.

Most magazines faced falling newsstand sales and raised the subscription ratio from 53% to 70%. Supermarkets became an outlet for magazines. Paperback books reached 240,000,000 sales, began taking advertisements in covers and started a quarterly *Pocket Book Magazine*. Advertising in magazines increased from 5% to 30%, bulking more than \$600,000,000 for the year, with automobiles leading. But increased income did not meet rising costs; in the last ten years, while magazine sales had risen 24% and copy prices 30%, average profits dropped from 8.3% to 2.8%. Costs had risen thus: typography 91%, presswork 105%, photoengraving 86%, mailing 127%.

An antitrust suit against American News company and Union News company, distributors, threatened, while a proxy fight started in these firms, which also operate railroad restaurants and checkrooms. A McGraw-Hill export catalog listed 750 United States magazines selling in 63 countries. A new Catholic

press directory listed 350 publications with 20,000,000 sales.

(G. M. HY.)

Photojournalism.—Goals of press photographers in the U.S. continued to include revision of the American Bar association canon 35 which bans news cameras in courtrooms; development of better educational resources for both practising and student news photographers; protection of photographers' civil rights against "self-appointed censors" who in past years had subjected numerous cameramen to physical attack; and the quick dissemination of information on new photographic techniques and products.

A demonstration of the ability of press photographers to take pictures under courtroom conditions, unobtrusively and without artificial light, was made at the American Bar association convention in Philadelphia in Aug. 1955. Earlier, members of the National Press Photographers association had conducted a similar demonstration for editors and publishers at the American Society of Newspaper Editors meeting in Washington, D.C.

Eighteen photojournalism short courses were conducted in 1955 at colleges and universities from coast to coast. The N.P.P.A. also worked with college curriculum supervisors on improvement of undergraduate courses of study in pictorial communication. Initial subjects in an audio-visual library of press photography were distributed for use by local press photography organizations, including slides and tape recordings. More significant talks given at the short courses. (J. CA.)

Canada.—Counting as one those morning and evening papers published by the same owner, there was in 1955 a total of 100 daily newspapers in Canada, with circulation at end of March an all-time high of 4,454,518. Approximately 60 were equipped to use colour. By the beginning of 1956 the *Weekend magazine* originated by the *Montreal Standard* in 1951, was appearing in 28 week-end editions with a combined circulation of more than 1,450,000. Thomson Newspapers added the *Sudbury Star* (daily) and the *Oakville-Trafalgar Journal* (weekly) to a string which included 21 dailies and 4 weeklies. The Canadian Press was headed for a second term by R. J. Rankin, *Halifax Chronicle* and the Canadian Daily Newspapers association elected as president Emile Castonguay, *L'Action Catholique*, Quebec. National newspaper awards included: editorial writing, C. B. Pyper, *Toronto Telegram*; feature writing, Mac Reynolds, *Vancouver Sun*; staff correspondence, Bill Boss, the Canadian Press; sports news, Gwyn Thomas, *Toronto Star*; feature photo, Ray Munro, *Vancouver Province*; cartoon, John Collins, *Montreal Gazette*. In the weekly field the *Brampton Conservator* won top standing as the best all-round newspaper of 3,000 or more circulation; the *Oakville-Trafalgar Journal* was first in the 2,000 class and the *Acton Free Press* in the 1,000 group.

John Vopni, publisher of the *Davidson* (Sask.) *Leader*, was elected president of the Weekly Newspaper association. The *Thorold Post* (weekly) ceased publication after being published by the Thompson family for 70 years. Membership of the American Newspaper guild in Canada increased by 450 to 1,510.

(B. T. R.)

Great Britain.—During 1955 the British press suffered its longest and most severe industrial dispute in its history. The only comparable event in the past was the general strike of 1926, but whereas on that occasion all the unions struck, this time only 2 out of the 14 unions concerned with the press stopped work. The strike began on March 25, when 700 maintenance engineers and electricians withdrew their labour because of a wage dispute. There were no evening newspapers in London on that day and for the next 26 days until April 21, when the newspapers appeared again, virtually the whole national press in London was silent. The newspapers involved were all members of the Newspaper Proprietors' association and they included

the London national morning, evening and Sunday newspapers with the single exception of the *Daily Worker*, the communist newspaper. Where newspapers were published in Manchester and Glasgow by N.P.A. members, these also were prevented from publishing. The *Times* failed to appear for the first time since its beginning in 1785.

A railway strike which lasted for 17 days in June also had its adverse effect on the press. Newspapers were compelled to distribute by road, which limited the tonnage which could be sent out, and there was a temporary return to six- and eight-page issues with the corresponding loss of advertising revenue.

It was announced that newspapers were to be freed from government control in March 1956, when it was expected that a greater tonnage of newsprint would be available, both from overseas and home mills.

Woman's Sunday Mirror, sponsored by Sunday Pictorial Newspapers, made its appearance in January, the first new Sunday newspaper to be launched in London for more than 30 years and the first to be designed exclusively for women. Its circulation soon passed the 1,000,000 mark.

An act was passed to prevent the dissemination of "horror comics." It was made an offense to print, publish, sell or let on hire certain "pictorial publications harmful to children and young persons." The maximum penalty on summary conviction for an offense was to be four months' imprisonment or a fine of £100, or both.

A number of new periodicals appeared during the year, among them the *Agricultural Review* under the editorship of Sir James Scott Watson; *Art*, which aimed to "discuss, explain and comment on art in understandable language"; *Books and Bookmen*; *She*, for the younger woman reader; and two publications dealing with commercial television, *Commercial Television News* and *TV Times*.

Commonwealth.—Journalists in Southern Rhodesia championed the freedom of the press during the passage through parliament of the Public Order bill. The Rhodesia Guild of Journalists objected to a clause in the bill, which, first, made punishable by imprisonment the publication of false reports likely to cause alarm or disturb the peace and second, insisted that it would be no defense to plead ignorance of the falsity of the statement unless it could be proved that reasonable measures had been taken to verify its accuracy. The minister agreed to delete the second part of the clause, thus removing the main objection.

Sydney, Austr., like London, was deprived of all its regular morning and evening newspapers for more than three weeks by an industrial dispute.

R. E. Fitzpatrick and F. C. Browne, owner and editor respectively of the *Bankstown Observer*, were ordered to be committed to prison for three

months by the Australian house of representatives for breach of privilege. The order was later upheld by the high court and the judicial committee of the privy council. A motion for the immediate release was heavily defeated in the house of representatives and the two newspapermen served the full term of three months' imprisonment imposed.

A start was made in India to carry out some of the recommendations of the press commission which had reported in 1954. An act was passed creating a press registrar and requiring all newspapers to give full information as to the names of proprietors, editor, printer and publisher, circulation figures and the average number of pages printed each week. During the passage of the bill attacks were made on newspaper proprietors, but figures showed that nobody controlled more than 9% of circulation and no single newspaper more than 4%. The government decided to ban the publication of foreign newspapers and periodicals in India.

Europe.—The general assembly of the International Press institute was held in Copenhagen, Den., with 170 editors and other journalists from 20 countries outside the "iron curtain" attending. The assembly instructed the secretariat of the institute to inform its members of all cases where press freedom was limited or suppressed. Members were urged to warn governments which threatened press freedom and to defend colleagues who were victimized.

The French periodical *La Quinzaine*, begun in 1950 by a group of young Roman Catholics, ceased publication after it had been proscribed by a decree of the Supreme Congregation of the Holy Office. It was stated by the *Osservatore Romano* that it have often "discussed the complex question of collaboration

tween Catholics and Communists without ever referring to the numerous interventions of the Holy See in this matter." For publishing articles in the French right-wing weekly *Aspects de France* attacking P. Mendès-France, the former prime minister, the editor and the author of the articles were ordered to pay fines totalling £2,100.

In Berlin *Die Neue Zeitung*, the official U.S. German-language newspaper which first appeared in 1945, ceased publication in spite of efforts by the German editorial staff to obtain suitable backing for continuing it. In Frankfurt a family magazine, common to the *Frankfurter Rundschau*, was started under the title *Zeit und Bild*. Statistics published by the Institute of Journalism of the Free University of Berlin showed that in 1954 there were 1,383 daily newspapers in the area of the German Federal Republic which together had a circulation of 15,000,000 copies. There were also 20 west Berlin newspapers with a total circulation of about 1,000,000. The Soviet High commission newspaper, *Tägliche Rundschau*, published in east Berlin since May 1945, ceased to appear. *Die Neuesten Nachrichten* of Saarbrücken was the first pro-German newspaper to be published in the Saar since World War II.

Figures published showed that Italy had 113 daily newspapers with a daily circulation of about 5,000,000 copies, an average of one newspaper for every ten inhabitants. The "responsible directors" of the Italian Communist newspaper *L'Unita* and the Nenni Socialist *Avanti* received fines and prison sentences for libelling the minister of labour and social insurance. (See also ADVERTISING.) (D. HN.)

New York. New York, one of the original 13 states of the United States, is known as the "Empire state." Northernmost of the middle Atlantic states, it covers an area of 49,576 sq.mi. of which 1,647 sq.mi. are water. Population: July 1, 1955, est.) 16,053,000; (1950 census) 14,830,192. The largest cities and their 1950 populations are: New York 7,891,777; Buffalo 580,132; Rochester 332,488; Syracuse 220,583; Albany 152,798; Albany (state capital) 134,995; Utica 101,711; Schenectady 91,785; Niagara Falls 90,872; Binghamton 67,674.

History.—On Jan. 1, 1955, Averell Harriman was inaugurated governor of the state. His inauguration marked the end of 55 years of Republican rule. Other elected state officials during 1955 were: lieutenant governor, George B. De Luca (D.); comptroller, Arthur Levitt (D.); attorney general, Jacob K. Javits (R.).

During 1955 the legislature broadened labour benefits, increasing unemployment insurance payments from \$30 to \$36 a week. Coverage of unemployment insurance was extended to employers of three instead of four or more persons, except domestic servants, and after Dec. 1, 1956, would include firms with two or more employees. Work hours of children under 16 were reduced from 44 to 40 hours a week in factories, mercantile and other establishments. Legislation affecting housing and rent control prohibited discrimination in publicly assisted housing projects because of race, creed, colour or national origin.

New York city's financial problems were recognized by the legislature, which granted broadened taxing powers. The city's temporary authority to tax sales, business and professional services and gross income of utilities was made permanent. A tax increase was authorized on business and professions. On the city's major income source, real estate, the state legislature raised the tax limit from 2¼% to 2½% of average full valuation of taxable property.

In upstate New York the St. Lawrence seaway and power projects, which were under construction, served to stimulate plans for industrial expansion. The first contract made by the

state power authority for use of a block of St. Lawrence power was with the Aluminum Company of America. The contract was for about 25% of the power potential of the project and the Aluminum Company of America announced plans for expenditure of nearly \$27,000,000 to modernize and expand its plant facilities at Massena, N.Y., and make the changes necessary to utilize the authority's power. The authority announced plans for a 2,700-ac. state park in the St. Lawrence valley as a part of the general development of the area.

In August Hurricane "Diane" caused severe rains and floods in southern and eastern areas of the state, taking four lives and causing property damage estimated at \$16,284,000. In mid-October floods caused by heavy rainfalls resulted in damages estimated in the millions of dollars to sections of the Catskills and some upstate counties, notably Schoharie and Schenectady. Rock collapses in 1954 and 1955 damaged Prospect point and Luna Island at Niagara falls. Remedial work was begun to remove dangerous overhangs and permanently protect the falls from further damage.

The New York state thruway, the express highway that was to span the state from Buffalo to New York city, was opened for nearly all of its length during 1955. A three-mile long, \$60,000,000 bridge across the Hudson river between Tarrytown and Nyack to link the thruway with the New York city area was opened on Dec. 15.

Education.—There were approximately 3,275,000 students in New York educational institutions in the school year 1953-54. Of these 2,300,000 were enrolled in public schools. There were 1,453,706 children enrolled in grade 6 and below in public schools and 849,109 in grades 7 through 12. There were approximately 560,000 pupils in the elementary grades and 95,000 in the secondary grades of the private and parochial schools. Enrolment at universities, colleges and other institutions of higher learning in the state in the fall of 1954 was 318,182. The commissioner of education, elected in 1955 by the board of regents, was James E. Allen, Jr.

The State University of New York has administrative jurisdiction over 27 state-supported institutions for higher education. Special state schools include 10 community colleges, 133 schools for nursing, 3 institutes for the blind and 6 for the deaf.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the care and treatment of the mentally ill, mental defectives and epileptics, the state in 1954 maintained 27 institutions, including 18 hospitals, six schools for mental defectives, a colony for epileptics, the New York State Psychiatric institute for research and teaching and the Syracuse Psychopathic hospital for observation and temporary treatment of mental patients. The state also operated three after-care clinics for patients following release from hospitals.

During 1954 the state of New York certified unemployment insurance claims totalling \$290,136,915. On Dec. 31, 1954, the New York State Unemployment Insurance Trust fund had a balance of \$1,267,384,177.

Communications.—During 1955 there were more than 103,000 mi. of improved roads in the highway and street systems in the state. Of these, about 15,000 mi. were in the state system, 18,000 mi. in the county system, 54,000 mi. in town systems and 16,000 mi. in cities and villages. Motor vehicles registered in the state in 1954 totalled 4,363,204, including 3,705,149 passenger cars, 477,001 trucks, 162,508 suburban vehicles and 18,546 buses.

The state maintains a system of more than 500 mi. of inland waterways making up the barge canal system. This incorporates the Hudson and Mohawk rivers and some lakes, providing altogether 800 mi. of navigable routes used by freight and pleasure vessels.

Thirty-six railroads operate a total of 7,500 mi. of single track within New York state.

In 1955 New York state had 263 landing facilities including 214 airports, 37 seaplane bases and 12 heliports. During 1954 the four New York metropolitan airports, New York International at Idlewild (largest airport in the world), LaGuardia, Newark and Teterboro, handled a total of 9,320,838 air passengers. During the first six months of 1955 passenger traffic was up 16.3% over the first half of 1954. During 1954 New York city's four airports also handled 245,559,000 lb. of air cargo and 80,774,500 lb. of airmail.

Banking and Finance.—At the end of 1954 there were 692 banks with total resources of \$59,104,736,000 and deposits of \$52,603,264,000 operating in New York state. In addition, there were 236 savings and loan associations with about \$2,200,000,000 total assets and \$1,862,994,000 due private shareholders.

State revenues during the fiscal year ended March 31, 1955, totalled \$1,159,155,104. Expenditures totalled \$1,158,127,725, leaving an operating surplus of \$1,027,379. Total state debt as of March 31, 1955, was \$682,344,129. Of the state's general fund expenditures, 44% went for operation of the 19 state departments, state commissions and agencies, 60 state correctional and health institutions and 34 educational institutions, as well as the legislature, courts, highway maintenance and construction. The remaining 56% went to localities in the form of state aid for schools, welfare, highways, health and other operations. Tax stabilization reserve funds on March 31, 1955, aggregated \$144,045,310.

Agriculture.—New York state ranked 13th in 1954 in cash receipts from farm marketings of agricultural products, a total of \$816,854,000 being

reported. The 1953 total was \$874,702,000. In addition, government payments to farmers in 1954 were \$3,753,000 compared with \$4,949,000 in the previous year.

Cattle sold for meat were valued at \$53,175,000. Sale of milk and other dairy products in 1954 amounted to \$369,998,000.

The value of livestock and poultry on farms as of Jan. 1, 1955, was \$337,214,000. This included 2,356,000 cattle, 14,887,000 chickens, 73,000 horses, 1,000 mules, 160,000 hogs and 153,000 sheep. Turkeys raised in 1954 totalled 942,000.

Table I.—Principal Crops of New York

Crop	Indicated 1955	1954	Average 1944-53
Corn, bu.	30,573,000	29,568,000	26,326,000

Manufacturing and Industry.—In 1953 the state's manufacturing firms added \$14,410,234,000 in value to the raw and semifinished material they purchased for processing, compared with \$3,313,649,000 in 1939.

In terms of value, New York state produces approximately 67% of the country's total output of women's dresses, coats and blouses, 94% of women's furs and 41% of men's and boys' tailored clothes. The state leads all others in the apparel, printing and publishing, paper and paper products and furniture industries. It produces 66% of the value of photographic equipment manufactured in the nation. The state is also noted as a producer of food products, chemicals, leather goods, optical instruments and lenses, millinery, children's wear, scientific instruments, dolls, costume jewellery and office machines.

Table II.—Principal Industries of New York

	All employees 1953	Salaries and wages 1953 (in 000s)	Value added by manufacture 1953 (in 000s)	Value added by manufacture 1952 (in 000s)

Source: U.S. Department of Commerce, Annual Survey of Manufactures, 1953.

There were 5,856,000 persons employed in the state in 1954, exclusive of agricultural workers, proprietors, domestics and personnel of the armed forces, a gain of 1,678,000 since 1939. Average weekly factory earnings in 1954 were \$71.50. (E. M. De.)

Total		\$186,868,000		\$180,751,000

*Values for processed materials are not included in the totals.

mineral commodities produced in New York in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 New York was first among the states in output of ilmenite and talc, second in salt, third in slate and zinc and fifth in cement, gypsum, iron, sand and gravel; and ranked 19th in the value of its mineral output, with 1.30% of the U.S. total.

New York City. The largest city in the U.S., second in world only to metropolitan London. New York continued to grow, reaching an estimated population of 8,200,000 in mid-1955, in an area of 319.1 sq.mi.

In the second year of Mayor Robert F. Wagner's administration, the 1955-56 fiscal year expense budget totalled \$1,733,325,423.17, a record high for the city. Among the increased expenditures was the sum of \$27,413,151.90 to implement the Career and Salary plan, which, inaugurated in July 1954 and completed one year later, re-evaluated the work of city employees and determined the proper job classification and salary for each.

In Sept. 1955 the city's public schools recorded a net enrollment of 923,505 students. Twenty-four new schools or additions were opened at a cost of \$42,500,000; notable among them was a school to accommodate children suffering from cerebral palsy. Private and parochial school enrollment increased, reaching approximately 325,000 students. The four municipal colleges offered free higher education to about 73,000 students during the school year 1954-55.

The police department in mid-1955 reported a force of 21,800 men, the highest in history. Operation "25," an experiment in the calculation and assignment to a crime-ridden area of the optimum police manpower, was successful in apprehending an increased number of criminals and ultimately in reducing the crime rate. It was then extended to other "trouble" areas in the city, and credit was given to these operations for an over-reduction of crime in the first six months of 1955.

The city's complex transit system of subway and bus lines was put under the professional management of the Transit authority, a three-man, salaried team with expert knowledge in labour management, banking and transportation. The city bid farewell to a 77-year-old landmark, the Third Avenue El, and thus ended the era of elevated railways.

NEW YORK CITY CHILDREN playing in the spray of an open fire hydrant during a hot spell in July 1955

During the year an estimated 13,000,000 visitors were attracted to the city, including delegates to more than 700 conventions, among whom were 600 mayors and their families who attended the national convention of the U.S. Conference of Mayors. Ballet, opera, concerts, light opera, stage plays, motion pictures, television and radio programs and museum exhibitions were the major attractions for the visitors and for the city's own residents. The Summer festival staged special events of particular interest to tourists and successfully counteracted the usual summer slump in business, accounting for a higher percentage than ever before of the \$1,000,000,000 spent by visitors during the year.

New York provided a wide variety of events for the sports enthusiast. It was the scene of two championship boxing bouts, the light-heavyweight and heavyweight divisions. The Davis tennis matches, in which the U.S. lost the cup to the Australian team, and the Nationals, in which the U.S. won in all divisions, were both played at the West Side Tennis club in Forest Hills. In baseball a "subway" series was played between New York Yankees and the Brooklyn Dodgers, from which the Dodgers emerged as world champions. (W. R. Pr.)

New Zealand. A realm of the Commonwealth of Nations in the South Pacific, New Zealand proper comprises the large North and South Islands, and Stewart, Chatham and other minor islands. Dependencies: (i) island territories (Tokelau Islands and Cook and associated islands); (ii) Ross (antarctic) dependency; (iii) Western Samoa (trust territory). Area: New Zealand proper 103,740 sq.mi.; island territories 193 sq.mi.; Ross dependency about 175,000 sq.mi.; Western Samoa 1,131 sq.mi. Pop. (1951 census): New Zealand proper 1,939,472, including 115,676 Maoris; island territories 105 (including 15,079 in Cook Islands); Western Samoa 84,000. Pop. of New Zealand proper (1955 est.) 2,136,000; island territories (1954 est.) 22,116. Language: English; Maori (a Melanesian language). Religion: Christian (Anglican 37.5%, Presbyterian 23%, Roman Catholic 13.6%, Methodist 8%, Baptist 1.7%). Chief cities (1953 est.): Wellington (cap.) 126,000 (excluding Hutt); Auckland 131,400; Christchurch 126,600; Dunedin 71,100; Hutt 46,600. Queen, Elizabeth II; governor general in 1955, Lieut. Gen. Sir Willoughby Norrie; prime minister, Sidney George Holland.

History.—New Zealand's economy showed a high level of prosperity in 1955 although by mid-year there were signs of tendencies toward inflation. The situation had been caused largely by a high degree of private imports, with a fall in overseas exports. But agricultural production remained high and there was no unemployment and no major industrial disputes.

The minister of external affairs, T. L. Macdonald, attended the conference of the Southeast Asia Defense Treaty organization (SEATO) at Bangkok in February. He also attended the ANZUS (Australia, New Zealand and the U.S.) council in September, the United Nations meetings in October and a meeting of the Colombo plan countries in the same month. A new diplomatic post was established at Singapore when Foss Shanahan was appointed commissioner for New Zealand in southeast Asia. His appointment emphasized the change in New Zealand's main line of commitment in commonwealth defense plans. A contingent of troops was sent to assist the commonwealth strategic command in southeast Asia. The prime minister, S. G. Holland, attended a commonwealth prime ministers' conference in London in January. The deputy prime minister, K. J. Holyoake, visited Moscow at the invitation of the Soviet government in October.

Much interest was aroused by the announcement of plans for a New Zealand antarctic expedition to link up with the com-

monwealth transcontinental antarctic expedition. The New Zealand party was to be based on New Zealand territory at McMurdo Sound in the Ross Sea and would be led by Sir Edmund Hillary. New Zealand gave £50,000 to the commonwealth expedition and raised a further £100,000 by public appeal for the New Zealand expedition.

The budget, the first of the present finance minister, J. T. Watts, was introduced in July. It was a liberal budget with £9,800,000 concessions to the taxpayer and increases in social security benefits and war pensions. The biggest tax cut was a 20% rebate on income tax with an upper limit. Rates of death gift duty were liberalized and sales tax on most remaining articles taxable was removed. A special feature was restrictions on instalment purchasing in order to correct inflation tendencies. The budget figure showed estimates as follows: receipts £192,700,000, expenditure £190,300,000. A capital program of £73,900,000 was envisaged and £26,700,000 on defense. For the production year ended June 30 there was an over-all deficit of £42,300,000 in overseas exchange transactions compared with a surplus of £25,200,000 in the previous 12 months. Over the previous 16 years the national income had increased fourfold and in 1955 stood at £802,000,000, while the value of goods and services showed a similar increase.

The high degree of prosperity was marked by increased internal price stability and by a steady rise in production in primary and secondary industry. The government successfully floated a £20,000,000 loan on the London market and also converted or repaid a maturing loan of £12,000,000. In order to finance the dollar expenditure involved in the Murupara scheme \$16,000,000 were borrowed from the United States. In August measures to check inflationary tendencies were taken by the Reserve Bank. The bank rate, which stood at 4% at the beginning of the year, was raised in July to 5%, in September to 6%, and to 7% in October. The percentage of demand liabilities which trading banks had to maintain with the Reserve Bank was also increased from 15% to 16½% and measures were taken to curtail bank overdrafts. There was also a general tightening of building controls. (A. T. Cl.)

Education.—Schools, including Maori (1952): primary (including district high and intermediate schools or departments) 2,361, pupils 339,448, teachers 10,217; secondary (including secondary departments of district high and combined secondary-technical): 248, pupils 44,915, teachers 2,230; vocational 30, pupils 16,179, teachers 905; part-time vocational centres 145, students 26,349. University of New Zealand (4 constituent colleges and 2 associated agricultural colleges), 10,365 full and part-time students (4,900 full-time in 1954), teaching staff (1951) 701. Teachers in training (1953) 2,354. Correspondence schools (for those in isolated rural areas): primary 1,596, secondary 435, technical 1,420.

Finance and Banking.—Monetary unit: New Zealand pound, at par with the pound sterling and with an exchange rate of £N.Z.0.36 to U.S. \$1. Budget (consolidated fund, 1954–55 actual): revenue £N.Z.191,216,000, expenditure £N.Z.184,376,000; (1955–56 est.): revenue £N.Z.192,700,000, expenditure £N.Z.188,256,000. Social security fund (1954–55; 1955–56 est. in parentheses): revenue £N.Z.70,314,000 (£N.Z.74,100,000), expenditure £N.Z.67,163,000 (£N.Z.73,422,000). Total public debt (March 31, 1955) £N.Z.730,084,000, of which £N.Z.99,880,000 domiciled in London. Currency circulation (Aug. 1954) £N.Z.61,000,000, (April 1955) £N.Z.62,500,000. Bank deposits (Aug. 1954) £N.Z.231,400,000, (April 1955) £N.Z.250,300,000. Gold and foreign exchange (reserve bank only, Dec. 1954) U.S. \$239,000,000, (July 1955) U.S. \$258,000,000.

Foreign Trade.—(1954) Imports £N.Z.213,300,000, exports £N.Z.243,900,000. Main sources of imports: U.K. 57%; Australia 13%; other sterling area 8%; U.S. and Canada 10%; continental European Payments union countries 7%. Main destinations of exports: U.K. 67%; continental E.P.U. 16%; Australia and other sterling area 6%; U.S. and Canada 7%. Main exports: wool 36%; butter 18%; lamb 16%.

Transport and Communications.—Roads (1953): 123,800 km. Licensed motor vehicles (1953): cars 312,000, commercial vehicles 105,600. Railways (1954): 5,700 km.; freight, ton-kilometres 1,756,000,000. Shipping: merchant vessels of 100 gross tons and more (July 1954) 167; total tonnage 244,000. Air transport (1953): passenger-kilometres 228,026,000; freight, ton-kilometres 6,013,000; kilometres flown 12,161,000. Telephones (March 1954): 456,289. Licensed radio receivers (March 1955): 508,900.

Agriculture.—Main crops: (metric tons, 1954) wheat 109,000; barley 45,000; oats 27,000; (1953) potatoes 106,000; dry peas 16,000; (1952) linseed 10,000; tobacco 2,600. Livestock (Sept. 1954): cattle 5,782,000; sheep 37,275,000; pigs 656,000; horses (Jan. 1953) 158,065. Livestock products (metric tons, 1954): wool 135,000; meat 573,000 (of which beef and veal 202,000, mutton and lamb 333,000, pork 38,000); butter 188,400; cheese 106,800; milk (1952–53) 5,342,000. Wine production (1953) 2,000.

Industry.—Index of employment (1954: 1948=100) 112. Fuel and power (1954): coal 837,700; lignite 1,784,000; manufactured gas 146,800,000 cu.m.; electricity 3,745,000,000 kw.hr. Production (metric tons, 1954): cement 322,700; (1953): tungsten 25; superphosphates 691,000; wood pulp 35,000, (1954) 74,250; sawn timber (cu.m., 1953) 254,000; hardwood 96,000. New dwelling units completed (1954-55) 18,500.

Nicaragua. A Central American republic, Nicaragua is situated between Honduras on the north and Costa Rica on the south. Area: 57,143 sq.mi., of which 3,475 sq.mi. is water. Pop.: (1950 census) 1,057,023; (1954 estimate) 1,224,000. Capital: Managua, pop. (1950 census) 109,352. Other largest cities are Chinandega, 13,146; Granada, 21,035; León, 30,544; Masaya, 16,743; and Matagalpa, 10,323. Language: Spanish. Religion: predominantly Roman Catholic. President in 1955: Gen. Anastasio Somoza.

History.—Strained relations between Costa Rica and Nicaragua were spotlighted in Jan. 1955, when the Organization of American States commission investigating the unsuccessful Costa Rican revolt (see COSTA RICA) accused Nicaragua of aiding the rebels. During U.S. Vice-Pres. Richard M. Nixon's Central American tour, Pres. Anastasio Somoza complained that the report of the Organization of American States had been released without giving him an opportunity to state his position. Friction with Costa Rica reappeared in July when President Somoza charged that Col. Frank Marshall, who suppressed the January Costa Rican revolt, had plotted his murder with official Costa Rican approval.

Trouble also flared on Nicaragua's northern border where Honduras rushed troops, claiming that Nicaraguan soldiers had penetrated Honduran territory. This incident further aggravated the old dispute over the Morazán and Jerez area which was awarded Honduras in an arbitration decision made by the king of Spain in 1906. In October President Somoza proposed the unification of Honduras and Nicaragua to settle this dispute and promote Central American union. When the Nicaraguan Conservative party, indicating that it favoured strong support of the Organization of Central American States (*q.v.*), said that republican forms of government were necessary to the success of the organization, Somoza offered to resign to help achieve Central American union.

Civil liberties remained insecure in Nicaragua during 1955. The Inter-American Press association negotiated the release of the editor of *La Prensa*, Pedro Joaquín Chamorro, Jr., who had been convicted of revolutionary conspiracy in January. However, Hernán Robledo, editor of *La Flecha*, who fled to Costa Rica and later to Mexico City, could not return except to stand trial for allegedly plotting to overthrow Somoza, who later deported two staff members of *La Flecha* to Costa Rica. Moreover, the president refused the request of important members of the Conservative party that he grant general amnesty to everyone implicated in the April 1954 plot against his life. The Conservative party later joined the Liberal Independent party, a dissident branch of Somoza's party, in calling for a complete return to constitutionality, the lifting of the state of siege imposed in April 1954, and unified opposition to Somoza's reelection. Somoza's party countered by citing the unanimous approval by congress in 1954 of the constitutional amendment which permits the president to succeed himself. The state of siege was finally lifted in April 1955.

In 1955 the World bank lent Nicaragua \$7,500,000 to finance a thermoelectric power plant in Managua and \$1,500,000 for agricultural development, thus making a total of \$18,200,000 lent by the bank to that country. (See also ORGANIZATION OF AMERICAN STATES.) (R. HN.)

Education.—In 1953 there were 1,765 state elementary schools, 6 normal schools, 39 secondary schools, 6 professional schools, 1,727 mixed (urban and rural) schools, 49 other schools and 1 university (León) with a total of 4,899 teachers and 123,832 pupils.

Finance.—The monetary unit is the córdoba, valued on Aug. 31, 1955 at 14.18 cents U.S. currency, official rate, and 13.51 cents, curb rate. The official rate was changed from 20 cents to 14.18 cents effective July 1, 1955. The national budget for the fiscal year 1955-56 (July 1-June 30, 1955) placed expenditure at 240,300,000 córdobas and revenue at 238,000,000 córdobas. The public debt (Dec. 31, 1953) was 47,508,000 córdobas, of which 23,011,000 córdobas was external. Currency in circulation (July 31, 1955) totalled 120,600,000 córdobas; demand deposits, 146,700,000 córdobas. The retail price index (Managua) stood at 188 in June 1954 (1948=100).

Trade and Communications.—Exports in 1954 totalled \$62,775,000; imports, \$58,306,000. Leading exports were coffee (40%), cotton (27%), gold (13%), timber (5%) and sesame (4%); leading imports, machinery and apparatus (18%), vehicles and parts (17%), chemicals and drugs (11%) and iron and steel and manufactures (9%). Leading customers were the U.S. (45%), Germany (14%), the U.K. (12%), Japan (11%) and the Netherlands (5%); leading suppliers, the U.S. (65%), Germany (9%), the Netherlands Antilles (5%), the U.K. (3%) and Panama (3%).

In 1951 there were 268 mi. of railway and (1950) 445 mi. of surfaced highways. On Jan. 1, 1955, there were 4,078 automobiles, 2,302 trucks and 302 buses. Telephones (Jan. 1, 1954) numbered about 3,500, none of which was automatic.

Agriculture.—Production of coffee in the 1954-55 season was estimated at 326,000 bags of 132 lb. each; exports in 1954 were 285,000 bags of 480 lb. each; rice (rough), 56,200,000 lb.; tobacco (1954), 2,850,000 lb. Exports in 1954 included bananas, 576,831 stems; sesame, 14,370,000 lb.; cottonseed, 35,375 short tons; timber, 36,399,000 bd.ft. Cattle (1954) numbered 1,200,000.

Minerals.—In 1954, 233,149 troy oz. of gold were exported. (J. W. Mw.)

Nickel. World production of nickel is shown in Table I and the salient features of the industry in the United States are shown in Table II, based on reports by the U.S. bureau of mines.

Table I.—World Production of Nickel

	(In short tons)				
	1950	1951	1952	1953	1954
Canada	123,659	137,903	140,559	143,693	159,992
Cuba	8,924	13,844	14,545
Finland	94	446	418	187
New Caledonia	4,685	7,400	11,750	18,800	15,100
South Africa	929	1,254	1,444	1,891	2,112
U.S.S.R. (est.)	32,000 [†]	36,000 [†]	41,000 [†]	44,000 [†]	47,000
United States	913	756	633	602	2,645
Total	162,000	184,000	205,000	223,000	242,000

Table II.—Nickel Supply in the United States

	(In short tons)				
	1950	1951	1952	1953	1954
Production	913	756	633	602	2,645
Secondary recovery	8,795	8,602	7,749	8,352	8,701
Imports*†	96,640	101,620	118,372	131,685	144,100
Nickel content	91,281	93,116	108,850	118,737	131,787
Exports*†	3,645	4,622	6,941	15,168	14,241
Consumption	98,904	86,416	101,397	105,681	94,733

*Includes gross weight (not nickel content) of ore, matte, oxide, alloys and scrap.
†Due to changes in classification, 1952-54 data are not strictly comparable to earlier years.

United States.—Domestic production was increased to a new record in 1954 by opening the deposit at Riddle, Ore. A nickel smelting plant, completed in 1954, began commercial production in Jan. 1955.

Canada.—Output of nickel in the first eight months of 1955 totalled 118,059 short tons.

Cuba.—Several new nickel mines went into production in 1954. Expansion of capacity by 75% was begun at Nicaro in Oct. 1954.

Rhodesia and Nyasaland Federation.—In 1954, Southern Rhodesia produced 62 short tons of nickel and exported 55 tons all to western Germany. Messina Transvaal Development Corp. Ltd., was drilling a nickel deposit about 45 mi. north of Sinoia at the end of 1955. (F. E. H.; B. B. M.)

Nixon, Richard Milhous (1913-), U.S. vice-president, was born on Jan. 9, 1913, in Yorba Linda, Calif., near Los Angeles. He was educated at Whittier college, Whittier, Calif., and at Duke university, Durham, N.C., and practised law for five years at Whittier. At

VICE-PRESIDENT RICHARD M. NIXON climbing back into fishing boat after falling out during a fishing mishap in the Florida Everglades in 1955

few months in Washington, D.C., as attorney for the Office of Emergency Management (Jan.-Aug. 1942), Nixon was commissioned a lieutenant, junior grade, in the U.S. navy. He saw service in the South Pacific and by the time of his discharge in 1946 had been promoted to lieutenant commander. In Nov. 1946 he was elected to the U.S. house of representatives as a Republican from the 12th California district and was re-elected in 1948 for second term. In the house he was appointed to the un-American activities committee and figured prominently in the investigations that led to the Alger Hiss trial. In Nov. 1950 he was elected U.S. senator from California.

At the 1952 Republican convention in Chicago, Nixon was nominated vice-president on July 11 and immediately began a vigorous campaign as the running mate of Dwight D. Eisenhower, and with him won a decisive victory at the polls on Nov. 4. Nixon was sworn into office as the 36th U.S. vice-president on Jan. 20, 1953, at Washington, D.C., shortly before Eisenhower's inauguration. He became one of the administration's most active and trusted "trouble shooters," not only in domestic political matters but in foreign affairs.

In February-March 1955 Nixon made a month's good-will tour of Caribbean nations. On March 17, following publication of the Yalta documents, he said he did not believe there was any deliberate attempt to sell out to the Communists" at the 1945 conference. Nixon viewed the Geneva conference of the heads of the Big Four Powers (July 1955) as possibly the world's last chance" to attain lasting peace—a view that differed somewhat from that of Secretary of State John F. Dulles.

Nobel Prizes. The Nobel prizes for literature, physics, chemistry, medicine and peace, first awarded in 1901, were established by the Swedish industrialist Alfred Bernhard Nobel (1833-96). Each award consists of a gold medal and a sum of money which varies with the income from the \$9,000,000 fund set up by Nobel's will. In 1955 it amounted to \$36,720 for each award, which was a record high.

The peace prize for 1954 was awarded in 1955 to the Office of the United Nations High Commissioner for Refugees. Established Dec. 14, 1950, to protect racial, religious and political refugees, the office administers the UN Refugee Emergency fund which provides financial aid for the neediest of the refugees. The peace prize cash award would go directly into this fund. This prize is given to persons, organizations or institutions "who shall have most and best promoted the fraternity of nations and the abolishment or destruction of standing armies and the formation or extension of peace congresses." The committee postponed naming a winner for 1955.

Halldór Kiljan Laxness, the Icelandic novelist, was the winner of the prize in literature for his "vivid epic writing which has renewed the great Icelandic narrative art." His best-known book outside his own country was *Independent People*, which was a Book-of-the-Month club choice in the United States in Sept. 1946. Two other of his books had been translated into English, *Salka Valka* and *The Great Weaver of Kashmir*.

The 1955 prize for medicine was awarded to Axel Hugo Theorell, a Swedish biochemist, for his discoveries on the nature and action of oxidation enzymes. Theorell, who was stricken by poliomyelitis when a young man and forced to abandon his career as a medical practitioner, was head of the biochemistry department of Stockholm's Nobel Medical institute.

The chemistry prize went to Vincent du Vigneaud of Cornell Medical college at New York hospital for his work on two hormones that help in childbirth and keep a check on vital organs such as the kidneys.

Again the prize in physics was awarded jointly, this time to two Americans, Polykarp Kusch of Columbia university and Willis E. Lamb, Jr., of Stanford university, for their work in atomic measurements.

The formal presentation of the 1955 prizes was made at the traditional Nobel ceremonies in Stockholm on Dec. 10, the anniversary of Nobel's death. (See separate article on each recipient.)

(A. J. RR.)

North Atlantic Treaty Organization. The North Atlantic Treaty organization, or NATO, established in 1949, had by 1955 proved a powerful instrument for the consolidation of the free western world and for the preservation of peace and democracy. In spite of the fact that, partly as a matter of national economy and partly through the use of French NATO divisions in North Africa, the manpower commitments of various member nations were cut during the year, equipment, supplies and general military efficiency had been considerably increased. The number of airfields and the length of the fuel pipeline network had steadily grown. Design of a fighter plane for close support of NATO forces and of a common air defense system were parts of the program to develop new nonnuclear weapons on behalf of NATO.

SHAPE (Supreme Headquarters, Allied Powers in Europe) established in the Netherlands an Air Defense Technical centre in order to develop an integrated NATO system of aircraft control and early warning that could be transmitted and understood despite language barriers. Problems were created by the decision to use nuclear weapons for defense; the question arose on whose authority these weapons would be used. Pres. Dwight D. Eisen-

hower declared on Dec. 15, 1954, that he would follow the broad principle of maximum consultation with the NATO allies, and with the U.S. congress as well, consistent with the protection of the vital security interests of the United States and its allies. The use of these weapons might endanger the vital interests of other nations besides the U.S. and therefore consultation to the full extent compatible with military safety should be followed. On April 13, 1955, a draft agreement was published according to which the United States would from time to time make available to NATO atomic information deemed necessary to the development of defense plans and to the training of personnel in the use of and defense against atomic weapons.

General NATO Policy.—Returning from the NATO council meeting in Paris, U.S. Secretary of State John Foster Dulles declared on Dec. 21, 1954, that the important thing is that whatever Soviet Russia does, "we should proceed in our own way, steadily building our own strength and our own unity upon which our strength depends." The democracies should neither allow themselves to be lulled into a false sense of security by Soviet blandishments nor frightened into a state of paralysis by Soviet threats. He pointed out that violent Soviet threats directed against the west in connection with the Marshall Plan, NATO and German rearmament, and against Yugoslavia when it broke loose from Soviet control, did not result in any warlike action when they were countered by unity and determination. "If we persist in building defensive strength and unity in Western Europe it will actually promote peace." Dulles reported that for the first time NATO had the means of developing a strategy to protect western Europe from invasion. This new capability would constitute the strongest deterrent against military aggression. Should aggression, however, occur, the new strategy would make certain that western Europe would not be put into a position of having to be liberated.

As of late 1955, Dulles was proven right by the developments of the year. The Soviet Union replied to the growing strength of NATO and to the policy of strengthening the western defenses by a German contribution to the common defense with conciliatory gestures by which it apparently hoped to lull the democracies into a feeling of security. The democracies, however, proceeded with their plans for strengthening NATO and the meetings of the foreign ministers of the 15 member nations, which started in Paris on May 9, 1955, marked a turning point in NATO history.

The May 1955 Council Meeting.—For the first time not only the military plans but also the policies of NATO were discussed by all the members, whereas so far the Big Three alone had determined policy. This broadening of the scope of the council's discussions coincided with the acceptance of the German Federal Republic as the 15th NATO member. The combination of the expected 12 German divisions and of atomic weapons formed the basis of the forward strategy of western defense, though it was realized that it would take four years before the German divisions would be ready. In his speech at the opening session of the council, the German chancellor Konrad Adenauer stressed the ardent desire of the Germans for peace. "The German people have paid harshly for the horrors which were committed in their name by blind and evil leadership. . . . I see in the accession of the German Federal Republic to NATO . . . the expression of the need to overcome the narrow-minded nationalism which, in past decades, was the root of our disaster. . . . Within the community of free nations Germany will be an able and reliable partner and in this community we wish to employ all our efforts for the safeguarding of freedom and human dignity."

The North Atlantic council also welcomed the initiative of the Big Three—the United States, Britain and France—in pro-

posing to the Soviet Union negotiations to find means for resolving outstanding issues, especially the peaceful unification of Germany in freedom and steps toward the reduction, under effective safeguards, of armed forces. For the first time the Atlantic council also reviewed in common the situation in the middle east and in the far east. The Turkish foreign minister reported on the Bandung conference of Asian and African peoples. The Atlantic council welcomed the conclusion of the Turkish-Iraqi pact and of the Manila pact and expressed the hope that there would be no further resort to force in the far east, since this would so clearly endanger world peace. The thorough exchange of political views among the member nations, the council declared, "constitutes a most significant proof of the solidarity of the alliance." The member nations were resolved to continue these procedures in order to develop their policies on the basis of common principles.

Deterioration in the NATO Situation.—In spite of the growing military strength of NATO, there were in the fall of 1955 certain signs of rifts in the cohesive structure of NATO. German nationalist agitation against the Europeanization of the territory of the Saar, as demanded by France and agreed by Chancellor Adenauer, threatened to drive a wedge between the two nations, which were separated by bitter memories of the past and had only slowly begun to tread the paths to conciliation. A similar situation developed on the southeastern flank of NATO. There the age-old hostility between Turkey and Greece had been slowly overcome by wise and moderate statesmanship until nationalist passions flared up again as a result of the triangular dispute over Cyprus between Greece, Turkey and Britain. These three nations played a leading part among the six nations—United States, Britain, France, Italy, Greece and Turkey—which had co-operated to make the Mediterranean safe and free through the NATO southern command. This command established in June 1951, with its headquarters in Naples, Italy, succeeded under U.S. Adm. William M. Fechteler in fusing the forces of the six nations into an integrated whole. However, the neutralization of Austria and the neutralist trends in Yugoslavia complicated the defense of southeastern Europe, which seemed secured in 1954 by the defensive military alliance closely linking Yugoslavia, Turkey and Greece. At a meeting of the defense ministers of the NATO nations in Paris on Oct. 10, 1955, the supreme Atlantic naval commander, Adm. Jerauld Wright stressed that the Soviet Union had more submarines than all other nations combined and that it hoped thereby to drive a "iron wedge" between North America and western Europe. The conviction that Soviet policy was now fundamentally directed toward weakening the unity of NATO was responsible for the growing number of western proposals for broadening the scope of NATO beyond the purely military alliance and thus ensuring the growing solidarity of the peoples of the North Atlantic area.

The Atlantic Community.—In order to make the Atlantic Community "a lasting reality," to use the words concluding the report of the NATO council of April 1953, and to anchor it in the public opinion of the member nations, a conference of parliamentarians from the various NATO countries met in Paris in July 1955 and decided to establish a continuing and permanent association. Premier Mario Scelba of Italy urged in Washington, D.C., on March 29, 1955, that NATO should be developed from a purely military union into an organization for concerted economic, social and political action. "Military defense, while fundamental, is not sufficient alone," he declared. The NATO nations wished to defend not only their existence but a common heritage of liberty under law. To appeal to the western people and to strengthen them in their resistance to totalitarianism they must be reminded, as NATO's Secretary-General Lord Ismay said, that NATO "is something new and exciting and

revolutionary, the most challenging and constructive experiment in international relations ever attempted." The point of view of a growing number of public figures on both sides of the North Atlantic about the need for a strengthening and vitalization of NATO was expressed by the Belgian foreign minister Paul-Henri Spaak when he wrote in the quarterly *Foreign Affairs*: "Let us end our timid efforts, which at best show vague good will more than a clear awareness of realities, and let us accept the consequences of the plain fact that the fate of all of us in the West is inextricably linked. The West is condemned not only to wage war together but to create policy together. Let us continue the military efforts we have begun, but let us urgently set to work to improve our political relations, showing in this field also a sense and purpose of real solidarity." (See also *ARMIES OF THE WORLD*; *EUROPEAN UNITY*; *FOREIGN AID PROGRAMS, U.S.*)

North Borneo: see BRITISH BORNEO.

North Carolina. A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union. Area: 52,712 sq.mi. (49,097 sq.mi. land, 3,615 sq.mi. water). Pop.: (est. July 1, 1955) 4,190,000; (1950 census) 4,061,929, of which 1,368,101 (33.7%) were urban, 2,693,828 (66.3%) rural and 1,096,720 (27%) nonwhite. Capital: Raleigh, pop. (1950) 65,679; other cities: Charlotte 134,042; Winston-Salem 87,811; Greensboro 74,389; Durham 71,311; Asheville 53,000.

History.—The North Carolina legislature of 1955, the longest in the state's history, was faced by difficult problems of (1) growing state needs (especially in education) and limited tax revenue and (2) the necessity of adjusting to the supreme court's decision outlawing segregation in the public schools. The legislature authorized minor tax increases to raise sufficient revenue to meet necessary expenditures, but it authorized only slight increases in expenditures for state services. The legislature completely revised the state's public school law and made the following major changes: (1) elimination from the law of any reference to race; (2) transfer of authority over enrolment and assignment of pupils from the state board of education to local boards of education; (3) transfer of ownership and operation of the state's school buses to local administrative units; and (4) substitution of yearly contracts for teachers and principals in lieu of continuing contracts. The legislature also established a nine-member state board of higher education to co-ordinate the operation of the state-supported institutions of higher education so as to avoid duplication and overlapping of educational effort.

Gov. Luther H. Hodges appealed to Negroes and whites to continue attending separate schools on a purely voluntary basis. It appeared that the majority of both races approved the governor's advice, for as schools opened in Sept. 1955 there was no integration of the races in the public schools. In September a federal district court invalidated a ruling of the board of trustees of the University of North Carolina preventing the admission of Negroes and three Negroes were admitted to the undergraduate school of the University of North Carolina.

North Carolina suffered heavy loss of life and property from a series of hurricanes that hit the state in 1954 and 1955. In Oct. 1954, hurricane "Hazel" swept through North Carolina, causing the loss of 19 lives, destroying hundreds of buildings at the beach resorts, and inflicting total property losses of \$120,-

000,000. In Aug. and Sept. 1955 hurricanes "Connie," "Diane," and "Ione" hit the coastal areas of the state in quick succession causing the loss of 5 lives and destroying property estimated at \$150,000,000.

The principal state officers in 1955 were Luther H. Hodges, governor (succeeded Gov. William B. Umstead, who died Nov. 7, 1954); Thad Eure, secretary of state; Henry L. Bridges, auditor; Edwin Gill, treasurer; Charles F. Carroll, superintendent of public instruction; William B. Rodman, attorney general; M. V. Barnhill, chief justice; L. Y. Ballentine, commissioner of agriculture; Frank Crane, commissioner of labor; Charles F. Gold, commissioner of insurance.

Education.—In 1953-54 there were 2,241 public elementary schools, with 22,970 teachers, 981 principals and supervisors, and 761,599 enrolled pupils and 937 high schools with 8,081 teachers, 883 principals and supervisors, and 206,467 enrolled pupils. These schools were operated at a cost of approximately \$151,000,000 including about \$10,000,000 of federal funds, \$121,000,000 of state funds, and \$20,000,000 of local funds. The average daily attendance in the public schools was 874,165; the number of inhabitants of school age (6-20) was about 1,200,000. The average salary for elementary school teachers was \$3,200 and for high school teachers \$3,250.

Social Insurance and Assistance, Public Welfare and Related Programs.—In June 1955, public grants amounting to \$1,614,028 were made to 51,780 persons for old-age assistance; \$1,214,685 to 19,756 families for aid to dependent children; \$417,019 to 11,321 persons for aid to the permanently and totally disabled; \$199,368 to 4,897 blind persons; and \$41,054 to 4,689 persons for general relief. For hospitalization of assistance recipients and other indigent persons the total amount expended for June was \$352,470. During the year ending June 1955, the total amount of public relief funds distributed was \$43,235,227, and unemployment benefits amounted to \$30,476,431.

In 1955 the state maintained 12 charitable institutions with 13,875 inmates (on June 30); 5 correctional institutions; and the state prison system with 10,079 prisoners on July 1, 1955.

Communications.—In 1955 the state highway and public works commission maintained 10,883 mi. of state highways, of which 10,746 were hard-surfaced; 55,740 mi. of secondary or county roads, of which 21,633 mi. were hard-surfaced; and 2,493 mi. of city streets, of which 2,170 mi. were hard-surfaced, making a total mileage maintained of 69,116. There were 4,700 mi. of railroads, 870 mi. of city bus routes and 11,912 mi. of passenger bus routes in 1955. There were 140 airports and 6 commercial airlines serving the state. There were 759,986 telephones in use in the state on June 30, 1955.

Banking and Finance.—On June 30, 1955, there were 95 national banks and branches with assets of \$622,072,000 and 438 state banks and branches with deposits of \$1,566,071,872 and assets of \$1,747,832,512. On Jan. 1, 1955, there were 146 building and loan associations operating under state charters with 267,732 members and total assets of \$387,050,993 and 32 federal savings and loan associations with total assets of \$242,659,946. In 1954-55 state receipts were \$868,233,889.19; disbursements \$897,444,350.45. On June 30, 1955, the state gross bonded debt was \$291,768,000, less bonds invested in sinking funds, \$60,531,840.85; net bonded debt \$231,236,159.15. Only \$68,410,000 was general fund

Table I.—Principal Crops of North Carolina

Crop	Indicated 1955	1954	Average 1944-54
Tobacco, lb.	1,043,435	913,874,000	855,264,000
Cotton, bales.	320,000	364,000	492,000
Corn, bu.	63,643,000	50,784,000	62,641,000
All hay, tons	1,253,000	1,081,000	1,266,000
Peasants, lb.	268,450,000	251,980,000	297,142,000
Wheat, bu.	6,966,000	7,436,000	7,178,000

WHALE CARCASS washed up on the North Carolina shore near Kitty Hawk in Feb. 1955

debt; the remaining debt was highway fund debt secured by proceeds from a tax on gasoline sales. The assessed value of property was \$5,943,198,630 on June 30, 1954. In the state and general fund there was a cash balance of approximately \$14,990,937 at the end of the 1955 fiscal year.

Agriculture.—The cash income of North Carolina farmers in 1954 was \$710,051,000 from crops; \$216,440,000 from livestock and livestock products; and \$6,107,000 from government payments. Total acreage harvested was 6,490,000. The average per farm value of the lands and buildings on the 286,900 farms in 1954 was \$8,580 with the average value per acre being about \$121.

The eastern agricultural area suffered heavily from severe hurricanes in the fall of 1954 and the summer of 1955. In response to a request from the governor, 28 counties were declared disaster areas making them eligible for federal emergency crop loans.

Manufacturing.—North Carolina leads the southeast in industrial production and is the nation's largest producer of textile and tobacco products. In recent years chemical, paper manufacturing and electrical machinery have experienced notable growth. In 1954 industrial establishments numbering 7,500 employed 441,000 wage earners at wages of approximately \$1,000,000,000. Estimated industrial production in 1954 was \$6,121,000,000 and electric power production was 14,737,000,000 kw.hr. (Jo. C. S.)

Table III.—Mineral Production of North Carolina
(Short tons, except as noted)

Mineral	1952		1953	
	Quantity	Value	Quantity	Value
Clays	1,358,000	\$ 2,080,000	1,466,000	\$2,535,000

Other minerals	5,883,000	...	9,889,000
Total		\$34,726,000		\$38,446,000

*Value included with other minerals.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in North Carolina in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953, North Carolina was far in the lead among the states in output of feldspar, was first in mica, second in asbestos, third in talc, and fourth in vermiculite. The state ranked 35th in the value of its mineral output, with 0.27% of the U.S. total.

North Dakota. A west north central state of the United States. North Dakota was admitted to the union Nov. 2, 1889; popular name, "Flickertail state." Area: 70,665 sq.mi., including 608 sq.mi. of water. Pop.: (1950) 619,636; (July 1, 1955 est.) 641,000. Urban pop. (1950) 26.6%. Capital (1950 pop., with 1955 est. in parentheses), Bismarck, 18,640 (23,300); chief cities: Fargo, 38,256 (43,700); Grand Forks, 26,836 (30,500); Minot, 22,032.

History.—State officers in 1955 were: governor, Norman Brunsdale; lieutenant governor, C. P. Dahl; secretary of state, Ben Meier; auditor, Berta E. Baker; treasurer, Albert Jacobson; attorney general, Leslie R. Burgum; commissioner of insurance, A. J. Jensen; commissioner of agriculture and labour, Math Dahl; superintendent of public instruction, M. F. Peterson; tax commissioner, J. Arthur Engen; public service commissioners, Martin Vaaler, Ernest D. Nelson and Anson J. Anderson.

The 34th legislative assembly (Jan. 4–March 4, 1955) enacted 355 bills. It raised the gasoline tax one cent and the auto registration fees 5% and 10% to provide more funds for highways, fixed the daylight speed limit at 65 m.p.h., added nine men to the state highway patrol, established a five-man state board of education, appropriated \$75,500,000, authorized a Garrison diversion conservancy district of 22 counties to plan irrigation, raised the minimum old-age assistance payment to \$60 a month less income, permitted the sale of liquor to Indians and provided that auto licence plates bear the slogan "Peace Garden State."

The embankment of Garrison dam was completed in the fall of 1955 and the generation of electric power was to start in Jan. 1956. It was expected that by June 30, 1956, the Garrison project would be approximately 90% completed. The \$4,200,000 Four Bears bridge, reaching 4,480 ft. across the reservoir at New Town, was opened in Oct. 1955. To June 30, 1956, \$251,780,700 had been appropriated for the Garrison project, including \$20,100,000 for fiscal 1956.

Education.—Public school teaching positions for the year ending June 30, 1954, were 6,815; public school enrolment 121,542 (elementary 92,880; high school 28,662); schools in session 3,051; average salary of teachers including city superintendents \$2,770; average cost per pupil enrolled \$269; total expenditures for public elementary and high schools \$31,820,058. The legislature appropriated \$11,809,252 for nine institutions of higher learning for the 1955–57 biennium. Enrolment in 12 institutions of higher learning with 642 in the faculties totalled 9,615 full-time and 656 part-time students in Oct. 1955.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ending June 30, 1955, public assistance totalled \$9,783,065 (federal 44.9%, state 39.0%, county 16.1%). Old-age assistance cost \$6,754,145 (8,252 cases); aid to dependent children \$2,269,788 (4,644 children); aid to the blind \$76,928 (118 persons); aid to the permanently and totally disabled \$722,073 (880 persons); general assistance \$543,871 (764 cases); administrative expense \$936,933. Total expenditures for three charitable and three correctional institutions for fiscal 1955 amounted to \$5,988,134. Number of inmates in Sept. 1955: feeble-minded 1,150; insane 2,157; tubercular 107; penitentiary 202; training school 323; state farm 8.

Communications.—As of Dec. 31, 1954, the highway mileage was: state highways 6,605 mi., local roads 70,375 mi., prairie trails 39,501 mi. State and federal funds expended in 1954 on the state highway system were: for construction \$10,812,624; for maintenance \$4,026,705; for administration \$504,241. Appropriated to counties in 1954: from motor fuel taxes \$1,540,708; from motor vehicle registration fees \$3,213,164; from self-imposed property taxes \$4,435,161. Motor vehicle registration in 1955 to Aug. 31: passenger cars 199,761; trucks 93,397. Six railroads operated 5,259 mi. of track.

Banking and Finance.—On June 30, 1955, the Bank of North Dakota and 115 other state banks had resources of \$364,281,594 and deposits of \$333,717,221. Resources of 38 national banks were \$279,365,100 and deposits were \$256,823,700. State treasury collections for the year ending June 30, 1955, were \$60,162,233; disbursements were \$60,108,524. Total bonded indebtedness was \$20,201,250.

Table I.—Leading Agricultural Products of North Dakota

Crop	Estimated 1955		Average, 1944–53
	1955	1954	
Wheat, bu.	109,866,000	69,896,000	131,707,000
Corn, bu.	29,182,000	25,704,000	25,530,000
Oats, bu.	59,370,000	49,464,000	60,603,000
Barley, bu.	78,039,000	67,568,000	47,264,000
Rye, bu.	7,950,000	4,466,000	2,710,000
Flaxseed, bu.	25,992,000	24,624,000	13,050,000
Potatoes, bu.	14,700,000	20,600,000	19,058,000
Hay, tons	3,900,000	3,675,000	3,183,000
Sugar beets, tons	391,000	418,000	223,000
Soybeans for beans, bu.	1,146,000	1,100,000	201,000

Agriculture.—In 1954 cash farm income totalled \$471,233,000 (65.8% from crops, 32.9% from livestock, 1.3% from government payments), down 1.5% from 1953 and 13% from 1952. Income from livestock was up 6.4% over 1953; wheat accounted for 36% of income in 1954, 41% in 1953.

Table II.—Mineral Production of North Dakota
(Short tons)

Mineral	1952		1953	
	Quantity	Value	Quantity	Value
Coal	2,984,000	\$ 7,068,000	2,803,000	\$ 6,618,000
Sand and gravel	6,557,000	1,841,000	6,174,000	2,165,000
Stone	67,000	5,000	35,000	3,000
Other minerals	3,143,000	...	10,451,000
Total		\$12,057,000		\$19,237,000

in 1953. On Sept. 15, 1955, the all-commodity index of prices received by farmers stood at 224% (1909–14 base period), compared with 242% a year earlier.

In 1954 there were 61,939 farms in North Dakota (65,401 in 1950); average size 674 ac. (630 ac. in 1950). On Jan. 1, 1954, 28,358 farms had telephones, 55,815 electricity, 11,178 television, 25,400 piped running water, 25,195 home freezers.

In the summer of 1955 high temperatures and adequate moisture pushed wheat along so rapidly that it escaped serious damage from rust,

but temperatures were too high for the best development of small grains.

Employment and Business Activity.—Nonagricultural employment in 1955 (January–August) averaged 113,050, or 0.3% above 1954, but a general decline in employment that set in in May made it doubtful if employment for the full year was as great as in 1954. To some extent declines in employment in construction, trade, transportation and utilities were offset by increases in mining, manufacturing, finance, service and government. In 1955 (January–August) manufacturing workers earned \$69.04 a week (\$66.94 in 1954); on July 1 farm labourers averaged \$147 a month with room and board. (E. R. N.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in North Dakota in 1952 and 1953 (preliminary) whose value exceeded \$100,000. North Dakota ranked 41st among the states in the value of its mineral output in 1953, with 0.13% of the U.S. total.

Northern Ireland: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

Northern Rhodesia: see RHODESIA AND NYASALAND, FEDERATION OF.

Northwest Territories. The Northwest Territories comprise all that part of Canada north of the 60th parallel of north latitude, except the portions thereof within the Yukon Territory and the provinces of Quebec and Newfoundland; it also includes the islands in Hudson bay, James bay and Ungava bay, except those within the provinces of Manitoba, Ontario and Quebec. Area: 1,304,903 sq.mi., of which 51,465 sq.mi. is water; pop. (1951 census) 16,004, including 5,344 whites, 3,803 Indians and 6,857 Eskimos.

For purposes of organization and administration, the territories were divided by order in council dated March 16, 1918, into the districts of Mackenzie (527,490 sq.mi.), Keewatin (228,160 sq.mi.) and Franklin (549,253 sq.mi.). The Northwest Territories act, 1952, as amended, provides for the government of the territories by a commissioner under instruction given from time to time by the governor in council or the minister of northern affairs and national resources. Legislative powers are in the hands of a council of nine members, of whom five are appointed and four elected from four constituencies of the Mackenzie district.

During 1955 the commissioner of the Northwest Territories was R. G. Robertson, deputy minister of northern affairs and national resources. Appointed members were: F. J. G. Cunningham, deputy commissioner; L. C. Audette; L. H. Nicholson; C. M. Drury; and Jean Boucher. Elected members were: John Parker; Frank Carmichael; Robert Porritt; and J. W. Goodall.

Education.—In 1955 the department of northern affairs and national resources operated federal schools at Fort Smith, Hay River, Fort Liard, Fort Rae, Fort McPherson, Rocher River, Fort Good Hope, Fort Norman, Fort Franklin, Arctic Red River, Marie River, Lac la Martre, Aklavik, Coppermine, Tuktoyaktuk, Chesterfield Inlet, Cape Dorset on Baffin Island, Coral Harbour on Southampton Island, and also at Fort Chimo and Port Harrison in the province of Quebec. A number of these schools were for Eskimos. A school was operated by the Discovery Yellowknife mines, 60 mi. N. of Yellowknife, and one was also operated by the Eldorado Mining and Refining Ltd. at Port Radium. Schools were operated at a number of the settlements by missions of the various churches with financial assistance from the federal government. Yellowknife had the only organized school districts, where a 12-room public and high school and a 4-room separate school were in operation. Correspondence courses were available, free of charge, to any child whose parents requested them or to any adult who wished to enrol. A vocational training program suitable for natives of the Northwest Territories and a special curriculum for use in Eskimo schools were being developed.

Public Health and Welfare Services.—Schools in most of the settlements are staffed by teachers who assist with welfare needs and organize community recreational programs in addition to their work in the classrooms.

During 1955 11 hospitals were operated in the Northwest Territories, 8 by missions, 1 by a locally elected hospital board at Yellowknife and 2 by private companies. Seven health centres were in operation. All hospitals and health centres received grants from the government of Canada.

Under the National Health Grants program, an eyesight survey was underway in the Mackenzie district, while chest X-rays were carried out during the summer months in conjunction with the department of national health and welfare. Cancer diagnosis, tuberculosis treatment, dental services for children in Yellowknife, Fort Smith and Hay River, and treatment of crippled children was provided without charge.

During 1955 a total of 91 persons received old-age assistance and 18 persons received blind persons' allowance. The territorial council and the government of Canada shared cost of providing allowances up to \$40 a month to residents permanently and totally disabled.

A physician and dentist accompany the annual eastern arctic patrol,

treating persons at points of call and visiting many settlements to make physical examinations and X-ray surveys and to administer preventive inoculations.

Transportation and Communications.—A direct inland water transportation route for a distance of about 1,700 mi. is provided by the Athabasca, Slave and Mackenzie river systems. Subsidiary routes on Lake Athabasca, Great Slave lake and Great Bear river and lake total more than 800 mi. The Mackenzie highway, connecting Grimshaw, Alta., with Hay River on Great Slave lake, continued to provide service during 1955. Scheduled air mail, passenger and express services were operated throughout the year to most of the settlements in the Mackenzie district.

Radio communications between nearly all settlements and trading posts in the territories and outside points were maintained through government and private radio stations.

Eastern Arctic Patrol.—The 1955 annual eastern arctic patrol was carried out by the government ship "C. D. Howe." This ship carried supplies and replacement staff to eastern arctic settlements, including Royal Canadian Mounted Police detachments, schools, hospitals and nursing stations, trading posts and missions. On board were administrative officers of the department of northern affairs and national resources and medical and dental officers of the department of national health and welfare who dealt with cases requiring attention at the places visited.

Agriculture and Fisheries.—Limited farming and horticultural activity is encouraged and assisted by the department of agriculture, which maintains an experimental substation at Fort Simpson. A limited experiment was being carried out with Eskimos at Fort Chimo to determine the feasibility of growing field and garden crops and raising livestock and poultry.

During the summer season of 1954 and the winter season of 1954–55, commercial fishing on Great Slave lake and other waters in that vicinity produced a total catch of 6,700,146 lb., with a market value of \$2,000,000. Whitefish, lake trout and inconnu were the principal species taken.

Hunting and Trapping.—Fur production in the territories during the year ended June 30, 1954, was valued at \$758,512, with a total of 418,867 pelts taken during that period. Fur production the previous year was valued at \$877,345, and 388,653 pelts were taken. A large part of the catch was muskrats. Further decline in the prices of most species and decreased production resulted in less income for the trappers. Trapping remains the principal occupation of the native population and is carried out under the Northwest Territories Game ordinance.

The herds of caribou continued to be one of the chief food resources for the Indians and Eskimos, and every effort was being made to preserve this resource for the natives.

Five semidomesticated reindeer herds were maintained by the federal government in the Mackenzie delta region for the benefit of the native population; three of the herds were under Eskimo management and one was privately owned. At the reindeer roundups in 1954 there were about 7,738 animals in the five herds. Large buffalo herds were also maintained in Wood Buffalo National park. A limited slaughter of reindeer and buffalo for meat production is carried out annually.

Mineral Production.—Mineral production in the Northwest Territories during 1954 was valued at \$10,548,781, of which gold accounted for \$10,193,131 and silver \$47,880. Crude oil is produced and refined at Norman Wells on the Mackenzie river, with 1954 production totalling 297,270 bbl. After being processed at the local refinery, the oil was shipped to various points on the Mackenzie river. (R. G. R.)

A democratic monarchy of northern Europe, Norway is bounded north by the Arctic ocean, east by Finland, the U.S.S.R. and Sweden, south and west by the North sea. Area 149,284 sq.mi. Pop.: (1950 census) 3,278,546; (1954 est.) 3,408,000. Capital: Oslo (1950 census) 434,047; (1954 est.) 450,000. Other principal cities (1950 census): Bergen 112,845; Trondheim 56,669; Stavanger 50,647. Religion: Lutheran Christian. Ruler in 1955: King Haakon VII. Prime ministers: Oscar Torp; after Jan. 22, 1955, Einar Gerhardsen.

Spitsbergen (official name, Svalbard), Norwegian since 1925, is an archipelago lying about midway between northern Norway and the north pole. Area: 23,957 sq.mi. Pop. (1950): about 1,000 Norwegians and an estimated 2,600 Russians.

History.—In connection with the joyful recognition of the tenth anniversary of liberation, May 7–9, 1955, a Norwegian gift of kr. 4,000,000 was presented to Sweden. The gift would be spent for the establishment of a centre for Swedish students and culture in Oslo, where a similar Danish centre had been established shortly after World War II.

The Labour party was firmly entrenched in power, and no fundamental shift in policy was involved when Oscar Torp resigned after three years and his predecessor, Einar Gerhardsen, resumed the position (Jan. 22, 1955). About half the cabinet was new, the rest holdovers, including the foreign minister, Halvard Lange. Torp was elected president of the *storting*, the position vacated by Gerhardsen, and from which Torp had come to the premiership.

The problems of the new government remained primarily economic. Norway, like Denmark, was importing more than it exported, and large sums were being invested in enterprises for future production. In April a loan of \$15,000,000 was negotiated in the United States, and one of \$25,000,000 from the World bank (International Bank for Reconstruction and Development). One heavy postwar investment, the government steel plant at Mo i Rana, began production in April, and was expected to turn out 170,000 tons of rolled steel per year. The hydroelectric power plant for the works lay deep in a mountain, under several hundred feet of rock, with miles of tunnels to carry water to the turbines. The reconstruction of north Norway was almost complete, and the total investment for homes made it possible for one-fifth of all Norwegians to live in houses built since 1945.

Ship tonnage was being steadily increased; at the end of 1954 Norway had a merchant fleet of 6,900,000 tons, about half of it in tankers. For Norwegian account the 34,500 ton "Jara-gua" was launched at Göteborg, Swed., in May; this would be the largest vessel in Scandinavia. Princess Astrid christened the 18,000 ton "Bergensfjord" being built at Newcastle, Eng., for the Norwegian America line. But the outlay for these achievements was great, and the government felt it necessary to impose curbs on both investment and spending. New taxes were levied and the interest rate was increased from 2½% to 3½%. The government also passed new land use laws in an attempt to increase the size and efficiency of farms. Farms could no longer be divided without permission from a provincial commission; the established alodial system was modified and the state assumed the right to expropriate and purchase lands to be sold to farmers who needed more acreage.

Total fish production continued to be good, but the spring fishing at Lofoten was again disappointing. Whaling continued important, and progress was made in popularizing whalemeat not only for mink farms but for human consumption, notably in New York.

King Haakon fell and broke his thigh, but made good recovery; he celebrated his 83rd birthday on Aug. 3 and the fiftieth anniversary of his rule in November. This also marked 50 years of Norway's independence. In Bergen the famous Hansa quay was swept by fire in July, and almost half destroyed. A new main base for the Norwegian navy was begun at Haakonsvern, near Bergen; partner nations in NATO were to contribute the major portion of the costs.

(F. D. S.)

Education.—Schools (1951-52): primary 5,505, pupils 337,420, teachers 12,159; secondary 281, pupils 38,319, teachers 2,482; folk high and continuation schools 560, pupils 21,619; vocational (1952-53) 477, pupils 38,649. Teachers' training schools (excluding state teachers' training college) 17, students 2,746. Institutions of higher education (1952-53) 10, including 2 universities; university students 3,656.

Finance and Bankings.—Monetary unit: krone (pl. kroner), with an exchange rate of kr. 7.143 to the U.S. dollar. Budget: (1955-56 est): revenue kr. 4,454,000,000; expenditure kr. 3,901,000,000; (1954-55) revenue kr. 4,129,000,000, expenditure kr. 3,903,000,000. Internal debt (1953): kr. 4,233,600,000, external debt kr. 1,221,700,000. Currency circulation: (Mar. 1955) kr. 3,029,000,000; (July 1954) kr. 3,027,000,000. Deposit money: (Mar. 1955) kr. 6,333,000,000; (July 1954) kr. 6,483,000,000. Gold and foreign exchange (Central bank only, May 1955; Dec. 1954 in parentheses): U.S. \$134,100,000 (\$137,700,000).

Foreign Trade.—(1954) Imports kr. 7,277,000,000; exports kr. 4,163,000,000. Main sources of imports: U.K. 20%; Sweden 16%; Germany 15%; other continental European Payments union countries 20%; U.S. and Canada 12%. Main destinations of exports: U.K. 19%; Sweden 10%; Germany 10%; other continental European Payments union countries 23%; U.S. and Canada 9%. Main exports: fish 18%; wood pulp 14%; paper 13%.

Transport and Communications.—Roads (June 1953): 46,270 km. Motor vehicles in use (1954): cars 90,456, commercial vehicles 70,713. State railways (1954) 4,492 km.; passenger-km. (June 1952-53) 1,508,000,000; freight, ton-km. (1954) 1,434,000,000. Shipping, merchant vessels of 100 gross tons and over (July 1954): 2,288; total tonnage 6,806,004; gross freight earnings (1953) kr. 3,650,000,000. Air transport (1954): passenger-km. 264,515,000; freight, ton-km. 7,976,000. Telephones (June 1953) 530,827. Radio receiving sets (1953): 895,000.

Agriculture and Fisheries.—Main crops (metric tons, 1954): wheat 41,000; barley 233,000; oats 159,000; rye 2,000; potatoes 1,130,000. Livestock (Sept. 1954): cattle 1,181,000; sheep 1,957,000; horses 159,000; chickens 5,284,000; (June 1953) pigs 379,000; goats 119,000. Food production (metric tons, 1954): milk, delivered 1,052,600; butter 10,400; cheese 29,800; meat (1953): beef and veal 43,000; mutton and lamb 17,000; pork 40,000. Fisheries (metric tons 1953): total catch 1,505,500; whale oil production (antarctic only, 1953-54) 174,200; value (1954) kr. 297,000,000.

Industry.—Fuel and power (1954): coal 338,400 metric tons; manufactured gas 48,560,000 cu.m.; electricity 21,370,000,000 kw.hr. Timber production (cubic metres, 1953): sawn softwood 1,714,000; sawn hardwood 25,000. Raw materials (metric tons, 1954): iron ore (metal content 65%) 1,209,600; pig iron 232,600; crude steel 120,700; copper, smelter 12,900; zinc, smelter 43,300; aluminum, smelter 65,000; pyrites (1953) 739,000; nitrogenous fertilizers, N content (1953-54) 245,600. Manufactured goods (metric tons, 1953): wood pulp, mechanical 527,000; chemical 544,000; newsprint 162,000; other paper 300,000; cement (1954) 783,800. Index of industrial production (Jan. 1955; 1948=100): mining 166, manufacturing 147, export (Feb. 1955) 248. Unemployed (1954) 1.3%.

Nose and Throat, Diseases of: see EAR, NOSE AND THROAT, DISEASES OF.

Nova Scotia. Second smallest of the Atlantic provinces of Canada, Nova Scotia entered the confederation in 1867. Area: 21,068 sq.mi. Pop: (1951) 642,584; (June 1, 1955, official est.) 683,000. Capital: Halifax, pop. (1951) 85,589; other large centres (pop. 1951): Sydney 31,317, Glace Bay 25,586, Dartmouth 15,037, Truro 10,756, New Waterford 10,423.

History.—During 1954 there was a continued slump in the coal industry, but the general level of production throughout the economy of the province remained high. The \$23,000,000 Canso causeway and the \$10,500,000 Halifax-Dartmouth suspension bridge were completed and opened in 1955, the former in August and the latter in April, alleviating two serious travel bottlenecks. The Liberal government of Premier Henry D. Hicks continued its policy of a systematic drive to establish new industries.

Education.—Latest available statistics for provincially controlled schools were for the calendar year 1953 when \$17,677,435 was expended on education. Total public-school enrolment for the school year 1953-54 was 141,454, with 5,096 teachers engaged and an average daily attendance of 125,470.

Public Health and Welfare.—On March 31, 1954, there were 3,206 patients registered in 68 public hospitals. For the year ending March 31, 1953, the federal government made family allowance payments of \$16,297,170 on behalf of 227,298 Nova Scotian children, old-age security pensions of \$17,259,287 to 36,150 pensioners, old-age assistance payments of \$893,059 to 4,789 recipients and pensions of \$253,718 to 722 blind. For the same period, provincial mothers' allowances of \$1,405,765 were paid to 2,405 mothers.

Transportation and Communications.—In 1953 there were 88,985 passenger automobiles registered. On March 31, 1954, 1,544 of the 15,111 mi. of highways had been paved. By March 31, 1953, there were nine airports, an increase of one over the previous year. In 1951 there were 116,041 telephones in use. On March 31, 1953, there were 104,167 radio receiving sets in the province.

Banking and Finance.—At March 31, 1954, the net direct provincial debt, less sinking funds, totalled \$120,598,095, while the net direct debt, less sinking funds, was \$4,254,384. At Sept. 30, 1953, there were 221 credit unions, and they lent \$5,426,342 for the fiscal year ending at that date. On Jan. 1, 1953, there were 148 branches of chartered banks throughout the province.

Agriculture.—Farm cash income for 1953 was \$40,566,000, the second highest year on record. Field crop production yielded \$16,830,000. Chief sources of cash income were: potatoes \$791,000; fruits \$1,525,000; vegetables \$927,000; forest products \$7,289,000; cattle and calves \$5,525,000; hogs \$2,829,000; dairy products \$11,649,000; poultry \$3,937,000; eggs \$4,644,000. On June 1, 1953, there were an estimated 202,000 cattle, 95,000 sheep and 39,000 swine on farms.

Fisheries, Furs and Forestry.—The landed value of fish for 1953 was \$21,410,000. Forestry production value was \$58,048,000. Both were increases over the previous year. Fish landings for 1953 totalled 365,500,000 lb. At Dec. 31, 1953, the value of fur-bearing animals in captivity was estimated at \$129,603. Beaver, the only fur-bearing animal for which trapping was reported, netted \$29,390 in 1953. Lumber production for 1953 was 234,058,000 bd.ft. The value of wood products manufactured was \$36,545,000 in 1953, while the value of paper products was \$21,503,000.

Manufacturing.—No accurate production statistics or estimates were available before 1951 when 30,512 employees in 1,474 establishments earned \$63,975,745 by converting \$172,115,336 worth of raw materials into products with a gross value of \$303,619,234. The relative positions of the chief industries were available only to 1950, when the largest (with employees in parentheses) in terms of value of products was fish

processing, \$36,357,774 (3.805); in second position, primary iron and steel, \$36,326,915 (4.535); third, sawmills, \$15,772,588 (3.111). In 1950 total value of all industrial products stood at \$255,887,499.

Mining.—Preliminary figures set mineral production value at \$63,541,471, but fully revised statistics were for 1951, when the production value was \$59,727,256. In 1951 the three leading minerals in terms of value were: coal \$49,113,932; gypsum \$4,107,822; salt, \$1,631,904. In 1951, 13,799 employees, working in 615 mines or plants, earned \$37,388,122 in wages and used fuels and processing supplies worth \$10,963,266, to make shipments with a net value of \$49,170,075. Nuclear Studies: see PHYSICS.

Nursing. The American Nurses' Foundation, Inc., was established by the American Nurses' association in Jan. 1955 to conduct studies, surveys and research in the field of nursing, provide scholarships and fellowships and make grants to public and private nonprofit educational institutions. The foundation would continue the research carried on by the association during the past five years. Under this program 23 separate projects had been financed in 17 states.

The U.S. public health service made \$625,000 available for research grants and fellowships in the nursing field during the fiscal year which began July 1, 1955.

A new system of collecting uniform data regarding nursing throughout the nation was being developed through a new registration form for use of state boards of nursing. Twenty-seven state boards planned to use the new form in 1956.

The number of nurses had increased rapidly in recent years, but the profession had not been able to satisfy the demand for its services, brought on by the growth in population, increasing use of health insurance and medical and scientific advances. The greatest shortage was in supervisory, administrative and nursing education personnel.

The trend toward shorter hospital stays had brought about an expansion of programs for home care of the sick. The result was a greater demand on public health nursing for care in the home and greater community needs for expanded public health service. Plans were begun in 1955 to examine this area of need to the end that organized nursing care would eventually be available to everyone.

In 1955, 324 schools of nursing in the United States were fully accredited and 649 had temporary accreditation, out of a total of 1,139 state approved schools. Nursing education was experimenting with a two-year program in junior colleges to prepare nurses for staff positions. During 1955 the Commonwealth foundation made available a grant of \$150,000 for fellowship aid for students of nursing.

Great strides were taken in improving the service of nursing aides who work in hospitals. In the first nine months of the year regional teacher-trainer institutes were held and 104 teacher-trainers were prepared. An estimated 72,000 nursing aides had been reached through this program since Feb. 1954.

Four regional councils of state leagues for nursing, which are constituents of the National League for Nursing, were formed in order to work more effectively with other regional groups to study the needs and plan to meet the social and health needs of each region.

The differences between professional and practical nursing and areas of responsibility of nurses in medical practice was clarified. A definition of the practice of nursing for purposes of law was developed by the American Nurses' association in 1955 and was being recommended for inclusion in state licensing laws. The definition reads: "The practice of professional nursing means the performance for compensation of any act in the observation, care and counsel of the ill, injured or infirm, or in the maintenance of health or prevention of illness of others, or in the supervision and teaching of other personnel, or the administration of medications and treatments as pre-

scribed by a licensed physician or dentist; requiring substantial special judgment and skill and based on knowledge and application of the principles of biological, physical and social science. The foregoing shall not be deemed to include acts of diagnosis or prescription of therapeutic or corrective measures.

"The practice of practical nursing means the performance for compensation of selected acts in the care of the ill, injured or infirm under the direction of a registered professional nurse or a licensed physician or a licensed dentist; and not requiring the substantial specialized skill, judgment and knowledge required in professional nursing."

On Aug. 9, Pres. Dwight D. Eisenhower signed a bill to provide commissions for qualified men nurses and other medical specialists' services. This amendment to the Army-Navy act of 1947 ended a decade of effort on the part of the nursing profession to achieve this legislation.

When the Associated Hospitals Service Inc. and United Medical Service Inc. approved extension of protracted sickness and accident insurance at its national meeting, benefits included private duty nursing service, covering 80% of such charges for 240 hours of service after the first 24 hours. (G. Gs.; J. L. CN.)

Nutrition, Experimental. **Exercise and Obesity.**—In order to evaluate experimentally the influence of physical activity upon body weight, J. Mayer and coworkers subjected mature rats and mice to a program of forced exercise on an electrically driven treadmill. The first phase of the work was aimed at an evaluation of different amounts of work on both food intake and body weight. Twelve rats were exercised each day for varying periods of time up to two hours, six rats for periods of three to six hours and three rats for periods greater than six hours. For short durations of time (20 minutes to one hour) there was no corresponding increase in food intake, in fact, food intake decreased slightly but significantly. Body weight also decreased. For longer durations of exercise (one to six hours) food intake increased in proportion to the increase in physical activity and weight was maintained. For long durations of exercise (more than six hours) the animals lost weight, their food intake decreased and their appearance deteriorated. This work showed that it may not be correct to assume that an individual's caloric needs can be calculated as the sum of his basal (inactive) caloric expenditure plus the calories required for his physical activities.

The other part of the study involved an examination of the influence of exercise on the development of obesity in mice. Nonobese and genetically obese mice, all accustomed to a sedentary existence, were exercised on a treadmill for one hour a day. Changes in weight were compared with those of nonobese and obese mice not exercised. The inactive obese mice showed a progressive increase in body weight. The exercised obese mice also increased their body weights during this time, but the weight gain was only one-half that of the inactive group. The difference in the rate of weight gain occurred even though the exercised obese mice ate one and one-half times as much food as the inactive ones. Exercise did not affect the weight of the nonobese mice. There was no difference in the body weights of the exercised and inactive nonobese mice throughout the experiment. The results of this study illustrated again the importance of considering exercise as well as food intake in problems of obesity.

Radiation in Food Processing.—Foods are processed primarily to inactivate enzymes and to kill harmful microorganisms. For years research had been conducted on the possibility of sterilizing foods by bombarding them with electrons or X-rays (the so-called cold sterilization of foods). Radiation-sterilized foods packaged in thin aluminum or plastic containers would

obviate the necessity for refrigeration and, in addition, effect a saving in space.

Such a method would have value for the civilian market and the military. H. F. Kraybill reported some of the possibilities and problems of the radiation process and its nutritive effects on foods. Radiation sterilization was successful in breaking the trichina larval cycle in pork, controlling insect infestation of cereal products, extending fivefold the shelflife of prepackaged meats and inhibiting the sprouting of potatoes. Potential hazards from the radiation process, the costs of shielding and the effect on nutritive quality of the processed food were problems which had to be considered. The dosage required for food sterilization and enzyme inactivation produced certain undesirable off-flavours, odours, colours and texture changes.

The changes in nutritive value of foods exposed to high-energy radiations was the subject of extensive investigations. In work done with milk and milk products, vitamin A, tocopherols and ascorbic acid were highly sensitive to gamma-radiation at the sterilization dose, carotenoids and riboflavin were moderately sensitive and the enzyme phosphatase was only slightly changed. Certain naturally occurring protective substances or radioresistant compounds were found in foods. It was observed that cysteine and ascorbic acid can be used to eliminate off-flavours in foods.

During irradiation some degradative changes also occur in the macronutrients, especially fats and proteins with sulphur-containing dipeptides. These changes and pigmental changes which not only give rise to discoloration but also result in off-flavours were produced in meats. Large-scale animal feeding experiments concerned with the nutritional and physiologic aspects of feeding irradiated foods to test animals had been initiated only in the past few years. Experiments with rats fed on irradiated foods showed that there was an impairment in the fertility of the male and increased mortality in litters, probably as a result of the destruction of vitamin E. More research such as this was necessary before commercial irradiation of foods could become a reality.

Dental Caries.—Although much experimental work had been done on the relation of diet to the incidence of dental caries, little attention was paid to the possible effects of the physical consistency of the diet. J. H. Shaw, in a study of the effect of increased mastication on the incidence of caries, discovered some interesting but perplexing facts. In one experiment, using postweanling cotton rats of a caries-susceptible strain, some rats were fed exclusively on a caries-producing diet while the ration of other rats was diluted with a nonnutrient material to force a greater food intake and thus more extensive mastication. The inclusion of 10% agar or amounts of cellulose flour varying from 10% to 100% did not alter the dental caries incidence. In a second experiment, similar in design to the first, the inclusion of 10% to 50% cellulose flour in the caries-producing diet did not alter the dental caries incidence in the animals. The third and fourth experiments involved the use of a synthetic resin low-molecular-weight polyvinyl acetate in the ration. The inclusion of amounts varying from 5% to 20% of a finely powdered polyvinyl acetate in the ration of a purified diet caused a much lower incidence of dental caries than in animals fed only the caries-producing diet. However, the inclusion of 20% polyvinyl acetate in the ration in such a way as to produce a firm cake which required a great deal of mastication did not reduce the dental caries incidence further than the inclusion of 20% polyvinyl acetate in finely powdered form. In the last experiment the effectiveness of the low-molecular-weight polyvinyl acetate used in experiments 3 and 4 was compared with that of a high-molecular polyvinyl acetate, natural chicle and arochem. All supplements were fed at the 10% level,

and all were effective in reducing the incidence and severity of caries.

These data as a whole did not provide any concrete evidence that the amount of mastication required in the consumption of a caries-producing diet is a determining factor in the incidence of dental caries. The author suggested that the effective supplements used in his experiments exerted some cleansing action in the oral cavity or specifically on the tooth surface. Another possibility might be that these substances deposited a protective film on the teeth. He noted that rats receiving the protective supplements had cleaner mouths and glossier teeth than did animals receiving the basal ration alone.

Algae for Food.—Since ancient times many people in various parts of the world have eaten seaweed as a food. Today alginic acid, prepared from algae, is used in large amounts as a stabilizer by the food industry. An interesting preliminary study on the possible future mass production and processing of the algae *Chlorella* as a food for humans was reported by Y. Morimura and N. Tamiya. The authors used the dried cells of *Chlorella ellipsoidea* in a powdered form, which was green in colour, to enrich French bread, rolls, noodles, Japanese-style green tea and ice cream in amounts ranging from 2% to 20%. These products were described as "tasty" and "agreeable" by several Japanese and American adults and were said to be an "agreeable" light green colour.

Various soups as well as a substitute for soy sauce were all successfully prepared using *Chlorella* cells. Significant amounts of protein, fat, minerals and certain vitamins were contributed to the nutrient composition of the foods by the *Chlorella* cells. The large amounts of vitamin A and ascorbic acid in the food products were particularly outstanding. By direct analysis each gram (dried weight) of the *Chlorella* cells contained 5,000 I.U. of vitamin A (as carotene) and 2 to 5 mg. of ascorbic acid. Further studies such as these were important because of the possibility they offered for stretching future world food supplies. The acceptability of these foods would depend largely on economic conditions and changing food habits in the future. (See also VITAMINS AND NUTRITION.)

Tamiya, "Preliminary Experiments in the Use of *Chlorella* as Human Food," *Food Technology* 8:179-182 (April 1954). (M. B. McC.; F. J. Se.)

Nuts. The nut supply of 1955, both domestic and foreign, was the smallest in a decade; most types were below average in supply, thus reducing the feasibility of substitution. The 1955 U.S. crop of tree nuts was a small one, approximating the small one of 1954 and about 6% below the average for 1944-53. A late March freeze in the pecan area of the south did much damage; high temperatures in California reduced the walnut crop by 15,000 tons and lowered quality.

Pecan production, indicated at 91,550,000 lb., was slightly larger than the small crop of 1954 but far below the 141,437,000-lb. average for 1944-53. Wild or seedling varieties, produced mostly in Oklahoma, Texas and Louisiana, were indicated at 68,430,000 lb. as compared with 51,550,000 lb. in 1954 and an average 76,387,000 lb.

Improved varieties were only one-third of a normal crop amounting to 23,120,000 lb. as compared with 38,960,000 lb. in 1954. Georgia, sometimes the leading producer, had only one-tenth of an average crop. Early contract prices were approximately twice as high as those of 1954.

The California almond crop of 37,600 tons was 15% less than

1954 and below average. Early prices were about 45 cents per pound as compared with 32 cents in 1954. The foreign almond crop was indicated as smaller than in 1954, and the quota limitation of 5,000,000 lb., of which less than half was filled in 1954-55, was continued for 1955-56. Italy and Spain were indicated as producing a short crop of 44,000 tons as compared with 52,000 tons in 1954.

The 1955 U.S. filbert crop of 6,800 tons, mostly from Oregon, was more than one-fifth below that in 1954 and 12% below average. The opening price of 29 cents per pound was a ten-year high, 2 cents more than in 1954. With prospects of a smaller foreign crop the quota limitations on imports of 7,500,000 lb. were continued for 1955-56. Excess would be assessed a ten cent special fee per pound. The filbert crop of Italy was indicated as a bumper one of 44,000 tons as compared with 23,000 tons in 1954. Turkey, the dominant producer, was indicated for a small crop of 50,000 tons as compared with a record 125,000 tons in 1954. Spain had another small crop.

The 1955 U.S. crop of Persian (English) walnuts, produced mostly in California, was indicated at 76,700 tons, as compared with 75,400 tons in 1954 and 72,310 tons average for 1944-53. Opening prices were as high as 45 cents per pound.

The Turkish 1955 crop was reported as providing an export surplus of 2,000 tons as compared with 3,800 tons in 1954. Prices were strong. The Italian crop was estimated at 22,000 tons compared with only 12,700 tons in 1954.

India entered the world walnut trade after having harvested about 11,000 tons in Kashmir late in 1954. (See also PEANUTS.) (J. K. R.)

Nyasaland: see RHODESIA AND NYASALAND, FEDERATION OF.

Oats. The 1955 U.S. oat crop was a record large one of 1,636,-030,000 bu.; that of 1954 was 1,499,579,000 bu., and the 1944-53 average crop was 1,323,321,000 bu. The acreage sown for all purposes was 47,634,000 ac. and the harvested acreage was indicated at 42,009,000 ac., as compared with 42,151,000 ac. in 1954 and 39,556,000 ac. average for 1944-53. Average yields were 38.9 bu. per acre, as compared with 35.6 bu. per acre in 1954 and 33.4 bu. per acre for the decade 1944-53. Iowa, as usual, was the leading producer (264,910,000 bu.), followed by Minnesota (202,734,000 bu.) and Illinois (182,115,000 bu.).

Table I.—U.S. Oat Crops

	Indicated 1955	1954	Average, 1944-53
Total production (thousands of bushels)	1,636,030	1,499,579	1,323,321
Acreage harvested (thousands)	42,009	42,151	39,556
Yields (bushels per acre)	38.9	35.6	33.4

Carry-over stocks from previous crops were 315,000,000 bu., 23% higher than the 233,000,000 bu. in 1954 and 10% above the 266,000,000 bu. average for 1944-53. Imports prior to Oct. 1 were only about 20,000,000 bu., as compared with a quota of 40,000,000 bu. and actual imports in 1953 of about 80,000,000 bu. Consequently, a new limiting quota was not imposed. The official support price on the 1955 crop was reduced to 61 cents per bushel at the farm, as compared with 75 cents on the 1954 crop. Prices, too, declined to about 59 cents per bushel to the producer in October against 73 cents a year earlier. Nearly 75,-000,000 bu. from the 1954 crop were placed under price support, as compared with about 56,000,000 bu. in 1953 and 21,700,000 bu. in 1952. Exports, largely of government-held oats, were 12,000,000 bu. in 1954-55, as compared with minor amounts in the previous year.

An indicated world oat crop of 4,335,000,000 bu. was the largest of the post-World War II period and comparable with 4,295,000,000 bu. in 1954 and a prewar (1935-39) average of 4,365,000,000 bu. Production in Europe and the U.S.S.R. was

not up to prewar, partly because of acreage shifts to other crops. The Canadian crop was about one-third larger than in 1954. Only 1,281,000 tons of oats moved in world trade in

Table II.—Oat Production of the Principal Producing Countries

Country	(In thousands of bushels) Indicated 1955*	1954	Average, 1945-49	Average, 1935-39
United States	1,636,030	1,499,579	1,376,527	1,045,329
U.S.S.R.	720,000	1,165,000
Canada	409,991	306,793	341,612	338,071
France	244,140	246,220	221,821	329,304
United Kingdom	179,550	170,800	204,692	138,628
Western Germany	171,340	170,370	144,500	194,500
Argentina	61,320	47,782	50,182

*Preliminary estimate.

1954-55, compared with 2,187,038 tons in the preceding year. Exports from Canada were less than one-third of those in 1953-54. (J. K. R.)

Obituaries. The following is a selected list of prominent men and women, of the United States and other countries, who died during the year 1955:

Abend, Hallett Edward, U.S. journalist and author (b. Portland, Ore., Sept. 15, 1884—d. Sonora, Calif., Nov. 27, 1955).

Abt, Isaac Arthur, U.S. pediatrician (b. Wilmington, Ill., Dec. 18, 1867—d. Chicago, Ill., Nov. 22, 1955), helped establish pediatrics as an important separate branch of medical practice at a time when children's diseases were considered almost identical with those of adults. Graduating from Chicago Medical college (then an affiliate of Northwestern university) in 1891, Abt took postgraduate work in Vienna and Berlin, and began to specialize in diseases of children both as teacher and physician. From 1909 until his retirement in 1942 he was professor at the Northwestern university medical school in Chicago. Abt was author-editor of an eight-volume classic *System of Pediatrics*, prepared in collaboration with other specialists, and of many other books and professional articles on the diseases of children.

Adler, Julius Ochs, U.S. publisher and army officer (b. Chattanooga, Tenn., Dec. 3, 1892—d. New York, N.Y., Oct. 3, 1955), was a member of the family long associated with publication of the *New York Times* and *Chattanooga Times* (Tenn.). Aside from his managerial positions with both papers (vice-president and general manager of the former and president and publisher of the latter from 1935 until his death), Adler acquired separate prominence in a military career. A year after graduation from Princeton university in 1914 he attended the first civilian training camp for officers at Plattsburg, N.Y., and was commissioned second lieutenant of cavalry in 1917, later advancing to the rank of major general, reserve, in 1948. In World War I he served with distinction as an infantry officer of the U.S. 77th division in France, and received the distinguished service cross and the silver star. Continuing as a reserve officer between the two world wars, he was appointed assistant commander of the U.S. 6th infantry division in Sept. 1941, and later saw action against the Japanese in New Guinea and Papua. Gen. Adler retired from the army in Dec. 1954 but continued his military career as chairman of the National Security Training commission.

Agganis, Harry, U.S. athlete (b. Lynn, Mass., 1929?—d. Cambridge, Mass., June 27, 1955).

Agnew, Hugh Elmer, U.S. marketing authority (b. Hillsdale County, Mich., Jan. 31, 1875—d. Manhasset, N.Y., July 30, 1955).

Aikman, Duncan, U.S. newspaperman and author (b. Terre Haute, Ind., 1889—d. Chevy Chase, Md., Dec. 14, 1955).

Albert, Archduke, OF THE HOUSE OF HABSBURG-LORRAINE, PRINCE OF HUNGARY AND DUKE OF TESCHEN (b. July 24, 1897—d. Buenos Aires, Arg., July 23, 1955).

Alington, Very Rev. Cyril Argentine, British clergyman, educator and author (b. Ipswich, Eng., Oct. 22, 1872—d. Treago, Eng., May 16, 1955).

Allee, Warder Clyde, U.S. zoologist (b. near Bloomingdale, Ind., June 5, 1885—d. Gainesville, Fla., March 18, 1955).

Allen, William Ray, U.S. zoologist and author (b. Ossian, Ind., March 8, 1885—d. Lexington, Ky., April 7, 1955).

Alness, Robert Munro, 1ST BARON OF, British lawyer and politician (b. Alness, Ross, Eng., May 28, 1868—d. Bournemouth, Eng., Oct. 6, 1955).

Altrincham, Edward William Macleay, 1ST BARON OF, British journalist and politician (b. Sept. 8, 1879—d. Badminton, Eng., Dec. 1, 1955).

Amery, Leopold Charles Maurice Stennett, British politician (b. Gorakhpur, India, Nov. 22, 1873—d. London, Eng., Sept. 16, 1955).

Ames, Adelbert Jr., U.S. optics authority (b. Lowell, Mass., Aug. 19, 1880—d. Hanover, N.H., July 3, 1955).

Archibald, Raymond Clare, U.S. mathematician (b. Colchester, N.S., Oct. 7, 1875—d. Sackville, N.B., July 26, 1955).

Arciszewski, Tomasz, Polish statesman (b. Vitebsk, Byelorussia, Nov. 22, 1877—d. London, Eng., Nov. 20, 1955).

Arida (ANTOINE PIERRE), 102nd Lebanese Maronite patriarch (b. Becharré [Bsherr] Leb., Aug. 2, 1863—d. Beirut, Leb., May 19, 1955), was leader of the Maronites, a Syriac religious body in communion with the Roman Catholic Church since 1736. Trained at the Maronite college in Rome and ordained on June 29, 1890, Msgr. Arida often visited Europe with his predecessor, later becoming secretary of the patriarchal court. He was made bishop of Tripoli (Lebanon) in 1908 and in this high position his abilities as administrator and pastor, linked with his political impartiality, led to his election as patriarch of Antioch and all the orient in 1932.

Arnett, Trevor, U.S. finance authority (b. Little Hereford, Eng., Nov. 8, 1870—d. Fort Lauderdale, Fla., March 31, 1955).

Arnheim, Gus, U.S. band leader and song writer (b. Philadelphia, Pa., Sept. 11, 1897—d. Beverly Hills, Calif., Jan. 19, 1955).

Arze, José Antonio, Bolivian educator and lawyer (b. Cochabamba, Bol., Jan. 13, 1904—d. Cochabamba, Aug. 23, 1955).

Ascarì, Alberto, Italian auto racing driver (b. 1918?—d. Monza, It., May 26, 1955).

Aswell, James, U.S. author and newspaperman (b. Baton Rouge, La., April 27, 1906—d. Natchitoches, La., Feb. 23, 1955).

Avila Camacho, Manuel, Mexican statesman (b. Teziutlán, Mex., April 24, 1897—d. near Mexico City, Mex., Oct. 13, 1955), participated in the successful revolution against Victoriano Huerta in 1914, attaining the rank of general. In the cabinet of A. L. Rodríguez, elected president in 1932 to fill an unexpired term, Avila Camacho was minister of war and navy; and in the cabinet of Pres. Lázaro Cárdenas (1934-40) he was minister of national defense. Cárdenas personally selected Avila Camacho as his successor and he was elected president of Mexico July 7, 1940, by an overwhelming vote—2,476,641 to 151,101. He took office the following Dec. 1.

Avila Camacho's administration was more moderate in its domestic policies than were those of his predecessors, and was marked by friendship for the U.S. Under his leadership, Mexico declared war on Germany, Italy and Japan in June 1942 and joined the United Nations. His government also introduced a national campaign against illiteracy and re-established amicable relations with the Catholic Church. His term of office expired Dec. 1, 1946, when he was succeeded by Miguel Alemán Valdés.

Ayers, Roy Elmer, U.S. lawyer, politician and congressman (b. near Lewistown, Mont., Nov. 9, 1882—d. Lewistown, May 23, 1955).

Bahadur, Maharaja Sir Bhopal Sinhi, Indian prince (b. Feb. 22, 1884—d. Udaipur City, Ind., July 4, 1955).

Baird, David Jr., U.S. senator and business executive (b. Camden, N.J., Oct. 10, 1881—d. Camden, Feb. 28, 1955).

Baker, Leonard Theodore, U.S. educator (b. Charleston, S.C., Jan. 22, 1868—d. Columbia, S.C., Jan. 5, 1955).

Ball, George Alexander, U.S. manufacturer, financier and philanthropist (b. near Greensburg, O., Nov. 5, 1862—d. Muncie, Ind., Oct. 22, 1955), helped organize, with three of his brothers, the vast Mason fruit jar industry at Muncie, Ind., acting as president of the Ball Brothers company from 1944 to 1947 and chairman of the board thereafter. For a short time in 1935 he had control of the Van Sweringen railroad properties and in that year founded the George and Frances Ball philanthropic foundation.

Ball, Suzan, U.S. actress (b. Buffalo, N.Y., Feb. 3, 1934—d. Hollywood, Calif., Aug. 5, 1955), was a model after attending high school in North Hollywood, Calif., and made her motion-picture debut in *Untamed Frontier* in 1952. She appeared in several other pictures before undergoing amputation of her right leg, infected with cancer. A short time later, in April 1954, she married Richard Long, an actor with whom she appeared in a television play about a handicapped girl that received national attention. Her last motion picture, *Chief Crazy Horse*, in which she starred with Victor Mature, opened in New York city a few months before her death of cancer.

Ballou, Richard Boyd, U.S. educator (b. Worcester, Mass., Aug. 26, 1910—d. Highland Park, N.J., April 18, 1955).

Bara, Theda (THEODOSIA GOODMAN), U.S. motion-picture actress (b. Cincinnati, O., 1890—d. Los Angeles, Calif., April 7, 1955), was one of the most publicized feminine "vampires" of the silent motion-picture era. As an unknown extra, she was first starred in William Fox's *A Fool There Was* (1914), one of the most successful movie "hits" of the time. In the following years she appeared in 40 or more Fox productions, including notably the roles of Carmen (1915), Juliet (1916) and Cleopatra (1917). Other pictures of hers were *Madame Du Barry*, *The Tiger Woman*, *Forbidden Path* and *Her Greatest Love*. Her acting career did not long survive the coming of the sound motion picture and came to a close in the early 1920s. She was married to Charles J. Brabin, a director, in 1921.

Barclay, Edwin James, Liberian politician (b. 1882—d. Liberia, Nov. 6, 1955).

Bauer, Marion Eugenia, U.S. composer and author (b. Walla Walla, Wash., Aug. 15, 1887—d. South Hadley, Mass., Aug. 9, 1955).

Baumeister, Willi, German painter (b. Stuttgart, Ger., Jan. 22, 1889—d. Stuttgart, Sept. 1, 1955).

Bay, Charles Ulrick, U.S. diplomat (b. Rensselaer, N.Y., Sept. 5, 1888—d. New York, N.Y., Dec. 31, 1955).

Baydur, Hüseyin Ragip, Turkish diplomat (b. Island of Rhodes, 1890—d. London, Eng., Feb. 26, 1955).

Beazley, Sir (Charles) Raymond, British historian (b. Blackheath, Eng., April 3, 1868—d. Birmingham, Eng., Feb. 1, 1955).

Beecher, Janet, U.S. actress (b. Jefferson City, Mo., Oct. 21, 1884—d. Washington, Conn., Aug. 6, 1955).

Bentley, Madison, U.S. psychologist, author and editor (b. Clinton, Iowa, June 18, 1870—d. Palo Alto, Calif., May 29, 1955).

Berkey, Charles Peter, U.S. geologist (b. Goshen, Ind., March 25, 1867—d. Palisade, N.J., Aug. 22, 1955).

Bernardes, Arthur da Silva, Brazilian statesman (b. Viçosa, Minas Gerais, Braz., Aug. 18, 1875—d. Rio de Janeiro, Braz., March 23, 1955), received his law degree from the University of São Paulo in 1900 and served as federal deputy and senator; he was president of the state of Minas Gerais from 1918 to 1922 and president of Brazil from 1922 to 1926. The start of his administration was marked by a policy of strict retrenchment in the post-World War I boom, but he was soon beset by an economic collapse and by a series of military revolts. Bernardes, founder of the Brazilian Republican party, remained active in national politics until shortly before his death.

Bethune, Mary McLeod, U.S. educator (b. Mayesville, S.C., July 10, 1875—d. Daytona Beach, Fla., May 18, 1955), graduated from the normal school of Scotia seminary, Concord, N.C., in 1893, and from the Moody Bible insti-

tute, Chicago, Ill., two years later. After teaching in two southern schools she helped found, in 1904, the Daytona (Fla.) Normal and Industrial School for Girls—subsequently renamed Bethune-Cookman college. A long time leader in U.S. Negro affairs, she was a director of the Division of Negro Affairs of the National Youth administration from 1936 to 1944 and a special adviser to Pres. Franklin D. Roosevelt on problems of U.S. minorities. She was also a vice-president of the National Association for the Advancement of Colored People and a Spingarn medalist.

Bhatnagar, Sir Shanti Swarupa (b. Bhera, Shahipur district, Punjab, India, Feb. 21, 1895—d. New Delhi, India, Jan. 1, 1955), was widely considered to be India's greatest contemporary scientist. Educated at Lahore, London and Berlin universities, he was from 1924 to 1940 director of the chemical laboratories of the University of the Punjab, during which period he wrote numerous papers on physical chemistry. In 1940, he undertook scientific work for the government and was later appointed secretary of the Indian ministry of natural resources and scientific research. Bhatnagar made an outstanding contribution to industrial progress (especially since 1947), encouraging multifarious projects including the building of scientific institutions and the manufacturing of plastics and textiles. He was knighted in 1941.

Bigelow, Maurice Alpheus, U.S. biologist and writer (b. Milford Center, O., Dec. 8, 1872—d. Peekskill, N.Y., Jan. 6, 1955).

Blackwell, Carlyle, U.S. actor and director (b. Troy, Pa., 1888—d. Miami, Fla., June 17, 1955).

Boas, Ernst Philip, U.S. heart specialist (b. Worcester, Mass., Feb. 4, 1891—d. New York, N.Y., March 9, 1955).

Bonham-Carter, Sir Charles, British army officer and administrator (b. Feb. 25, 1876—d. Petersfield, Hamps., Eng., Oct. 21, 1955).

Booth, George Francis, U.S. editor and publisher (b. Hartford, Conn., Nov. 11, 1870—d. Bass Rock, Mass., Sept. 1, 1955).

Booth, Hubert Cecil, British inventor (b. Glasgow, Scot., 1871—d. Croydon, Eng., Jan. 14, 1955).

Boucher, Chauncey Samuel, U.S. historian and educator (b. Chicago, Ill., June 14, 1886—d. Petoskey, Mich., Aug. 13, 1955).

Braun, Otto, German statesman (b. Königsberg, Ger., Jan. 28, 1872—d. Lugano, Switz., Dec. 14, 1955).

Breguet, Louis Charles, French aircraft manufacturer (b. Paris, Fr., Jan. 2, 1880—d. Paris, May 4, 1955).

Bridoux, Eugène, French army officer and politician (b. Doulon, Fr., June 24, 1888—d. Madrid, Sp., June 6, 1955).

Brown, Sir (John Alfred) Arnesby, British painter (b. Nottingham, Eng., 1866—d. Haddiscoe, Eng., Nov. 16, 1955).

Brown, Fred Herbert, U.S. senator (b. Ossipee, N.H., April 12, 1879—d. Somersworth, N.H., Feb. 3, 1955).

Brown, Louise Fargo, U.S. historian (b. Buffalo, N.Y.—d. Norfolk, Va., May 1, 1955).

Brues, Charles Thomas, U.S. zoologist and author (b. Wheeling, W.Va., June 20, 1879—d. Crescent City, Fla., July 22, 1955).

Bruno, Frank John, U.S. sociologist (b. Florence, It., June 1, 1874—d. Lebanon, Ind., Aug. 7, 1955).

Bryan, Charles Faulkner, U.S. composer (b. McMinnville, Tenn., July 26, 1911—d. Pinson, Ala., June 7, 1955).

Bryan, William Lowe, U.S. educator (b. near Bloomington, Ind., Nov. 11, 1860—d. Bloomington, Nov. 21, 1955).

Bryant, Eliot Hinman, U.S. naval officer (b. Rusheville, Ill., Aug. 21, 1896—d. Annapolis, Md., Oct. 16, 1955).

Buchanan, George, British politician (b. Glasgow, Scot., Nov. 30, 1890—d. Glasgow, June 28, 1955).

Buchanan, Vera Daerr, U.S. politician (b. Wilson, Pa., July 20, 1902—d. McKeesport, Pa., Nov. 26, 1955).

Burkhard, Willy, Swiss composer (b. Evillard-sur-Bienne, Switz., April 17, 1900—d. Zurich, Switz., June 18, 1955).

Burns, Edward H(arold), U.S. sports writer (b. Frankfort, Ind., Jan. 17, 1891—d. Chicago, Ill., Jan. 27, 1955).

Burns, Robert Elliott, U.S. ex-convict author (b. Brooklyn, N.Y., 1891?—d. East Orange, N.J., June 5, 1955), was sentenced as a young man to 6-10 years' imprisonment in Atlanta, Ga., for taking part in a robbery. He escaped from a convict's chain gang in Georgia in 1922 and for seven years remained at liberty, becoming a successful magazine editor in Chicago, Ill. Returned to prison in Georgia in 1929, he escaped again the following year and fled to New York City, where he wrote the best-selling *I Am a Fugitive from a Georgia Chain Gang* (1932). Later his prison sentence was voided and his full civil rights were restored by the Georgia authorities.

Burns, Tommy (NOAH BRUSSO), Canadian-U.S. boxer (b. Hanover, Ont., June 17, 1881—d. Vancouver, B.C., May 10, 1955), won the heavyweight boxing championship of the world in 1906 (although it was temporarily disputed) and lost it two years later to Jack Johnson at Sydney, Austr. After Burns' retirement from boxing in 1920 he was at one time an evangelist. During 60 professional bouts in his boxing career he lost only five.

Busse, Henry, U.S. orchestra leader and composer (b. Magdeburg, Ger., May 19, 1894—d. Memphis, Tenn., April 23, 1955).

Butler, Robert, U.S. diplomat and business executive (b. St. Louis, Mo., July 16, 1897—d. New York, N.Y., Sept. 15, 1955).

Cahill, Lily, U.S. actress (b. Texas, 1886?—d. San Antonio, Tex., July 20, 1955).

Cameron, George Toland, U.S. publisher and industrialist (b. Red Bluff, Calif., March 16, 1873—d. San Francisco, Calif., Oct. 3, 1955).

Cannon, John Kenneth, U.S. army officer (b. Salt Lake City, Utah, March 9, 1892—d. Arcadia, Calif., Jan. 12, 1955).

Carnegie, Dale, U.S. author, lecturer and popularizer of courses in public speaking and personality development (b. Maryville, Mo., Nov. 24, 1888—d. Forest Hills, N.Y., Nov. 1, 1955), was perhaps best known for his book *How to Win Friends and Influence People*, which sold almost 5,000,000 copies in 29 languages from the time it was first published in 1936 until its author's death. Graduating from the State Teachers college at Warrensburg, Mo., in 1908, Carnegie was a salesman before becoming a teacher of public speaking.

in 1912 in New York city. His courses in this subject were taken by an estimated 450,000 people up to the time of his death, principally in the U.S. but also in 15 other countries. Carnegie was the author of several other works, including a biography of Abraham Lincoln (1932) and another best-selling book on the philosophy of successful living, *How to Stop Worrying and Start Living* (1948).

Carpenter, Alfred Francis Blakeney, British admiral (b. Sept. 17, 1881—d. Gloucestershire, Eng., Dec. 27, 1955).

Carter, Amon Giles, U.S. newspaper publisher (b. Crafton, Tex., Dec. 11, 1879—d. Fort Worth, Tex., June 23, 1955), was born of an impoverished family and left school at the age of 11. He worked as a salesman and in the advertising business, and in 1906 he and two associates founded the *Fort Worth Star* (Tex.). This paper was later merged with the *Telegram* of that city to become one of the nation's most successful dailies, the *Fort Worth Star-Telegram*. Successful also in oil and other ventures, he established the multi-million-dollar Amon G. Carter foundation, primarily for educational philanthropy.

Chace, Malcolm Greene, U.S. industrialist (b. Central Falls, R.I., 1875—d. Hyannis, Mass., July 16, 1955).

Chambellan, René Paul, U.S. sculptor (b. West Hoboken, N.J., Sept. 15, 1893—d. Cliffside Park, N.J., Nov. 29, 1955).

Charles, Sir (James) Ronald (Edmonton), British army officer (b. June 26, 1875—d. Ilminster, Eng., Dec. 24, 1955).

Charney, Samuel (S. NIGER), Yiddish author (b. Dukor, Minsk, Russia, June 15, 1884—d. New York, N.Y., Dec. 24, 1955).

Chase, Beatrice (OLIVE KATHARINE PARR), British novelist (b. Harrow-on-the-Hill, Eng., July 5, 1874—d. Newton Abbot, Eng., July 3, 1955).

Chase, Harry Woodburn, U.S. educator (b. Groveland, Mass., April 11, 1883—d. Sarasota, Fla., April 20, 1955), graduated from Dartmouth college, Hanover, N.H., with a bachelor's degree in 1904, took his master's degree there in 1908, and his Ph.D. at Clark university, Worcester, Mass., in 1910. In the latter year he became professor of psychology at the University of North Carolina, Chapel Hill, and was elected president of that institution in 1919. In 1930 he resigned to accept the presidency of the University of Illinois, Urbana, and from 1933 until his retirement in 1951 he was chancellor of New York university, New York city. A confirmed liberal, Chase strove for the twin beliefs of equal educational opportunity and full academic freedom.

Chatterjee, Sir Atul Chandra, Indian politician (b. Nov. 24, 1874—d. Bexhill, Eng., Sept. 8, 1955).

Chaumeix, André, French journalist and editor (b. Felletin [Creuse], Fr., June 7, 1874—d. Paris, Fr., Feb. 23, 1955).

Chever, David, U.S. surgeon and educator (b. Boston, Mass., June 25, 1876—d. Wellesley, Mass., Aug. 13, 1955).

Chipkin, Israel Solomon, U.S. educator and author (b. Vilna, Pol., March 31, 1891—d. New York, N.Y., Oct. 25, 1955).

Clarendon, George Herbert Hyde Villiers, 6TH EARL OF, British administrator (b. June 7, 1877—d. London, Eng., Dec. 13, 1955).

Clark, David Worth, U.S. senator (b. Idaho Falls, Ida., April 2, 1902—d. Los Angeles, Calif., June 19, 1955).

Clark, Walter Ernest, U.S. educator and author (b. Defiance, O., June 9, 1873—d. Reno, Nev., May 1, 1955).

Claudel, Paul Louis Charles Marie, French poet, dramatist and diplomat (b. Villeneuve-sur-Fère-en-Tardenois, Aisne, Fr., Aug. 6, 1868—d. Paris, Feb. 23, 1955). Descended from a family closely connected with the land, Claudel received his early education at Bar-le-Duc and privately at Nogent-sur-Seine. In 1881 he went to Paris, where he attended the Lycée Louis-le-Grand. Although he failed his *baccalauréat*, he went on to study philosophy and law, and it was then that he discovered the poetry of Arthur Rimbaud, whose *Illuminations* not only had a profound influence on his work, but also first drew him toward Roman Catholicism, to which he became converted in 1886. The first version of his dramatic poem *Tête d'or*, which illustrated his rejection of classical French prosody, appeared in 1890. In 1892 he entered the French diplomatic service and in 1895 went to New York and Boston as vice-consul. Further appointments followed at Shanghai (1906) and Foochow. In 1901 he returned home to meet André Gide, with whom he had already corresponded and whom he tried for 25 years to convert to Catholicism, a struggle revealed by the publication of *Correspondance avec André Gide* (1949). He continued to serve in China and various parts of the far east, where his experience provided the material for *La connaissance de l'Est* and the play *Parlage de midi*. In 1909 he was assigned to Prague, then to Frankfurt-am-Main, Hamburg and Rome. He was appointed minister to Rio de Janeiro in 1916, to Copenhagen in 1919 and then served successively as ambassador to Japan, the United States and Belgium. In 1935, when he retired, the Académie Française rejected his application for membership, although he was admitted in 1946 without seeking election. A close associate of Mallarmé, Claudel was, in his work, at once individual and bewildering. His experiments with blank verse produced a supple, lyrical form peculiarly his own, which is seen at its best in the *Cinq grandes odes*. His dramatic work was always excited and dominated by his religious conviction, and achieved its greatest expression in *L'Annonce faite à Marie* (1912), *L'Otage* (1911) and

Le Soudier de satin (1924).

Clayton, John Bell, U.S. novelist (b. Craigsville, Va., Oct. 28, 1906—d. Newport Beach, Calif., Feb. 10, 1955).

Clement, William Tardy, U.S. marine corps officer (b. Lynchburg, Va., Sept. 27, 1894—d. Bethesda, Md., Oct. 17, 1955).

Coffin, Robert Peter Tristram, U.S. poet (b. Brunswick, Me., March 18, 1892—d. Portland, Me., Jan. 20, 1955), graduated from Bowdoin college, Brunswick, Me., in 1915 and took a master's degree at Princeton university the next year. Also in 1916 he was named Rhodes scholar at Oxford university, Eng., where, after a two-year service with the U.S. army as an artillery officer in France during World War I, he took two bachelor's degrees (1920-21). From 1921 to 1934 he taught English at Wells college, Aurora, N.Y., then returned to his alma mater, Bowdoin, as professor of English. His first volumes of verse appeared in the early 1920s, and thereafter he was a prolific writer, receiving the Pulitzer prize for poetry in 1936 for his *Strange Holiness*. His poetry and prose (including several novels) were based mostly on New England farm and seafaring life.

Collier, Constance (LAURA CONSTANCE HARDIE), British-U.S. actress (b. Windsor, Berks., Eng., Jan. 22, 1878?—d. New York, N.Y., April 25, 1955), made her first stage appearance in babyhood (her parents were Shakespearean actors) and by 1893 was in an operetta chorus, soon becoming one of the "Gaiety girls" of the 1890s. Her first starring role was in *One Summer's Day* in London in 1898. In 1901 she joined Sir Herbert Beerholm Tree's company in London and played in a number of Shakespearean roles. She made her Broadway debut in Oct. 1908 with William Gillette and subsequently starred in numerous plays both in England and the United States. In 1915 she entered motion pictures, appearing in notable roles in both silent and sound productions. Following her retirement from the stage and motion pictures she was a dramatic teacher and lecturer. Her autobiography, *Harlequinade*, was published in 1930, and she collaborated in writing several plays.

Colvin, Mamie White (MRS. DAVID LEIGH COLVIN), U.S. temperance leader (b. Westview, O., June 12, 1883—d. Clearwater, Fla., Oct. 30, 1955), was president of the Women's Christian Temperance union from 1944 to 1953, having served previously with various prohibition organizations since her graduation from Wheaton (Ill.) college in 1905. Her husband was the Prohibition party's candidate for president of the United States in 1936.

Comfort, William Wistar, U.S. educator (b. Philadelphia, Pa., May 27, 1874—d. Haverford, Pa., Dec. 24, 1955).

Conchoso Valdes, Aurelio Fernandez, Cuban diplomat (b. Sancti Spiritus, Las Villas, Cuba, June 27, 1896—d. near Patzcharo, Mex., Nov. 11, 1955).

Conroy, Peter Joseph, U.S. educator (b. Watervliet, N.Y., Oct. 26, 1894—d. Crestwood, N.Y., June 17, 1955).

Cooley, Anna Maria, U.S. educator (b. New York, N.Y., Sept. 16, 1874—d. Pawling, N.Y., May 6, 1955).

Cooper of Culross, Thomas Mackay Cooper, 1ST BARON OF DUNNET IN CAITNESS, Scottish jurist (b. Sept. 24, 1892—d. Edinburgh, Scot., July 15, 1955).

Cooper, Wyllis, U.S. motion picture and television writer and producer (b. Pekin, Ill., Jan. 26, 1899—d. Flemington, N.J., June 22, 1955).

Corbett, James Edward, British army officer, big-game hunter and author (b. Naini Tal, India, 1875—d. Nyeri, Ken., April 20, 1955).

Coty, Germaine, wife of the president of the French Republic (b. Le Havre, Fr., April 9, 1886—d. Rambouillet, Fr., Nov. 12, 1955).

Coudert, Frederic René Sr., U.S. lawyer (b. New York, Feb. 11, 1871—d. New York, April 1, 1955).

Courthope, George Loyd, 1ST BARON OF, British politician, barrister and naturalist (b. Whiligh, Sussex, Eng., June 12, 1877—d. Wadhurst, Sussex, Eng., Sept. 2, 1955).

Crane, Arthur Griswold, U.S. educator and state official (b. Davenport Center, N.Y., Sept. 1, 1877—d. Cheyenne, Wyo., Aug. 11, 1955).

Crouch, Paul, U.S. communist informer (b. North Carolina 1903?—d. San Francisco, Calif., Nov. 18, 1955).

Crowther, Frank, U.S. congressman (b. Liverpool, Eng., July 10, 1870—d. Pueblo, Colo., July 20, 1955).

Crozier, William John, U.S. physiologist (b. New York, N.Y., Aug. 28, 1892—d. Cambridge, Mass., Nov. 2, 1955).

Culbertson, Ely (Ilya), U.S. contract-bridge expert and crusader for world peace (b. Poyana de Vervilao, Rum., July 22, 1891—d. Brattleboro, Vt., Dec. 27, 1955), was the son of a U.S. oil prospector in Russia. Educated at Geneva (Switz.) university and at the Sorbonne in Paris, Fr., Culbertson in his youth was a revolutionary agent in the Russian Caucasus, Mexico and Spain. In 1921 he emigrated to the United States, where previously he had studied for a time at Yale and Cornell universities. Within a decade he became the world's leading authority on contract bridge, which became the most popular card game in the U.S. Culbertson founded and edited the *Bridge World* magazine and wrote many successful books and articles on bridge and other card games. After the outbreak of World War II Culbertson founded the World Federation, an organization designed to promote world peace through international police regulation. Following the foundation of the United Nations, the World Federation was converted into the Citizens Committee for United Nations Reform, of which Culbertson became chairman. One of the main objectives of the new organization was to persuade the UN to form an international police force.

1955 OBITUARIES: Theda Bara, U.S. motion-picture actress; Dale Carnegie, J.S. author; Robert P. Tristram Coffin, U.S. poet; Albert Einstein, German-Swiss-U.S. physicist; Sir Alexander Fleming, British bacteriologist

Cumberland, William Wilson, U.S. economist and educator (b. La Verne, Calif., Jan. 2, 1890—d. Englewood, N.J., Feb. 20, 1955).

Curley, William A., U.S. editor (b. New York, N.Y., 1874—d. New York, Oct. 23, 1955).

Curry, Lionel George, British publicist (b. Ledbury, Eng., Mar. 7, 1872—d. Kidlington, Eng. Nov. 24, 1955).

D'Amico, Silvio, Italian author, journalist and critic (b. Rome, It., Feb. 3, 1887—d. Rome, April 1, 1955).

Darlington, The Rev. Dr. Henry Vane Bearns, U.S. Episcopal clergyman (b. Brooklyn, N.Y., June 9, 1889—d. New York, N.Y., Dec. 20, 1955).

Darnley, Esme Ivo Bligh, 9th Earl of, British politician and artist (b. Oct. 11, 1886—d. Gravesend, Kent, Eng., May 29, 1955).

Davenport, Charles Edward ("Cow Cow"), U.S. composer and song writer (b. Anniston, Ala., April 26, 1895—d. Cleveland, O., Dec. 2, 1955).

Dávila, Carlos Guillermo, Chilean diplomat and journalist (b. Los Angeles, Chile, Sept. 15, 1887—d. Washington, D.C., Oct. 19, 1955), studied law at the University of Santiago but abandoned a legal career for journalism, founding the newspaper *La Nación* at Santiago in 1917. From 1927 to 1932 he was Chilean ambassador to the United States and in this post participated in the successful U.S. arbitration of the Tacna-Arica boundary dispute between Peru and Chile (May 1929). Returning to Chile in 1932, he founded the news magazine *Hoy* and in the same year was provisional president of Chile for three months (June-Sept.) under a military junta. Dávila then moved to New York city, where he founded a press service of U.S. news for Latin-American newspapers. From July 1954 until his death he was secretary-general of the Organization of American States in Washington, D.C.

Davis, Jesse Buttrick, U.S. educator (b. Chicago, Ill., March 2, 1871—d. Newton, Mass., Nov. 2, 1955).

Davis, John William, U.S. attorney and diplomat and Democratic candidate for president of the U.S. in 1924 (b. Clarksburg, W.Va., April 13, 1873—d. Charleston, S.C., March 24, 1955), graduated from Washington and Lee university, Lexington, Va., with a bachelor's degree in 1892, taking his law degree there three years later. In 1897 he became a partner in his father's law firm at Clarksburg and in 1899 was elected to the West Virginia state house of delegates. In 1910 he was elected to the U.S. house of representatives as a Democrat from the first West Virginia district, being re-elected in 1912 and serving on the house judiciary committee. He resigned a year later to accept appointment as U.S. solicitor general, serving until 1918, when he returned briefly to private law practice before his nomination as U.S. ambassador to Great Britain. During his ambassadorship (1918-21) he was an adviser to Pres. Woodrow Wilson at the Paris peace conference following World War I. A "dark horse" in the Democratic national convention of 1924, he was nominated for the presidency after 102 ballots had failed to resolve a deadlock between Alfred E. Smith and William G. McAdoo. In the following November national election he was defeated by the Republican candidate, Calvin Coolidge. Returning again to private practice, Davis continued active in his profession until shortly before his death. Two of his last cases were both decided against him in 1954—the U.S. supreme court's decision that public school segregation was unconstitutional, and the Atomic Energy commission's final ruling that J. Robert Oppenheimer was a security risk. (See also *Encyclopædia Britannica*.)

Deakin, Arthur, British trade unionist (b. Sutton Coldfield, Warwickshire, Eng., Nov. 11, 1890—d. Leicester, May 1, 1955), a cobbler's son, started work at the age of 13 in a steel plant near Merthyr Tydfil. He studied at night and by 1919 was a full-time official of the Dock, Wharf, Riverside and General Workers' union which later by amalgamation became the Transport and General Workers' union. In 1932 he became national secretary of the General Workers' group in London, where he formed a close association with Ernest Bevin, whose assistant he became in 1935 and whom he succeeded as general secretary of the T.&G.W.U. and on the general council of the Trades Union congress during and after World War II. He was chairman of the T.U.C. general council in 1951-52 and deputy chairman in 1952-53. In 1948 he was appointed a director of the *London Daily Herald*. Besides attending several International Labour organization conferences he was an official of the International Transport Workers' federation. During and after World War II he sat on many governmental and intergovernmental advisory committees, dealing in particular with transport, productivity and postwar reconstruction. In this way, and also by firmly opposing unofficial strike action, he showed his awareness of the transformed character of the trade union movement, seeking the welfare of labour not by strife but by co-operation, by patient negotiation and by increased productivity. He forcefully resisted the Communist element in the movement and in 1948, while presiding at a meeting of the World Federation of Trade unions in Paris, he denounced this body as a Communist instrument and led the withdrawal of the British and other delegations. He was then made a vice-president of the International Confederation of Free Trade unions. Deakin played an active part in averting the strike of locomotive engineers and firemen set for May 1, 1955, and while addressing a May day rally he collapsed and died.

Dean, James, U.S. motion picture actor (b. Marion, Ind. 1931—d. Paso Robles, Calif., Sept. 30, 1955).

Déat, Marcel, French politician and journalist (b. Guerigny, Fr., March 7, 1894—d. Turin, It., Jan. 5, 1955).

De Jong, Johannes, Dutch Roman Catholic prelate, (b. Nes, on the Frisian Island of Ameland, Sept. 10, 1885—d. Amersfoort, Sept. 8, 1955).

deMille, William Churchill, U.S. playwright (b. Washington, N.C., July 25, 1878—d. Los Angeles, Calif., March 5, 1955).

Denny, George Hutcheson, U.S. educator (b. Old Church, Va., Dec. 3, 1870—d. Lexington, Va., April 2, 1955).

Deutsch, Monroe Emanuel, U.S. educator (b. San Francisco, Calif., Aug. 17, 1879—d. San Francisco, Oct. 21, 1955).

Devoe, Alan (Taylor), U.S. naturalist and author (b. Montclair, N.J., Oct. 13, 1909—d. New York, N.Y., Aug. 17, 1955).

De Voto, Bernard (Augustine), U.S. author and critic (b. Ogden, Utah, Jan. 11, 1897—d. New York, N.Y., Nov. 13, 1955), ranged in his literary production from magazine fiction to notable works on U.S. history, biography and

literary criticism; he was an acknowledged authority on Mark Twain.

De Voto's undergraduate career at Harvard university was interrupted by infantry service in World War I, after which he received his bachelor's degree. He taught English at Northwestern university, Evanston, Ill., from 1922 to 1927 and while there published his first novels, *The Crooked Man* (1924) and *The Chariot of Fire* (1926). From 1929 to 1936 he taught and lectured at Harvard; he was editor of the *Saturday Review of Literature* from 1936 to 1938 and of the "Easy Chair" department of *Harper's Magazine* from 1935 until his death. His volume of U.S. western history, *Across the Wild Missouri* (1947; part of a trilogy, *The Course of Empire*, published in 1952) was awarded the Pulitzer history prize in 1948. That same year he also received one of the original two Bancroft prizes, awarded by Columbia university for distinguished historians.

An often intemperate critic, De Voto was especially intolerant of mediocrity in literature and all types of social pretense. His volumes on Mark Twain include *Mark Twain's America* (1932), *Mark Twain at Work* (1941) and *Mark Twain in Eruption* (1940).

Dingell, John David, U.S. congressman (b. Detroit, Mich., Feb. 2, 1894—d. Washington, D.C., Sept. 19, 1955).

Dinneen, William Henry (Bill), U.S. baseball player and umpire (b. Syracuse, N.Y., April 25, 1876—d. Syracuse, N.Y., Jan. 13, 1955).

Dirksen, Herbert von, German diplomat (b. Berlin, Ger., April 2, 1882—d. Munich, Ger., Dec. 19, 1955).

Donnelley, Thomas Elliot, U.S. printing executive (b. Chicago, Ill., Aug. 18, 1867—d. Lake Forest, Ill., Feb. 6, 1955).

Dowling, John Graham, U.S. foreign correspondent (b. Philadelphia, Pa., March 5, 1914?—d. Cuatro Mojones, Par., June 16, 1955).

Downes, (Edwin) Olin, U.S. music critic (b. Evanston, Ill., Jan. 27, 1886—d. New York, N.Y., Aug. 22, 1955), studied piano, music analysis and harmony as a youth, and then taught piano. From 1906 to 1924 he was music critic of the *Boston Post* and from 1924 until his death music critic of the *New York Times*, where he came to be regarded generally as the dean of his profession. Widely known also as a lecturer, he was the author of *The Lure of Music* (1918) and *Symphonic Masterpieces* (1932), editor of *Songs of Russia* and co-editor of *A Treasury of American Song*.

du Cros, Sir Arthur Philip, British politician and business executive (b. Dublin, Ire., Jan. 26, 1871—d. Oxley, Herts., Eng., Oct. 28, 1955).

Dudley, Albertus True, U.S. educator and author (b. Paris, N.Y., Jan. 19, 1881—d. Exeter, N.H., Feb. 11, 1955).

Duff, The Rt. Hon. Sir Lyman Poore, Canadian jurist (b. Meaford, Ont., Jan. 1865—d. Ottawa, Can., April 26, 1955).

Dunbabin, Thomas James, British archaeologist (b. Australia, 1911—d. Clarendon, Eng., March 31, 1955).

Dunbar, Sir Alexander, British steel industrialist (b. Glasgow, Scot., Sept. 2, 1888—d. Sheffield, Eng., Oct. 14, 1955).

Dunn, Robert (Steed), U.S. journalist and explorer (b. Newport, R.I., Aug. 1, 1877—d. Katonah, N.Y., Dec. 24, 1955).

Dunyevsky, Isaak O., Soviet composer (b. Lokhvitsy, U.S.S.R., Jan. 30, 1900—d. Moscow, U.S.S.R., July 25, 1955).

Durkin, Martin Patrick, U.S. labour leader and cabinet member (b. Chicago, Ill., March 18, 1894—d. Washington, D.C., Nov. 13, 1955), served less than nine months as secretary of labour under Pres. Dwight D. Eisenhower. He resigned Sept. 10, 1953, charging that the administration had failed to carry out an agreement to sponsor amendments to the Taft-Hartley labour law that he had considered inimical to the interests of U.S. labour. Durkin's resignation marked the start of strained relations between the Eisenhower administration and the American Federation of Labor and the Congress of Industrial Organizations.

The son of Irish immigrants, Durkin left school at 14 to become a steamfitter apprentice in Chicago. After military service in France during World War I he became interested in labour organization and was appointed business manager of a steamfitters local at Chicago in 1921. From 1933 to 1939 he was Illinois state director of labour. In the latter year he was named secretary-treasurer of the United Association of Journeymen Plumbers & Steamfitters, a member union of the A.F. of L.; and he was elected president of the union in 1943. After resignation as U.S. secretary of labour Durkin returned to his union office.

Easton, Florence Gertrude (Mrs. Stanley Rogers), U.S. concert singer (b. Middlesbrough-on-Tees, Eng., Oct. 25, 1884—d. New York, N.Y., Aug. 1, 1955).

Edson, Merritt Austin, U.S. marine corps officer (b. Rutland, Vt., April 1, 1897—d. Washington, D.C., Aug. 14, 1955), left his studies at the University of Vermont, Burlington, to join the marine corps after U.S. entrance in World War I. He received his wings as a naval aviator in 1922 and in 1929 served with distinction in Nicaragua. In World War II he acquired fame as a commander of a marine battalion known as "Edson's Raiders" during the Tulagi-Guadalcanal campaigns of 1942, following which he received the congressional medal of honour. Edson also participated in the attacks on Tarawa, Saipan and Tinian, and in the final months of World War II he commanded the service command of the Pacific fleet marine force. He was promoted to brigadier general in 1943 and retired from the marine corps as major general in 1947. Later he was head of the Vermont state police and executive director of the National Rifle association. Shortly before his death, apparently of suicide, he had worked on the new code of conduct for U.S. prisoners of war, promulgated Aug. 17, 1955.

Eggen, Arne, Norwegian composer (b. Trondheim, Nor., Aug. 28, 1881—d. Oslo, Nor., Oct. 26, 1955).

Egloff, Gustav, U.S. scientist (b. New York, N.Y., Nov. 10, 1886—d. Chicago, Ill., April 29, 1955), was one of the foremost petroleum chemists of his time. He graduated from Cornell university, Ithaca, N.Y., in 1912, and took master's degree and Ph.D. at Columbia university, New York city. He was research director from 1917 of Universal Oil Products company, Plaines, Ill., he was given world-wide recognition as an authority on

chemistry of petroleum and received a number of international awards and other honours for his research and discoveries.

Einstein, Albert, German-Swiss-U.S. mathematician and physicist and Nobel prize winner (b. Ulm, Ger., March 14, 1879—d. Princeton, N.J., April 18, 1955), was best known for his principle of relativity. The son of a German Jewish industrialist, he attended school at Aarau, Switz., and later the polytechnic school at Zürich (where he also taught physics and mathematics) and the University of Zürich, where he received his Ph.D. degree. While studying for his doctorate and working in the Swiss patent office at Berne, Einstein in 1905 published his first restricted principle of relativity. At the time there seemed to be no way to test such matters experimentally and Einstein's restricted principle of relativity failed to obtain much acceptance at first except by some theoretical scholars in Germany. Ten years later Einstein announced his general theory of relativity, a broad and highly technical generalization of his special theory. It turned out that certain astronomical implications might be tested observationally, and serious consideration was finally accorded to Einstein's theory. There was one very important implication from the theory of relativity—that the two forms of universal energy most readily available for human measurement, that contained in matter itself and that of all types of radiation, were in a sense equivalent: the energy E (ergs), locked up in matter, being equal to its mass, or inertia, M , multiplied by the square of that uniform and ultimate velocity c , which radiation alone can possess

$$E=mc^2.$$

It took a Rutherford and his colleagues first to verify the mass-energy relation of Einstein in a few individual cases where individual atomic particles could be observed, then a James Chadwick to discover the neutron, then an Enrico Fermi to utilize it in transmuted about half the elements of the periodic table, then an Otto Hahn, a Lise Meitner and an Otto Frisch to recognize the fissionable capacity of a certain uranium isotope and finally a Fermi again to design, build and set going the first controlled nuclear reactor before the Einstein law was abundantly verified.

From about 1916 Einstein spent most of his energies setting up an all-inclusive explanation of the energy in all scientific phenomena—including those of electric, magnetic and gravitational fields of force—in a unified field theory. This theory, however, failed to find support among leading physicists when it was published in 1953, and Einstein himself expressed his disappointment in not finding any possible kind of experimental test of its validity. Meanwhile Einstein engaged in other scientific research which led to his recognition as one of the greatest thinkers of modern times. Notable were his extensions of Max Planck's quantum theory, his explanation of the Brownian movement and his discovery of the law of photoelectric effect—one basis of modern electronics. For the latter he received the 1921 Nobel prize in physics. Einstein, who had become a Swiss citizen as a youth, returned to his native Germany in 1913 to become director of the Kaiser Wilhelm Physical Institute. In 1932 he was offered a staff position at the Institute for Advanced Study, Princeton, N.J. He did not accept at once but sailed for the U.S. later that year after it had become evident that Adolf Hitler was about to come to power in Berlin. After returning briefly to Belgium, he settled permanently at Princeton as a lifetime member of the staff of the Institute for Advanced Study in 1933. He became a U.S. citizen in 1940.

In his famous letter to Pres. Franklin D. Roosevelt dated Aug. 2, 1939, Einstein called attention to the clear possibility of constructing a new and "extremely powerful" weapon—the atomic bomb. Roosevelt promptly investigated and set the Manhattan project in motion. A somewhat ironic aspect of this prelude to the atomic age was that Einstein had been a confirmed pacifist who as a German citizen had publicly opposed Germany's invasion of Belgium at the start of World War I. In the United States Einstein periodically expressed his views on social justice, and he was a fervent Zionist. Throughout his adult life he was an exponent of socialism, world government with certain restrictions and total disarmament. Einstein died on April 18, 1955, at his home in Princeton, N.J., and was cremated at Trenton, N.J., the same day.

Enesco, Georges, Rumanian violinist and composer (b. Dorohoi, Rum., Aug. 9, 1881—d. Paris, Fr., May 4, 1955), was well known as a virtuoso violinist for his interpretations of Bach, especially the Brandenburg concertos and the D minor double violin concerto, of which he made a notable recording with his pupil Yehudi Menuhin. As an executant he was in the French classical tradition, he went to Paris in 1893 and studied under Massenet and Fauré, but as a composer he retained elements of Rumanian romanticism and his *Rumanian Rhapsody* for orchestra and the opera *Oedipe* (produced, 1936) draw their strength from folk music.

Strand, Stuart David, U.S. novelist (b. Chicago, Ill., March 13, 1905—d. Los Angeles, Calif., Sept. 9, 1955).

Tagle y Tagle, Concha, Spanish author (b. Santander, Castille, Sp., April 15, 1880—d. Madrid, Sp., May 19, 1955).

Tins, Silliman, U.S. publisher and political leader (b. Joshua, Tex., April 2, 1894—d. Fort Worth, Tex., June 25, 1955), began his journalistic career as a reporter in 1913, later becoming Washington correspondent for the *Fort Worth Star-Telegram*. He also was interested in commercial aviation and politics, becoming an officer and director of American Airlines and its predecessor company, American Airways, Inc., and shepherding the switch of John N. Garner's votes to Franklin D. Roosevelt at the 1932 Democratic national convention in Chicago, Ill. In later years, after he had bought the *Nashville Tennessean* (Tenn.), he was the political mentor of Sen. Estes Kefauver of Tennessee, spearheading the latter's unsuccessful effort to get the Democratic presidential nomination at Chicago in 1952. For several years Evans was also publisher of the *Chicago Sun*, retiring from that position in 1944.

Tore, Emile, French playwright (b. Metz, Fr., March 24, 1869—d. Paris, Fr., Sept. 25, 1955), the son of a stage manager, was administrator of the Comédie Française from 1915 to 1936. In 1894, continuing the pursuit of writing and producing he had begun at the age of 13, he staged *Comme ils sont tous*, his first success, and thereafter a series of political and social satires: *L'Argent* (1895); *La vie publique* (honoured by the Académie Française); *Les ventres dorés* (1905) and *Les sauterelles* (1911) which attacked colonial administra-

tion. Other plays included a series of family tragedies and adaptations of two Balzac novels. During this time at the Comédie Française he devoted all his energies to the successful development of the institution with not only classical but also carefully chosen contemporary repertory. He was made a commander of the Legion of Honour.

Farjeon, Joseph Jefferson, British author (b. London, Eng., June 4, 1883—d. Hove, Eng., June 6, 1955).

Fermoy, Edmund Maurice Burke-Roche, 4TH BARON OF, British soldier and politician (b. May 15, 1885—d. King's Lynn, Eng., July 8, 1955).

Field, Guy Cromwell, British educator (b. Birmingham, Eng., Jan. 15, 1887—d. Bristol, Eng., April 28, 1955).

Finnegan, Richard James, U.S. editor (b. Chicago, Ill., Sept. 5, 1884—d. Evanston, Ill., May 6, 1955).

Fishburn, Junius Blair, U.S. publisher (b. Boone Mill, Va., Sept. 27, 1865—d. Roanoke, Va., April 1, 1955).

Fisher, Hammon Edward ("Ham"), U.S. cartoonist (b. Wilkes-Barre, Pa., 1900?—d. New York, N.Y., Dec. 27, 1955), created in 1930 the famous newspaper comic strip "Joe Palooka," read daily by an estimated 50,000,000 people. The strip had as its principal character an amiable prize fighter who became mythical heavyweight boxing champion of the world and retained his title throughout his creator's career. Joe Palooka was also the subject of books, motion pictures, radio programs and monthly comic books, and had a statue erected in his honour at Bedford, Ind. Fisher died an apparent suicide.

Fite, Warner, U.S. educator and author (b. Philadelphia, Pa., March 5, 1867—d. Philadelphia, June 23, 1955).

Flack, Joseph, U.S. diplomat (b. Grenoble, Pa., Dec. 5, 1894—d. at sea enroute to New York, N.Y., May 8, 1955).

Flannagan, John William Jr., U.S. congressman (b. Trevilians, Va., Feb. 20, 1885—d. Bristol, Va., April 27, 1955).

Fleming, Sir Alexander, British bacteriologist (b. Lochfield, near Darvel, Ayrshire, Scot., Aug. 6, 1881—d. London, March 11, 1955), was acclaimed as the introducer of a new era in the treatment of disease and his name linked with those of Pasteur, Lister and Hunter. He was the son of a farmer and went first to the village school and afterward to Kilmarnock academy. When he was 14 he moved to London to live with a brother who was studying medicine and continued his education at the Regent Street polytechnic. In 1902, encouraged by his brother and enabled to enter St. Mary's hospital medical school by a small legacy, his savings and the senior entrance scholarship in natural science, he embarked on what was to be an outstanding medical career. The year of his qualification, 1906, was significant also for his meeting with the bacteriologist Sir Almroth Wright, whose assistant he became and whom he succeeded as director of the Wright-Fleming institute. In 1919 he was made assistant director of the inoculation department at St. Mary's and in 1928 professor of bacteriology at London university. His dominant interest lay in investigating the human body's natural defenses and in 1922 he had discovered lysozyme, a naturally occurring antibiotic. In Sept. 1928, when examining an agar plate culture of staphylococci, he noticed that a mould had formed around which the staphylococci were disappearing: "I found that the mould made a powerful and nonpoisonous antiseptic which I christened penicillin." Although Fleming discovered it and realized its implications, he was not immediately concerned with penicillin as an internal therapeutic agent, and it was Howard Florey and Ernest Chain (awarded the Nobel prize for medicine in 1945 jointly with Fleming) who purified and developed it therapeutically. Sir Alexander Fleming was knighted in 1944.

Fleming, Philip Bracken, U.S. army officer and government official (b. Burlington, Iowa, Oct. 15, 1887—d. Washington, D.C., Oct. 6, 1955).

Flugel, John Carl, British psychologist (b. June 13, 1884—d. London, Eng., Aug. 6, 1955).

Fox, Howard Francis, U.S. baseball player (b. Coburg, Ore., March 1, 1921—d. San Antonio, Tex., Oct. 9, 1955).

Francis, Robert Charles, U.S. motion picture actor (b. Glendale, Calif., Feb. 26, 1930—d. Burbank, Calif., July 31, 1955).

Friganza, Trixie (DELIA O'CALLAHAN), U.S. actress in vaudeville and musical revues (b. Grenola, Kan., Nov. 29, 1870—d. Flintridge, Calif., Feb. 27, 1955), made her stage debut in 1889 and had her first starring part five years later, in *A Christmas Night*. Later "hits" of hers included *Sally in Our Alley*, *The Girl from Paris* and *The Sweetest Girl in Paris*. She also played leading roles in a number of motion pictures, among them *The Road to Yesterday*, *Free and Easy* and *Myri and Marge*. She retired in 1939, except for occasional appearances in U.S. veterans' hospitals.

Fry, Clements Collard, U.S. psychiatrist (b. Jersey City, N.J., Nov. 15, 1892—d. Wallingford, Conn., Nov. 24, 1955).

Gaither, Frances Jones (MRS. RICE GAITHER), U.S. novelist (b. Somerville, Tenn., May 21, 1889—d. Rockledge, Fla., Oct. 28, 1955).

Gallagher, Richard S. ("Skeets"), U.S. comedian (b. Terre Haute, Ind., July 28, 1900—d. Santa Monica, Calif., May 22, 1955), forsook the study of law at Indiana university, Bloomington, for a career in vaudeville. He made his first Broadway appearance in the early 1920s in *Up in the Clouds*. His later starring roles included a number of musical comedies, such as *No, No, Nanette*, *Rose Marie* and *Lucky*. In 1927 he played a part in his first motion picture, *The Potlers*, starring W. C. Fields. During the next 12 years he appeared in a number of other films, notably *Idiot's Delight* with Norma Shearer in 1939. Gallagher starred in the stage play *Good Night Ladies* which set an all-time Chicago record of 100 weeks in that city in 1942-44. He retired from the stage in 1951.

Garbett, Cyril Forster, primate of England (b. Tongham, Surrey, Eng., Feb. 6, 1875—d. Bishopthorpe, York, Eng., Dec. 31, 1955), the son of a country vicar, was educated at Portsmouth grammar school, at Keble college, Oxford and at Cuddesdon theological college, from which he was ordained in 1900. His experience first as one of a team of curates (1900-09) and later as vicar in a large parish in Portsea developed his gifts as pastor and adminis-

trator and in 1919 he was appointed bishop of Southwark. He became an expert on housing and nutrition, launched a successful Twenty-Five Churches fund and undertook a notable series of pilgrimages on foot into his rural parishes which he continued after his translation to Winchester in 1932. While there he organized the 1935 Church congress at Bournemouth, was chairman of the Church assembly's missionary council, and served on various national committees on town and country planning, rural housing and on the Religious Advisory committee of the B.B.C. As unofficial ambassador of the Anglican communion, he visited Moscow in 1943, the U.S. in 1944, the Netherlands, Italy and Greece in 1945, the middle east in 1946, Czechoslovakia and Yugoslavia in 1947 and Australia and the far east in 1951-52. The vigour of his pronouncements on such varied problems as divorce, Communism, the hydrogen bomb and the dogma of the Assumption was unabated. In 1947 he published *The Claims of the Church of England*, the first of a trilogy completed by *Church and State in England* (1950) and *In an Age of Revolution* (1952). His last book, *World Problems Today*, appeared in 1955.

Gasser, Lorenzo Dow, U.S. army officer (b. Lykins, O., May 3, 1876—d. Washington, D.C., Oct. 29, 1955).
Gearhart, Bertrand Wesley, U.S. politician (b. Fresno, Calif., May 31, 1890—d. San Francisco, Calif., Oct. 11, 1955).
Gessler, Otto Karl, German statesman (b. Ludwigsburg, Ger., Feb. 6, 1875—d. Lindenburg, Ger., March 24, 1955).

Ghavam (Qavam) es-Saltaneh, Ahmed, Iranian politician (b. Persian Azerbaijan, 1882—d. Tehran, Iran, July 23, 1955), entered the court of the shah as a scribe in 1898. He rose to the position of minister of justice in 1909 and became minister of the interior in the following year. In 1918 he was appointed governor of Khurasan province and three years later was nominated prime minister. He was in office from 1921 to 1922 and again from 1922 to 1923 when he was accused of plotting against the shah's life and was exiled until 1928. He was again prime minister in 1942, but resigned in 1943 following the Tehran bread riots. Restored to office in Jan. 1946, he was successful in bringing about the withdrawal of Soviet troops from Iran Azerbaijan (with its Soviet-sponsored regime) and setting up a Soviet-Persian oil company, but the agreement concerning the latter aroused the opposition of the *majlis* and he failed to win their vote of confidence. He thereupon left Iran in 1947, but returned home to become prime minister for the fourth time in July 1952. His ministry was short-lived, however, for the shah had deprived him of the military forces necessary to quell the riots which had broken out in the capital, so that Ghavam's resignation after four days was inevitable. He was arrested and an order was made for the confiscation of his property. He was not brought to trial, however, and in 1954 the order of confiscation was rescinded.

Gil, Martin, Argentine astronomer and author (b. Córdoba, Arg., Oct. 23, 1868—d. Buenos Aires, Arg., Dec. 9, 1955).
Gill, Basil, British actor (b. Birkenhead, Eng., March 10, 1877—d. Hove, Eng., April 23, 1955).
Glasgow, Sir (Thomas) William, Australian army officer and politician (b. Tiaro, Queens., June 6, 1876—d. Brisbane, Austr., July 4, 1955).
Glass, Carter Jr., U.S. publisher (b. Lynchburg, Va., March 29, 1893—d. Lynchburg, Dec. 1, 1955).

Goddard, Calvin Hooker, U.S. army officer and criminologist (b. Baltimore, Md., Oct. 30, 1891—d. Washington, D.C., Feb. 22, 1955), graduated from Johns Hopkins university, Baltimore, in 1911, and took his medical degree from the same institution four years later. He served as a medical officer with the U.S. army in Europe during World War I. Shortly thereafter he became interested in firearms identification and he originated the branch of criminology known technically as forensic ballistics (scientific linking of weapons with bullets or cartridges fired from them). Goddard was director of the Northwestern University Scientific Crime Detection laboratory (later transferred to administration of the city of Chicago) from 1929 to 1933. During World War II he served again as an army officer and after that war he founded a crime detection laboratory for the U.S. army occupation forces in Tokyo, Jap., advancing to the rank of colonel. During the latter part of his career he was military editor of *Encyclopedia Britannica* and an editorial adviser for a 40-volume history of medicine during World War II.

Golden, John, U.S. theatrical producer, actor, playwright and songwriter (b. New York, N.Y., June 27, 1874—d. New York, N.Y., June 17, 1955), at various times in his youth studied architecture, music and law, but always returned to the theatre. He wrote verses, plays and songs, and composed the music for a number of musical comedies, collaborating also with Oscar Hammerstein, Irving Berlin and others; among his most successful popular songs were "Goodbye Girls, I'm Through" and "Poor Butterfly." Probably best known as a producer, however, Golden produced or co-produced more than 100 plays in New York city, including *Lightnin'*, which established a new Broadway record of 1,291 consecutive performances after its opening in 1918. *Three Wise Fools*, *Susan and God*, *Claudia*, *The Male Animal*, etc. He was also the author of several short plays.

Gooden, Stephen, British engraver (b. 1892—d. Chesham Bois, Eng., Sept. 21, 1955).

1955 OBITUARIES: Clark C. Griffith, U.S. baseball executive; Walter Hampden, U.S. actor; Cordell Hull, U.S. statesman; Robert R. McCormick, U.S. publisher; Bernarr Macfadden, U.S. physical culturist

Goodhart, Albert S., U.S. song writer (b. New York, N.Y., Jan. 26, 1905—d. New York, Nov. 30, 1955).

Gorton, Neville Vincent, British bishop of Coventry (b. Manchester, Eng. 1888—d. London, Eng., Nov. 30, 1955).

Govorov, Leonid Aleksandrovich, Russian army officer (b. St. Petersburg [Leningrad], U.S.S.R., 1896—d. Moscow, March 19, 1955), commanded the artillery which broke the Mannerheim line during the Soviet-Finnish War of 1939-40. When Germany attacked the U.S.S.R. he was a lieutenant general. In 1942 he was given command of the Leningrad front and on Jan. 27, 1944, he succeeded in routing the German besiegers and entered Estonia. On June 10 he launched for the second time a drive through the Karelian isthmus, culminating in the Soviet-Finnish armistice of Sept. 1944. He had been promoted marshal of the Soviet Union on June 18, 1944. After World War II Govorov was a deputy minister of defense, an alternate member of the central committee of the Communist party and a member of the supreme soviet.

Gray, Carl Raymond, Jr., U.S. business executive and government official (b. Wichita, Kan., April 14, 1889—d. St. Paul, Minn., Dec. 2, 1955), was head of the Veterans administration from 1948 until his resignation in 1953 because of ill health. Graduating from the University of Illinois, Urbana, in 1911, he later held a number of railroad and banking executive positions. During World War II he was a general officer in charge of all military railway transportation in the European theatre of operations. After his return to civilian life in 1946 Gray was executive vice-president of the Chicago and North Western railroad, until his appointment as VA administrator by Pres. Harry S. Truman.

Graziani, Rodolfo, Italian army officer (b. Filetino, near Frosinone, I., Aug. 11, 1882—d. Rome, Jan. 11, 1955), was commissioned in 1908 and was sent to Eritrea. Sent as captain to the Austrian front in 1915, he was colonel at 36. His ruthlessness and brilliance as a commander against native forces were shown during 1921-30, when he undertook the subjection of revolted territories in Tripolitania and Cyrenaica; his maxim that "the enemy forgiven is more dangerous than 1,000 foes" was exemplified against the Senussi, whom he subdued by concentration camps, by "flying tribunals" which executed rebels in the villages and by the filling in of wells. Commander of the Libyan forces, 1930-34, he became governor and commander in chief in Italian Somaliland in 1935 and as leader of the southern campaign, played a notable part in the conquest of Ethiopia. For his victory against Harar he was made marshal and marquis of Neghelli. As viceroy, 1936-38, he consolidated the victory by such measures as the execution of 1,600 natives after an attack on his life (1937). In Nov. 1939 he became chief of staff of the Italian army and commander of the army of the Po and in July 1940 he succeeded Gen. Italo Balbo as governor general of Libya and commander of Italian troops in Africa. Failure to integrate his forces and timidity in attack led to his defeat by General Wavell, and in March 1941 he was relieved of his command. In Sept. 1943 he emerged from disgrace to become minister of defense in Mussolini's Republican Fascist government in north Italy, but failed to organize an army and in April 1945 was captured by the Allies. In 1948 he was sentenced by an Italian tribunal, but released under amnesty after three months' imprisonment and later became president of the neo-Fascist Italian Socialist movement.

Greene, Josiah E., U.S. novelist (b. Duluth, Minn., March 22, 1911—d. Duluth, June 12, 1955).

Greenstone, Rev. Julius Hillel, U.S. educator and author (b. Russia, April 1873—d. Philadelphia, Pa., March 7, 1955).

Greenwood, Ernest, U.S. legislator (b. Yorkshire, Eng., Nov. 25, 1884—d. Bayside, N.Y., June 15, 1955).

Griffith, Clark C., U.S. baseball player and executive (b. near Nevada, Mo., Nov. 20, 1869—d. Washington, D.C., Oct. 27, 1955), was known as the "fox" of baseball because of the shrewd trades of baseball players he made as manager and later owner of the Washington, D.C., Senators in the American League. He began his professional baseball career at the age of 18 as pitcher for the Bloomington, Ill. club, continuing in the minor leagues (American association, Pacific coast and Rocky mountain leagues) until 1893, when he joined the old Chicago Colts, managed by Adrian C. "Pop" Anson. In 1901 he joined the Chicago White Sox as pitcher-manager and led that team to its first league pennant. There he also helped organize the new American league. In 1903 he organized the New York Highlanders, predecessor team of the Yankees, and from 1909 to 1911 he was manager of the Cincinnati Reds in the National league. He then went to Washington as manager of the Senators, later (1919) becoming co-owner of that team. Griffith was elected to baseball's hall of fame in 1946.

Grossley, Richard Sylvester, U.S. educator (b. Gloster, Miss., July 11, 1883—d. New York, N.Y., Nov. 17, 1955).

Gulbenkian, Calouste Sarkis, British financier and industrialist (b. Scutari, Istanbul, Tur., Mar. 24, 1869—d. Lisbon, Port., July 20, 1955), came of an Armenian merchant family, who sent him for education to Marseilles at 16, to London where he graduated at King's college in engineering and applied sciences. In 1895 he began his association with British oil leaders and first employed his talent for complex manipulation in the organization of the Royal Dutch Shell group. In 1902 he became a British subject. Already adviser to the Turkish embassies in London and Paris, he was appointed in 1910 director of the National Bank of Turkey and in 1912

quired in the newly negotiated Turkish Petroleum company a 15% holding which, to admit the rival Anglo-Persian company in 1913-14, he voluntarily reduced to 5%, but henceforth never relinquished, earning the nickname "Mr. 5%." Heavy losses during World War I were recuperated by a successful claim to the Northern Iraq oil concessions and former German interests in the renamed Iraq Petroleum company were, at his instigation, ceded to France, whose refining industry benefited from his wartime collaboration with the government. On his advice the company manoeuvred to include rather than oppose U.S. interests, but their independent prospecting in Saudi Arabia after World War II was lengthily contested by Gulbenkian. From 1942 he led a solitary life in Portugal. He amassed private collections unrivalled in scale, reflecting an independent and eclectic taste in and knowledge of sculpture, ceramics, furnishings, jewellery, coins and, predominantly, painting. He was a devout member of the Armenian church, being particularly solicitous for the patriarchate of Jerusalem where, in 1930, he founded the Gulbenkian library. By his will he established in Lisbon the Gulbenkian foundation to administer his vast fortune and art collections for charitable, artistic, educational and scientific purposes on a specifically international basis, and to continue his lifelong but unpublicized philanthropic work.

Gumpert, Martin, U.S. physician (b. Berlin, Ger., Nov. 13, 1897—d. New York, N.Y., April 18, 1955).

Hale, William Jay, U.S. organic chemist (b. Ada, O., Jan. 5, 1876—d. Midland, Mich., Aug. 8, 1955).

Halford, Frank Bernard, British aircraft engine designer (b. Nottingham, Eng., March 7, 1894—d. Northwood, Middlesex, April 17, 1955), was educated at Felsted school and at Nottingham university. During World War I he served in the R.F.C. and the R.A.F. For a short time before this he had been an engine examiner in the aeronautical inspection department of the air ministry. In 1915 he was recalled from France to design an engine larger than the Austro-Daimler. This 230-h.p. Beardmore-Halford-Pullinger (B.H.P.) was used in the D.H. 4 aircraft and later in the D.H. 9. Subsequently Halford joined H. R. Ricardo in work on the Ricardo supercharger and introduced an inverted in-line engine. He then worked independently on the development of small high-rotational-speed engines for motorcycles and racing cars, but in 1924 he began an association with A.D.C. Aircraft Ltd., and designed the Cirrus, Airdisco, Napier and Nimbus engines. In 1927 he joined de Havilland's and designed the Gipsy engine, which he continued to develop for a number of years. At the same time he worked on the 305-h.p. Rapier, employing a double crankshaft, for the Napier company. During World War II he concentrated on jet engines, producing the Napier Sabre and Dagger, and the de Havilland Goblin and Ghost engines. In 1953 it was announced that Halford and his assistants had produced the axial-flow gas turbine Gyron, still secret at the time of his death. From 1935 to 1944, when the de Havilland Engine company was formed under his direction, Halford had been technical director of Napier's. He was also a director of the de Havilland Aircraft company from 1945. He was president of the Royal Aeronautical society for 1951-52.

Hammerstein, Arthur, U.S. producer (b. New York, N.Y., 1876—d. Palm Beach, Fla., Oct. 12, 1955).

Hampden, Walter (WALTER HAMPDEN DOUGHERTY), U.S. actor (b. Brooklyn, N.Y., June 30, 1879—d. Hollywood, Calif., June 11, 1955), graduated from Brooklyn Polytechnic institute in 1900 and shortly thereafter joined a Shakespearean troupe of actors in England. His first notable success was as a substitute Hamlet in 1905. Returning in 1907 to the United States, he made his first Broadway appearance with Mme. Alla Nazimova. Subsequently he starred in a number of Shakespearean parts and in 1923-24 made a great hit as Cyrano in Edmond Rostand's *Cyrano de Bergerac*. In 1925 he leased the old Colonial theatre in New York city, renamed it Hampden's, and there starred in plays by Sir James Barrie, Henrik Ibsen and other modern dramatists, in addition to his well-known Shakespearean roles. He played Cyrano more than 1,000 times after his original revival of it in 1923. Hampden also starred in many radio, television and motion-picture productions. His last stage appearance was in 1953 on Broadway.

Hansen, Martin A., Danish author (b. Strobj Sogn, Stevns, Den., Aug. 20, 1909—d. Copenhagen, Den., June 28, 1955).

Harger, Charles Moreau, U.S. editor (b. Phelps, N.Y., Jan. 23, 1863—d. Abilene, Kans., April 3, 1955).

Harris, Henry Wilson, British journalist and politician (b. Plymouth, Eng., Sept. 21, 1883—d. Hove, Eng., Jan. 11, 1955).

Harrison, Earl Grant, U.S. lawyer and educator (b. Philadelphia, Pa., April 27, 1899—d. near Sabel, N.Y., July 28, 1955).

Hartman, Grace (MRS. NORMAN ABBOTT), U.S. dancer (b. San Francisco, Calif., 1907—d. Van Nuys, Calif., Aug. 8, 1955).

Hartman, Rev. Dr. Lewis Oliver, U.S. Methodist clergyman and editor (b. La Grange, Ind., May 3, 1876—d. Newton, Mass., June 30, 1955).

Harvey, Thomas Edmund, British historian and social reformer (b. Leeds, Eng., Jan. 4, 1875—d. Leeds, May 3, 1955).

Hathway, Marion (MRS. THEODORE R. PARKER), U.S. educator (b. North Tonawanda, N.Y., July 31, 1895—d. Bryn Mawr, Pa., Nov. 18, 1955).

Hayden, Josiah Willard, U.S. philanthropist (b. Boston, Mass., May 2, 1874—d. Arlington, Mass., June 15, 1955).

Hayes, Edward Arthur, U.S. politician (b. Morrisonville, Ill., Jan. 5, 1893—d. Chicago, Ill., April 1, 1955).

Hayes, Frank Witman, U.S. baseball player (b. Jamesburg, N.J., Oct. 13, 1915—d. Point Pleasant, N.J., June 22, 1955).

Hayes, Ira, U.S. marine (b. 1922?—d. near Bapchule, Ariz., Jan. 24, 1955), was one of the six marines who raised the U.S. flag atop Mt. Suribachi, Iwo Jima, in Feb. 1945 during the marines' bloody conquest of that island from the Japanese in World War II. The flag-raising was made historic through a photograph taken by Joe Rosenthal of the Associated Press and was the subject of the heroic bronze memorial dedicated in Arlington, Va., Nov. 10, 1954.

Hayes, a Pima Indian, was buried in Arlington national cemetery near the monument. His death, the result of alcoholism and overexposure

on the Sacaton Indian reservation in Arizona, left only two survivors of the original flag-raising ceremony.

Hedtoft, Hans Christian, Danish statesman (b. Aarhus, Jutland, April 21, 1903—d. Stockholm, Swed., Jan. 29, 1955), began his career at 14 as a lithographer. Deeply interested in political and social affairs, he became a member of the National Social Democratic Youth organization and its president in 1928. As secretary of the Social Democratic party he was elected to the Folketing (lower house) in 1935, but was forced to resign (1941) after the German invasion of 1940. He took an active part, however, in the resistance movement and returned as minister of labour and social affairs in 1945. He was prime minister from 1947 to 1950 and again from 1953. An advocate of a strong national defense and Scandinavian unity, he promoted the Nordic council (at which he was representing Denmark at the time of his death) and urged Denmark's admission to the North Atlantic Treaty organization.

Hempel, Frieda, German-U.S. singer (b. Leipzig, Ger., June 26, 1885—d. Berlin, Ger., Oct. 7, 1955), studied at the Leipzig music conservatory. She made her debut at the Berlin royal opera in 1905 and first appeared at the Metropolitan opera in New York city in 1912. She became a U.S. citizen in 1918. Among her better known starring soprano roles were those in *Die Meistersinger*, *La Traviata*, *The Barber of Seville*, *Rigoletto* and *Der Rosenkavalier*. From 1919, when she left the Metropolitan, until her retirement in 1949, she appeared mostly in solo concert recitals.

Henderson, Daniel MacIntyre, U.S. novelist and editor (b. Baltimore, Md., May 27, 1880—d. Flemington, N.J., Nov. 12, 1955).

Hess, Julius Hays, U.S. pediatrician (b. Ottawa, Ill., Jan. 26, 1876—d. Los Angeles, Calif., Nov. 2, 1955).

Himstead, Ralph Elbner, U.S. editor and educator (b. Blue Mound, Ill., Jan. 31, 1893—d. Washington, D.C., June 9, 1955).

Hodiak, John, U.S. actor (b. Pittsburgh, Pa., April 16, 1914—d. Tarzana, Calif., Oct. 19, 1955), had his first major motion-picture role in *Lifeboat* (1944) with Tallulah Bankhead. His later starring roles were of many different types and included more than 20, such as *A Bell for Adano*, *Desert Fury*, *Homecoming*, *The Miniver Story* and *Trial*, the latter released a few days before his death. Hodiak also appeared in a number of stage productions, notably as Lieutenant Maryk in *The Caine Mutiny Court Martial* of Herman Wouk, and was starred in television plays.

Hofer, Karl Christian Ludwig, German painter (b. Karlsruhe, Ger., Oct. 11, 1878—d. Berlin, Ger., April 3, 1955).

Holder, Charles Adams, U.S. diplomat, physician and banker (b. New York, N.Y., Nov. 2, 1872—d. Boston, Mass., April 3, 1955).

Holding, Elisabeth Sanxay, U.S. author (b. Brooklyn, N.Y., June 8, 1889—d. New York, N.Y., Feb. 7, 1955).

Holt, Rev. Harold, U.S. Episcopal minister and educator (b. Cortland, N.Y., May 31, 1886—d. Elmhurst, Ill., May 28, 1955).

Holt, Rush Dew, U.S. politician (b. Weston, W.Va., June 19, 1905—d. Bethesda, Md., Feb. 8, 1955), was the youngest person ever elected to the U.S. senate. Educated at Salem college, Winston-Salem, N.C., from which he graduated in 1924, he taught school until his election to the West Virginia house of delegates, where he served from 1931 to 1935. In 1934 he was elected to the U.S. senate as a Democrat from West Virginia but was not seated until the following June 21, two days after he had reached the legal age for senators (30) provided by the U.S. constitution. In the senate he surprised his colleagues by becoming an enemy of the New Deal on almost all scores, domestic and foreign; he was a leading noninterventionist prior to World War II. Defeated for re-election in 1940, he later served several additional terms in the West Virginia house of delegates as both a Democrat and a Republican.

Honegger, Arthur, Swiss composer (b. Le Havre, Fr., March 10, 1892—d. Paris, Nov. 27, 1955), decided at the age of nine to become a composer. He studied at Zürich and at Paris conservatoire, where he was a pupil of André Gédalge, C.-M. Widor and Vincent d'Indy and a contemporary of Darius Milhaud and Francis Poulenc, with whom during World War I he formed the group known as "Les Six." Their impudent attitude to established forms influenced such early works as *Le Dit des jeux du monde* (1916) but by 1920, when he produced sonatas for viola and piano, cello and piano and unaccompanied violins and the *Pastorale d'été*, his natural vigour and austerity had asserted themselves. His later, strongly contrapuntal, style owed much to his acknowledged master, Bach. In 1921 appeared *Le Roi David*, originally written as incidental music to a play by René Morax, but later reorchestrated as an oratorio; in it he used massive choruses, strong rhythms and bold harmonies to create an impression of great tragic power. Other similar works included his incidental music for Jean Cocteau's *Antigone* (1922) and for Paul Claudel's *Jeanne d'Arc au bûcher* (1939); and the oratorio *Judith* (1925). His *Symphonie Liturgique* (1946), *Symphonie "di tre re"* (1950) and *Cantate de Noël* (1953) showed an equal seriousness and the "honest workmanship" which he once claimed as his ambition. More spectacular are three symphonic pieces of program music, *Pacific 231* (1924) which describes orchestrally the movement of an express train; *Rugby* (1928); and *No. 3* (1933). Honegger also wrote an operetta, *Le Roi Pausole* (1931); music for films and ballet; and many songs, as well as three other symphonies and much chamber music. (See also *Encyclopedia Britannica*.)

Hoover, Theodore Jesse, U.S. engineer and educator (b. West Branch, Iowa, Jan. 28, 1871—d. near Santa Cruz, Calif., Feb. 5, 1955).

Horder, Thomas Jeeves Horder, 1ST BARON, OF ASHFORD IN THE COUNTY OF SOUTHAMPTON, British physician (b. Shaftesbury, Eng., Jan. 7, 1871—d. Petersfield, Eng., Aug. 13, 1955).

Horovitz, Bela, Hungarian-born publisher (b. Budapest, Hung., April 18, 1898—d. New York, N.Y., March 7, 1955), founded the Phaidon press in Vienna in 1923. Having transferred the business to England in 1938, he introduced there the series of reasonably priced fine art books already notable for their large monochrome and colour plates and now furnished with an English text. The press also began publishing a catalogue of the

drawings in the Royal library, Windsor castle, of which 11 volumes had appeared by the time of Horovitz' death.

Hottes, Alfred Carl, U.S. educator and floriculturist (b. Ithaca, N.Y., March 16, 1891—d. La Jolla, Calif., Feb. 28, 1955).

Houston, Herbert Sherman, U.S. editor and publisher (b. Champaign, Ill., Nov. 23, 1866—d. New York, N.Y., May 15, 1955).

Howard, Shemp, U.S. comedian (b. Brooklyn, N.Y., March 17, 1900—d. Los Angeles, Calif., Nov. 22, 1955).

Howard (Black), Tom, U.S. actor (b. County Tyrone, Ire., June 16, 1885—d. Long Branch, N.J., Feb. 27, 1955), emigrated to the United States with his parents as an infant. He entered vaudeville in 1905, starring during the next few years as a comedian in burlesque. Later he was featured in a number of successful Broadway musical comedies, including *Smiles* (with Marilyn Miller), *The Gang's All Here* and *Greenwich Village Follies*. During World War II he entered radio, becoming nationally famous as the master of ceremonies of the quiz program "It Pays to Be Ignorant," subsequently also featured on television. Howard also made a number of short motion-picture comedies.

Howe, George, U.S. architect (b. Worcester, Mass., June 17, 1886—d. Philadelphia, Pa., April 16, 1955).

Hoyt, Julia (MRS. JULIA ROBBINS GILES), U.S. actress (d. New York, N.Y., Oct. 31, 1955).

Huerta, Adolfo de la, Mexican politician (b. Gaymas, Mex., 1881—d. Mexico City, Mex., July 9, 1955).

Hughes, Helen Sard, U.S. educator (b. Chicago, Ill., July 9, 1882—d. Boston, Mass., May 7, 1955).

Hulett, George Augustus, U.S. chemist (b. Ranch, Ill., July 15, 1867—d. Princeton, N.J., Sept. 6, 1955).

Hull, Cordell, U.S. statesman (b. Overton [later Pickett] county, Tenn., Oct. 2, 1871—d. Bethesda, Md., July 23, 1955), took his law degree from Cumberland university in 1891, was admitted to the Tennessee bar the same year, and in 1893 was elected to the Tennessee house of representatives. He was an infantry captain of volunteers in the Spanish-American war. From 1903 to 1907 he was judge of Tennessee's fifth judicial circuit and in the latter year was elected as a Democrat to the U.S. house of representatives from the 4th Tennessee district, serving except for the term 1921-23 until 1931 and specializing in income and inheritance tax and tariff legislation. He was elected U.S. senator from Tennessee in 1931 but resigned two years later to become secretary of state in Pres. Franklin D. Roosevelt's first cabinet. Hull meanwhile had been chairman of the Democratic national committee, from 1921 to 1924. As secretary of state until his resignation Nov. 27, 1944, because of failing health, Hull fought successfully for lower international tariffs, securing passage of the original U.S. reciprocal trade agreements act in March 1934. He also initiated the "good neighbour" policy of nonintervention in Latin-American internal affairs. As World War II drew near and ultimately engulfed the United States at Pearl Harbor, Hull worked to establish the "bipartisan" foreign policy of U.S. Democrats and Republicans. Toward the end of the war he took a prominent part in organizing the United Nations, particularly at the Dumbarton Oaks conference of 1944 at Washington, D.C. For this work he was awarded the Nobel peace prize of 1945. After his resignation from the Roosevelt cabinet Hull lived in semi-retirement in the nation's capital.

Hutchinson, Ely Champion, U.S. construction engineer and editor (b. San Francisco, Calif., Feb. 10, 1882—d. Washington, D.C., Nov. 12, 1955).

Innitzer, Theodor, Austrian Roman Catholic primate (b. Weipert [now Veprty], Bohemia, Dec. 25, 1875—d. Vienna, Oct. 9, 1955).

Inverforth, Andrew K. Weir, 1ST BARON OF, British industrialist (b. Kirk Cady, Scot., April 24, 1865—d. London, Eng., Sept. 17, 1955).

Isham, Ralph Heyward, U.S. manuscript collector (b. New York, N.Y., July 2, 1890—d. New York, N.Y., June 13, 1955), studied at Cornell and Yale universities, then travelled abroad. He joined the British army in 1916 and rose to the rank of colonel during World War I, being made a commander of the Order of the British Empire. In 1927 Isham bought a few of the private papers of James Boswell, later discovering and purchasing about 2,800 letters written to or by Samuel Johnson's biographer, in addition to about 1,300 manuscript pages of *The Life of Samuel Johnson*, many of them previously unpublished. The Isham collection was secured by Yale university in 1950 and, under the supervision and editorship of Professor Frederick A. Pottle of Yale, published in a series of books: *Boswell's London Journal* (1950), *Boswell in Holland* (1952), *Sir Joshua Reynolds' Portraits* (1952) and *Boswell on the Grand Tour* (1953 and 1955).

Jacks, Lawrence Pearsall, British theologian and philosopher (b. Nottingham, Eng., Oct. 9, 1860—d. Oxford, Feb. 17, 1955).

Jackson, Joseph Henry, U.S. literary critic and author (b. Madison, N.J., July 21, 1894—d. San Francisco, Calif., July 15, 1955), studied at Lafayette college, Easton, Pa., in 1915-17, and later served in World War I. In 1920 he joined the staff of *Sunset* magazine as associate editor and subsequently was managing editor and (1926-28) editor. From 1930 until his death he was book editor of the *San Francisco Chronicle*, establishing himself as an authority on U.S. far western culture. He also broadcast a Pacific coast network radio program, "Bookman's Guide," from 1924 into the early 1940s. Jackson was the author of a number of books dealing with true crime episodes and with far western historical topics. He received the Commonwealth club medal for his *Anybody's Gold* (published in 1941) and the Edgar Allan Poe award for his *Bad Company* (1949).

James, Lionel, British soldier and war correspondent (b. 1871—d. Berkshire, Eng., May 31, 1955).

James, Marquis, U.S. historian (b. Springfield, Mo., Aug. 29, 1891—d. Rye, N.Y., Nov. 19, 1955), was principally known as a biographer of historical U.S. personalities and corporations. His life of Sam Houston, *The Raven* (1929), won the 1930 Pulitzer prize for biography, and his two-volume life of Andrew Jackson (1937) was co-winner of the same prize in 1938. In addi-

tion, James wrote biographies of John N. Garner (1939) and Alfred du Pont (1941). As an industrial historian he wrote documentary accounts of several leading U.S. corporations, including the Texaco company and the Metropolitan Life Insurance company. James was educated in the public schools of Enid, Okla., and later was a reporter for several midwestern, southern and eastern dailies. From 1919 to 1923 he was national publicity director of the American Legion, after serving as an infantry officer with the American expeditionary forces during World War I. James was an original staff member of the *New Yorker* magazine.

Jansen, Harry A. ("Dante"), U.S. magician (b. Copenhagen, Den., 1883?—d. Northridge, Calif., June 16, 1955).

Jardine, William M., U.S. educator and cabinet officer (b. Oneida county, Ida., Jan. 16, 1879—d. San Antonio, Tex., Jan. 17, 1955), graduated from the Utah State Agricultural college at Logan in 1904, and later attended the University of Illinois. From 1904 to 1906 he taught at the Utah Agricultural college, after which he was for three years a field investigator for the U.S. department of agriculture. In 1910 he was named to the faculty of Kansas State College of Agriculture, Manhattan, serving later as president of that college from 1918 to 1925, when Pres. Calvin Coolidge appointed him U.S. secretary of agriculture. From 1930 to 1933 he was U.S. minister to Egypt. In 1934 he returned to private life as president of the Municipal University of Wichita, Kan., remaining in that office until his retirement in 1949.

Jarman, Pete, U.S. envoy and congressman (b. Greensboro, Ala., Oct. 31, 1892—d. Washington, D.C., Feb. 17, 1955).

Jensen, Elmer C., U.S. architect (b. Chicago, Ill., March 18, 1870—d. South Haven, Mich., April 24, 1955).

Jevons, (Herbert) Stanley, British economist (b. Oct. 8, 1875—d. London, Eng., June 28, 1955).

Johnson, Adelaide (MRS. ALEXANDER JENKINS JOHNSON), U.S. sculptress and suffragette (b. Plymouth, Ill., Sept. 26, 1847—d. Washington, D.C., Nov. 10, 1955).

Johnson, Allan Chester, U.S. educator (b. Loch Broom, N.S., Aug. 11, 1881—d. Princeton, N.J., March 2, 1955).

Johnson, James Price, U.S. pianist and composer (b. New Brunswick, N.J., Feb. 1, 1894—d. Jamaica, N.Y., Nov. 17, 1955).

Jones, Margo, U.S. theatrical producer (b. Livingston, Tex., Dec. 12, 1913—d. Dallas, Tex., July 24, 1955), graduated from Texas State College for Women, Denton, Tex., then studied at the Southwestern School of the Theatre at Dallas, Tex. She was later associated with various groups of community and university players and produced or co-produced several successful Broadway productions, including plays by Tennessee Williams, Herman Shumlin and Maxwell Anderson. Her own "theatre in the round," established at Dallas in 1945, became world famous.

Jones, Thomas H., British economist (b. Rhymney, Eng., 1870—d. London, Eng., Oct. 15, 1955).

Joseph, Mother Mary (MARY JOSEPHINE ROGERS), U.S. educator (b. Jamaica Plains, Mass.—d. New York, N.Y., Oct. 9, 1955).

Joyce, Alice, U.S. motion-picture actress (b. Kansas City, Mo., Oct. 1, 1890—d. Hollywood, Calif., Oct. 9, 1955), was one of the most famous actresses-beauties of the silent motion-picture era. She appeared in such pictures as *Stella Dallas* (1925), *Beau Geste* (1926), *13 Washington Square* (1929) and *The Green Goddess* (1930).

Károlyi, Count Michael, Hungarian politician (b. March 4, 1875—d. Vence, Fr., March 20, 1955).

Kasner, Edward, U.S. mathematician (b. New York, N.Y., April 2, 1878—d. New York, Jan. 7, 1955).

Keeling, Sir Hugh Trowbridge, British engineer (b. London, Eng., April 14, 1865—d. London, Feb. 3, 1955).

Keith, Sir Arthur, British anthropologist and surgeon (b. Old Machar, Aberdeen, Scot., Feb. 5, 1866—d. Downe, Kent, Jan. 7, 1955).

Kelley, Mrs. Camille McGee, U.S. judge (b. Trenton, Tenn.—d. Little Rock, Ark., Jan. 28, 1955).

Kelley, Michael Joseph, U.S. baseball player, manager and owner (b. Otter River, Mass., Dec. 2, 1876—d. Minneapolis, Minn., June 6, 1955).

Kemp, Alexander Nesbitt, U.S. financier (b. San Francisco, Calif., June 22, 1879—d. Los Angeles, Calif., Aug. 13, 1955).

Kennard, Sir Howard William, British diplomat (b. Brighton, Eng., March 23, 1878—d. Bath, Eng., Nov. 12, 1955).

Kimball, Fiske, U.S. museum director (b. Newton, Mass., Dec. 8, 1888—d. Munich, Ger., Aug. 14, 1955).

Kim Sung Soo, South Korean politician (b. Korea, 1891?—d. Seoul, Kor., Feb. 18, 1955).

Kirkwood, David Kirkwood, 1ST BARON OF BEARSDEN, British engineer and politician (b. Glasgow, Scot., July 8, 1872—d. Glasgow, April 16, 1955).

Kleberg, Richard Mifflin Sr., U.S. cattleman and congressman (b. Corpus Christi, Tex., Nov. 18, 1887—d. Hot Springs, Ark., May 8, 1955).

Kramer, Alexander Milton, U.S. composer (b. New York, N.Y., Sept. 13, 1893—d. New York, Aug. 25, 1955).

Kreger, Edward Albert, U.S. army officer and lawyer (b. near Keota, Iowa, May 31, 1868—d. San Antonio, Tex., May 24, 1955).

Kress, Samuel Henry, U.S. merchant, art collector and philanthropist (b. Cherryville, Pa., July 23, 1863—d. New York, N.Y., Sept. 22, 1955), taught school after graduating from high school, then bought his first store, at Natcoke, Pa., in 1887. One of the first to organize retail chains successfully, he acquired 12 "five-and-ten-cent" stores by 1900, with headquarters in New York city; by the time of his death S. H. Kress & Co. operated 26 retail outlets in the U.S. and Hawaii. Kress became one of the nation's leading philanthropists and art collectors, specializing in Italian masterpieces of painting and sculpture. In 1929 he established the Samuel H. Kress foundation, which made many notable gifts of art treasures to public institutions, including one to the National Gallery of Art at Washington, D.C., in 1939 valued at \$25,000,000. The foundation also made large cash donations for medical, educational and other purposes, including a gift of

\$8,000,000 to New York University-Bellevue Hospital Medical centre.

La Rue, Carl Downey, U.S. botanist (b. Williamsville, Ill., April 22, 1888—d. Ann Arbor, Mich., Aug. 19, 1955).

Latimer, Wendell Mitchell, U.S. chemist (b. Garnett, Kans., April 22, 1893—d. Oakland, Calif., July 6, 1955).

Leal, Newton Estillac, Brazilian politician (b. Rio de Janeiro, Braz., Oct. 6, 1893—d. Rio de Janeiro, May 1, 1955).

Legal, Ernst Otto Eduard, German actor and director (b. Halle, Ger., May 2, 1881—d. Berlin, Ger., June 29, 1955).

Léger, Fernand, French painter (b. Argentan, Normandy, Feb. 4, 1881—d. near Paris, Aug. 17, 1955), was the son of a prosperous cattle grazier. He went to Paris in 1898 and trained for a time as an architectural draftsman. As a painter he largely taught himself, but in 1901 he entered the École des Beaux Arts where he studied under Léon Gérôme and Gabriel Ferrier. An interest in geometry and mechanics predisposed him, however, to the art of Seurat and Cézanne and by 1911 he was exhibiting as a Cubist with Braque and Picasso. In the 1920s Léger started painting flat pattern, semi-cubist pictures in which the mechanical elements were partly derived from his experience as an artillery engineer in World War I. He illustrated many books and designed settings and costumes for ballets and films, notably for the Swedish ballet *La Création du Monde* (1922), and for Serge Lifar's *David triomphant* (1937). Léger's preference for concrete objects and interest in modern architecture, which led to his association with Le Corbusier and Amédée Ozenfant, found expression in his use of pure strong colours and curved planes to depict urban life on a monumental scale. Many of his later paintings were in the form of mural decorations. In 1940 Léger went to New York city where he stayed for five years, returning to France after the liberation. In 1950 a large exhibition of his paintings and drawings was held at the Tate gallery, London, and in 1953 his work was exhibited in the United States. There was a small retrospective exhibition of his work at the Marlborough gallery, London, in 1954.

Leigh, William Robinson, U.S. artist (b. Berkeley county, W.Va., Sept. 23, 1866—d. New York, N.Y., March 11, 1955).

Lentaigne, Walter David Alexander, British army officer (b. Burma, July 15, 1899—d. London, Eng., June 24, 1955).

Lewisohn, Ludwig, German-U.S. author and Zionist leader (b. Berlin, Ger., May 30, 1883—d. Miami, Fla., Dec. 31, 1955), emigrated to the United States as a child and was educated at the College of Charleston (S.C.). After several years of free-lance writing he taught German at the University of Wisconsin, Madison (1910–11), and was then professor of German at Ohio State university, Columbus (1911–19). He was drama editor, then associate editor of the *Nation* magazine from 1919 to 1924. Among Lewisohn's many works of fiction, history, biography and criticism, perhaps the best was a two-volume biography of Goethe, published in 1949. A lifelong Zionist, Lewisohn was editor of the *New Palestine* from 1943 to 1948 and wrote extensively on Jewish contemporary thought. In his later years he was a faculty member of Brandeis university at Waltham, Mass.

Lins de Barros, João Alberto, Brazilian diplomat (b. Recife, Pernambuco, Braz., June 16, 1897—d. Rio de Janeiro, Braz., Jan. 26, 1955).

Locke, Jesse D(wight), U.S. ambassador to Liberia (b. Cincinnati, O., May 31, 1891—d. Monrovia, Lib., April 10, 1955).

Loeb, Philip, U.S. actor (b. Philadelphia, Pa., 1894—d. New York, N.Y., Sept. 1, 1955).

Londonderry, Edward Charles Stewart Robert Vane-Tempest-Stewart, 8TH MARQUESS OF, British politician (b. Nov. 18, 1902—d. London, Eng., Oct. 18, 1955).

Lord, Daniel Aloysius, U.S. Roman Catholic clergyman and author (b. Chicago, Ill., April 23, 1888—d. St. Louis, Mo., Jan. 15, 1955), graduated from Loyola university, Chicago, Ill., in 1909. He was ordained priest as a Jesuit in 1923, meanwhile having served as professor of English at St. Louis university from 1917 to 1920. From 1913 to 1925 he was associate editor and, from 1925 to 1948, editor of *The Queen's Work*, a national Catholic magazine. He was also national director of the Sodality of Our Lady. Father Lord was well known for the religious pageants he produced and directed in various cities of the U.S. and Canada; also for his hymns and for his books, including *Armchair Philosophy* and *His Passion Forever*.

Loudon, John, Dutch diplomat (b. The Hague, Neth., 1866—d. The Hague, Nov. 12, 1955).

Loveday, William Carroll, U.S. composer (b. Sept. 23, 1896—d. New York, N.Y., June 19, 1955).

Loveman, Amy, U.S. editor and author (b. New York, N.Y., May 16, 1881—d. New York, N.Y., Dec. 11, 1955).

Lowry, Frank J(acob), U.S. naval officer (b. Cresco, Iowa, Feb. 15, 1888—d. Vallejo, Calif., March 26, 1955).

Lowsley, Oswald Swinney, U.S. urologist and surgeon (Santa Barbara, Calif., Sept. 4, 1884—d. Stamford, Conn., June 4, 1955).

McBride, Francis Scott, U.S. temperance leader (b. Carroll county, O., July 29, 1872—d. St. Petersburg, Fla., April 23, 1955).

McClelland, George William, U.S. educator (b. Dobbs Ferry, N.Y., June 18, 1880—d. Little Deer Isle, Me., Aug. 20, 1955).

McClure, Charles Freeman Williams, U.S. zoologist (b. Cambridge, Mass., March 6, 1865—d. Princeton, N.J., July 23, 1955).

McCormick, Robert Rutherford, U.S. publisher (b. Chicago, Ill., July 30, 1880—d. Wheaton, Ill., April 1, 1955), was the son of Robert S. McCormick, U.S. diplomat, and grandson of William McCormick, harvester manufacturer, and Joseph Medill, early editor of the *Chicago Tribune*. He attended Ludgrove school near Wokingham, Berks., Eng., Groton preparatory school in Massachusetts, and Yale university (B.A., 1903), later studied law at Northwestern university in Chicago, and was admitted to the Illinois bar in 1907. In 1904 he was elected Republican alderman of the Chicago city council and in the next year president of the board of trustees of the Chicago sanitary district, holding the latter office until 1910. In 1911 he became president of the *Chicago Tribune* and in 1914 joint editor-publisher with his cousin, Joseph M. Patterson. In the early part of World War I he was a war

correspondent on both the eastern and western fronts in Europe and in 1916, after his return to the U.S., served briefly with the U.S. army in the Mexican expedition of that year. After U.S. entry into World War I he was first an aide to Gen. John J. Pershing and then an artillery officer, being advanced to the rank of colonel and receiving the distinguished service medal for action during the battles of Cantigny, Soissons and St. Mihiel in France. Resuming active management of the *Tribune* after the war, Colonel McCormick became engaged in a long legal and editorial battle with William Hale Thompson, the mayor of Chicago, over alleged misuse of city funds. Previously he had tangled with Henry Ford, who had sued the *Tribune* for \$1,000,000 when the paper criticized Ford's views on U.S. military preparations during the Mexican border crisis; a jury later set damages at six cents. Colonel McCormick was one of the earliest political enemies of Pres. Franklin D. Roosevelt in 1933. The initial break came when McCormick objected strenuously to the National Recovery administration's proposed newspaper code on the grounds that it would end freedom of the U.S. press. The *Tribune's* attack soon broadened to embrace almost every domestic and foreign facet of the New Deal's program except its war measures after the Japanese attack on Pearl Harbor. With the same vehemence McCormick denounced Republican leaders whose political philosophies in his view coincided too closely with those of the Roosevelt and Truman administrations; he was particularly critical of Republican presidential candidates Wendell L. Willkie and Thomas E. Dewey on this score, and he supported Gen. Dwight D. Eisenhower only with reservations during the 1952 campaign. A keystone of the *Tribune's* editorial policy throughout this period was nonintervention in foreign entanglements of any kind. With Joseph M. Patterson, Colonel McCormick founded the *New York Daily News* in 1919, and from 1951 to 1954 he was publisher of the *Washington Times-Herald* (D.C.). He also developed vast newsprint properties in Canada. He was the author of several works on U.S. history and military subjects.

McCoy, Horace, U.S. novelist and scenarist (d. Beverly Hills, Calif., Dec. 15, 1955).

McDermott, Michael James, U.S. press officer and diplomat (b. Peabody, Mass., July 2, 1894—d. Washington, D.C., Aug. 5, 1955).

McDonald, Ellice, U.S. cancer research specialist and biochemist (b. Fort Ellice, Man., Oct. 27, 1876—d. near Wilmington, Del., Jan. 30, 1955).

McDonald, Harl, U.S. composer and conductor (b. near Boulder, Colo., July 27, 1899—d. Princeton, N.J., March 30, 1955).

Macfadden, Bernarr, U.S. publisher and physical culturist (b. near Mill Springs, Mo., Aug. 16, 1868—d. Jersey City, N.J., Oct. 12, 1955), achieved wealth as a magazine publisher and a degree of fame as an advocate of health measures that at times verged on cultism. His first venture into publishing was with the magazine *Physical Culture* (1898), followed by such other successful magazines as *True Story*, *True Romances*, *True Detective Mysteries* and *Master Detective*. On these publications Macfadden built a fortune devoted in part to propagation of his ideas about health and physical culture—including vegetarianism, hard exercise and periodic fasting. He personally demonstrated the results of this regimen by such acts as parachuting 2,500 ft. into the Hudson river on his 83rd birthday. From 1924 to 1930 Macfadden published the daily *New York Evening Graphic* and from 1931 to 1942 the magazine *Liberty*.

Mackie, Thomas Turlay, U.S. tropical disease authority (b. Great Barrington Mass., May 10, 1895—d. Westport, Conn., Oct. 5, 1955).

McLaren, Sir Charles Northrup, British civil servant (b. Glasgow, Scot., Oct. 14, 1898—d. London, Eng., June 8, 1955).

Macnab, Alexander J., U.S. army officer and big-game hunter (b. Salmon, Ida., 1878?—d. Honolulu, T.H., Nov. 4, 1955).

MacNaghten, Sir Frederic Fergus, British lawyer (b. May 19, 1867—d. London, Eng., Nov. 18, 1955).

McNally, Rev. Paul Aloysius, U.S. Jesuit and educator (b. Philadelphia, Pa., Oct. 14, 1890—d. Washington, D.C., March 4, 1955).

McNeil, Hector, British statesman, journalist and publisher (b. Garelochhead, Dunbartonshire, March 10, 1907?—d. New York, N.Y., Oct. 11, 1955), the son of a journeyman shipwright, was educated at Woodside school, Glasgow, and at Glasgow university. Shortly after graduating he joined the Scottish *Daily Express*, eventually becoming its night editor. In 1941 he entered parliament, unopposed, as Labour member for Greenock, retaining the seat until his death. After a year he became parliamentary private secretary to Philip Noel Baker at the ministry of war transport, and after Labour's victory in 1945, he became parliamentary under secretary of state at the foreign office. Ernest Bevin's frequent absences abroad resulted in important responsibilities falling to McNeil as government spokesman on foreign policy in the house of commons. He played an important part at the Paris Peace conference and in Oct. 1946 he was promoted to the newly created position of minister of state at the foreign office. In the same year he became the youngest member of the privy council. During the next four years he first, through UNRRA and the UN Economic and Social council, became deeply involved in the rehabilitation of Greece and other liberated European peoples; secondly, as leader of the British delegation to the UN general assembly (vice-president, 1947), he was one of the first to stand up to the browbeating of the Soviet delegate, A. Vishinsky. In speeches during 1947–49 he repeatedly criticized the Soviet bloc for its unco-operative and threatening attitude in the United Nations. In March 1950 he was promoted secretary of state for Scotland and a member of the cabinet. After Labour went into opposition in Oct. 1951 McNeil withdrew from politics. In that year he took up an appointment with Encyclopædia Britannica, Ltd., becoming chairman of the British company of that U.S. publishing firm in 1953. He had a stroke while travelling on business to the United States on the "Queen Mary" and died in a hospital a few days later.

McNutt, Paul Vories, U.S. political leader, attorney and diplomat (b. Franklin, Ind., July 19, 1891—d. New York, N.Y., March 24, 1955), took his B.A. degree from Indiana university, Bloomington, in 1913 and his law degree from Harvard law school in 1916. From 1917 to 1925 he taught law at Indiana university and was dean of the university's law school from 1925 to 1933, when he resigned after election on the Democratic ticket in 1932 as governor of Indiana for the term 1933–37. Meanwhile he had been elected national commander of the American Legion for 1928–29 (he had served as an artil-

- lery officer in World War I). From 1937 to 1939 McNutt was U.S. high commissioner to the Philippine Islands and in the latter year he was appointed first administrator of the Federal Security administration. Pres. Franklin D. Roosevelt in 1942 appointed McNutt chairman of the War Manpower commission. In 1945 Pres. Harry S. Truman named him to his former office of high commissioner to the Philippines, and the next year McNutt became first U.S. ambassador to the new Republic of the Philippines, serving in this office until 1947.
- Magnus-Levy, Adolph**, U.S. physician and scientist (b. Berlin, Ger., Sept. 9, 1865—d. New York, N.Y., Feb. 6, 1955).
- Malcolm, Sir Douglas Orme**, British business executive (b. Epsom, Eng., Aug. 6, 1877—d. London, Eng., Aug. 30, 1955).
- Mann, Thomas**, German novelist (b. Lübeck, June 6, 1875—d. Zürich, Switz., Aug. 12, 1955). For his early career see *Encyclopaedia Britannica*. In Italy, in 1897, he began to write *Buddenbrooks*, a lengthy novel chronicling a mercantile family's decline in the person of an artist; it appeared late in 1900 and Mann was "snatched up in a whirl of success." Before 1914 he wrote a series of short stories, *Tristan* (1903), which included "Tonio Kröger"; a novel *Königliche Hochzeit* (1909); and the short *Der Tod in Venedig*, "Death in Venice" (1912). He also wrote a play, *Fiorenza* (1906). In 1905 he married Katja Pringsheim by whom he had six children; the eldest, Erika, married the poet W. H. Auden. Mann's *Betrachtungen eines Unpolitischen*, "Reflections of an Unpolitical Man" (1918) showed the strength of his belief then in the destiny of the German people. Among his other writings of this period were the essays *Friedrich und die grosse Koalition* (1915) and the important *Der Zauberberg*, "The Magic Mountain" (begun 1912, published 1924). In the period before his exile he wrote short works such as *Mario der Zauberer*, "Mario the Magician" (1930). His polemic inclinations were growing restive at the coming of the dictatorships and in 1933 he left Germany. He travelled in Europe and America and, after being deprived of German citizenship, became a Czechoslovak citizen, later moving to the United States where he was naturalized. During World War II he made anti-Nazi broadcasts to the German people, and in 1954 he settled in Zürich. His exile had not diminished his output, which included most of the large biblical tetralogy *Joseph und Seine Brüder* (1933-43), *Lotte in Weimar* (1939) and, in addition to fiction, some political writings. After World War II appeared *Doktor Faustus* (1947), a difficult novel on a famous theme, followed by *Der Erwählte* (1951), known in English as "The Holy Sinner," and *Die Betrogene* (1953), known in English as "The Black Swan," both rather macabre works. His last work, begun in the 1920s and growing with successive editions (1922, 1932, 1954), was *Bekenntnisse des Hochstaplers Felix Krull*, a comic novel about a rogue. Thomas Mann was awarded the Nobel prize for literature in 1929.
- March, Peyton Conway**, U.S. general and chief of staff in World War I (b. Easton, Pa., Dec. 27, 1864—d. Washington, D.C., April 13, 1955), was awarded his bachelor's degree in 1884 and his master's degree in 1887 from Lafayette college, Easton, where his father was professor of philology, and graduated with honours from the U.S. military academy in 1888. Commissioned lieutenant of artillery, he graduated from the army artillery school at Ft. Monroe, Va., in 1898 and in the same year commanded a volunteer mountain battery in the Philippines during the war with Spain. Following that war he saw further service in the Philippines, on the staff of Maj. Gen. Arthur MacArthur, father of Douglas MacArthur, and in 1904 was a military attaché to the Japanese army in Manchuria during the Russo-Japanese war. Shortly after the U.S. declaration of war against Germany in April 1917 March was made U.S. army artillery commander in France, having by this time attained the rank of major general. Recalled to Washington as acting chief of staff in March 1918, he was appointed chief of staff the following May 20 with the rank of full general. As chief U.S. military officer he merged the various branches of the regular and volunteer armies and directed a mobilization program that ultimately transported 2,000,000 men to France before the end of World War I. General March retired in 1921 but continued to serve the government as adviser on matters of national security. He received the special thanks of the U.S. congress by joint resolution in 1953 for his military services to the nation.
- Markovic, Lazar**, Yugoslav politician and lawyer (b. 1883—d. Belgrade, Yugo., April 15, 1955).
- Marks, Lionel Simeon**, U.S. engineer and professor (b. Birmingham, Eng., Sept. 8, 1871—d. Cambridge, Mass., Jan. 6, 1955).
- Marquet, Adrien**, French politician (b. 1885?—d. Bordeaux, Fr., April 3, 1955).
- Martin, Clarence Eugene**, U.S. lawyer and politician (b. Martinsburg, W.Va., March 13, 1880—d. Martinsburg, April 24, 1955).
- Martin, Glenn L.**, U.S. aviation pioneer and industrialist (b. Macksburg, Ia., Jan. 17, 1886—d. Baltimore, Md., Dec. 4, 1955), was one of the earliest U.S. certified pilots and later helped design and construct some of the most famous U.S. military and commercial aircraft. Martin left Kansas Wesleyan university, Salina, before graduation to spend full time designing and flying gliders, and in 1909 he built and flew his first powered aircraft—constructed principally of silk and bamboo. Two years later he received one of the first U.S. pilot's licenses. In 1912 he made the first U.S. over-water flight, from Catalina Island to the California mainland. A year before he had organized the Glenn L. Martin company at Santa Ana, Calif., to manufacture planes, and this corporation was awarded its first government contract in 1913. Later Martin's company, re-established after a temporary merger with another, moved to Cleveland, O., and in 1929 to Baltimore, Md. The Martin bomber became famous during the 1920s, as later did the company's trans-oceanic "Clippers," the huge flying boat "Mars," and the Martin jet fighters during and after the Korean war. In 1955 the company was awarded the primary U.S. contract to build and launch earth-circling satellites. Martin in 1933 received the Collier trophy, top U.S. aviation award.
- Marvel, Josiah Jr.**, U.S. diplomat (b. Wilmington, Del., Nov. 26, 1904—d. Wilmington, Dec. 29, 1955).
- Matthison, Edith Wynne** (MRS. CHARLES RANN KENNEDY), U.S. actress (b. Birmingham, Eng., Nov. 23, 1875—d. West Los Angeles, Calif., Sept. 23, 1955).
- Maximos, Demetrios**, Greek banker and politician (b. Patras, Gr., July 6, 1873—d. Athens, Gr., Oct. 16, 1955).
- May, Samuel Chester**, U.S. educator (b. Portland, Ore., Dec. 7, 1887—d. New York, N.Y., Sept. 30, 1955).
- Mayer, Oscar F.**, U.S. meat packer (b. Kaesingen, Ger., May 29, 1859—d. Chicago, Ill., March 11, 1955).
- Mayne, Sir (Ashton Gerard Oswald) Mosley**, British army officer (b. Bruton, Somerset, Eng., April 24, 1889—d. London, Dec. 17, 1955).
- Mellanby, Sir Edward**, British physician (b. West Hartlepool, Eng., 1884—d. London, Jan. 30, 1955).
- Merriam, Frank Finley**, U.S. politician (b. Hopkinton, Iowa, Dec. 22, 1865—d. Long Beach, Calif., April 25, 1955).
- Merrill, Frank D.**, U.S. army officer (b. Woodville, Mass., Dec. 4, 1903—d. Fernandina Beach, Fla., Dec. 11, 1955), organized and led the famous "Merrill's Marauders," a group of trained jungle troops that helped free northern Burma from the Japanese in 1944 and thus open up communications between China and India during the latter phases of World War II. After serving as an enlisted man in the regular U.S. army since 1922, Merrill was admitted to the U.S. military academy at West Point, N.Y., graduating in 1929 with a lieutenant's commission. He also received an engineering degree from the Massachusetts Institute of Technology, Cambridge, in 1932. In 1938 he was appointed assistant military attaché at Tokyo, Jap., and there became proficient in Japanese and Chinese. In Nov. 1941, a month before the Japanese attack on Pearl Harbor, he was appointed intelligence officer on Gen. Douglas MacArthur's staff in the Philippines. Merrill was sent almost immediately to Burma and there was military aide to Gen. Joseph W. Stilwell during the latter's retreat into India in 1942. In Oct. 1943 Merrill began training his "Marauders," who started harassing Japanese communications in Burma the following February and within six months were in Myitkyina, key city of northern Burma, near the Chinese border. Advanced to the rank of major general in 1944, he was commander of the Sixth army with headquarters at San Francisco, Calif., after World War II, retiring in 1947. From 1949 until his death he was state highway commissioner of New Hampshire.
- Milione, Louis G. Sr.**, U.S. sculptor (b. Padula, It., Feb. 22, 1884—d. Philadelphia, Pa., March 26, 1955).
- Miller, Bob**, U.S. song writer (b. Memphis, Tenn., Sept. 20, 1895—d. Nyack, N.Y., Aug. 26, 1955).
- Milles, Carl Wilhelm Emil**, Swedish sculptor (b. Lagga, near Uppsala, June 23, 1875—d. Stockholm, Sept. 19, 1955), was apprenticed to a carpenter in Stockholm and won a scholarship which took him in 1897 to Paris where he studied under Auguste Rodin for eight years. In 1901 he entered an open competition for a monument to a Swedish national hero, Sten Sture, although it was more than ten years before he was awarded the commission and it was not until 1925 that the bronze group was finally set up in Uppsala. After he returned to Sweden his work increased greatly and his monuments and fountains, in which he specialized, adorned many places in Europe and the United States, where he spent long periods in later life. Milles taught at Cranbrook academy, Michigan, from 1936 and became a U.S. citizen in 1945, but he never relinquished his Swedish home. The best known of this versatile artist's works include the massive Poseidon at Göteborg, the Folke Filbyter memorial at Linköping and his Triton fountains in Stockholm and Chicago. He worked in many materials, preferring bronze and granite, and was particularly interested in animal subjects. His remarkable museum house at Lidingö, Swed., known as Milles garden, is furnished with his statues.
- Milton, George Fort**, U.S. author and editor (b. Chattanooga, Tenn., Nov. 19, 1894—d. Washington, D.C., Nov. 12, 1955).
- Minewitch, Borrah**, U.S. musician (b. Kiev, Russia, 1902?—d. Paris, Fr., June 26, 1955).
- Minger, Rudolf**, Swiss politician (b. Muelchi, Switz., Nov. 13, 1881—d. Schuepfen, Switz., Aug. 23, 1955).
- Mings, Howard L.**, U.S. writer and artist (b. Athens, Pa., April 24, 1891—d. New York, N.Y., Dec. 29, 1955).
- Miranda, Carmen** (MARIA DO CARMO MIRANDA DA CUNHA), Brazilian dancer and actress (b. Lisbon, Port., 1913—d. Beverly Hills, Calif., Aug. 5, 1955), was taken in babyhood by her parents to Rio de Janeiro, Braz. Educated in a Catholic convent there, she later took up singing and dancing and by the early 1930s had become a well-known radio and stage performer in Brazil. She went to the United States in 1939, appearing in *Streets of Paris* on Broadway that year, and later starring in night club shows and in 1940 making her first motion picture, *Down Argentine Way*. Many movie starring roles and television performances followed for the "South American bombshell," as she was known.
- Mirkin-Guetzevitch, Boris**, French educator (b. Kiev, U.S.S.R., Jan. 1, 1892—d. Paris, Fr., April 1, 1955).
- Mitchell, Charles Edwin**, U.S. banker (b. Chelsea, Mass., Oct. 6, 1877—d. New York, N.Y., Dec. 14, 1955).
- Mitchell, Harry Brown**, U.S. newspaperman and government official (b. Scotland, 1867?—d. Great Falls, Mont., Sept. 30, 1955).
- Mitchell, William DeWitt**, U.S. attorney and cabinet member (b. Winona, Minn., Sept. 9, 1874—d. Syosset, L.I., N.Y., Aug. 24, 1955), graduated from the University of Minnesota, Minneapolis, in 1895, took his law degree there the next year, and began practice in St. Paul, Minn. He served in both the Spanish-American war and World War I. Although a Democrat, he was appointed U.S. solicitor general by Pres. Calvin Coolidge in 1925, serving until 1929. Pres. Herbert Hoover named Mitchell attorney general in 1929 and he remained in that cabinet office throughout the Hoover administration. His was the unpopular duty of enforcing the 18th (Prohibition) amendment. In 1933 Mitchell re-established private law practice in New York city. In 1945 he was chief counsel of the joint congressional committee investigating the Japanese attack on Pearl Harbor.
- Moniz, Antonio Caetano de Abreu Freire Egas**, Portuguese surgeon and diplomat (b. Avanca, Port., Nov. 29, 1874—d. Lisbon, Port., Dec. 13, 1955).
- Moore, Carl Richard**, U.S. zoologist (b. near Springfield, Mo., Dec. 5, 1892—d. Chicago, Ill., Oct. 16, 1955).

Moore, Ernest Carroll, U.S. educator (b. Youngstown, O., July 20, 1871—d. Los Angeles, Calif., Jan. 23, 1955).
Moore, Frank Gardner, U.S. educator (b. West Chester, Pa., Sept. 25, 1865—d. Cleveland, O., Nov. 18, 1955).
Moore, Tom, Irish-American actor (b. County Meath, Ire., 1885—d. Santa Monica, Calif., Feb. 12, 1955).
Morey, Charles Rufus, U.S. educator and author (b. Hastings, Mich., Nov. 20, 1877—d. Princeton, N.J., Aug. 28, 1955).
Morgan, John Hartman, British jurist and army officer (b. Ystrad, Wales, March 20, 1876—d. Wootton Bassett, Eng., April 8, 1955).

Morrow, Elizabeth Reeve Cutter (MRS. DWIGHT WHITNEY MORROW), U.S. educator and author (b. Cleveland, O., May 29, 1873—d. Englewood, N.J., Jan. 23, 1955), was the wife of Dwight W. Morrow (1873-1931), U.S. diplomat, and the mother of Anne Spencer Morrow (Mrs. Charles A. Lindbergh). She was graduated from Smith college, Northampton, Mass., in 1896 and took graduate work at the Sorbonne in Paris, Fr. As acting president of Smith college in 1939-40 she was the first woman chief executive of that institution. Mrs. Morrow published several works in verse and prose, including *Quatrains for My Daughter* (1931), *A Pint of Judgment* (1939) and *My Favorite Age* (1943).

Moseley, John Ohleyer, U.S. educator and fraternity executive (b. Meridian, Miss., Oct. 21, 1893—d. Chicago, Ill., Oct. 10, 1955).

Mott, John Raleigh, U.S. religious leader and Nobel prize winner (b. Livingston Manor, N.Y., May 25, 1865—d. Orlando, Fla., Jan. 31, 1955), graduated from Cornell university, Ithaca, N.Y., in 1888 and in the same year became identified with the international committee of the Young Men's Christian association as student secretary. He was general secretary of this committee from 1915 to 1931. Participating in many other U.S. and world groups of the Y.M.C.A., Mott also was active in promoting international missionary movements and was a leader of the World Federation of Churches movement. In 1946 he was named co-winner of the Nobel peace prize, with Emily Greene Balch.

Mudd, Harvey Seeley, U.S. mining engineer (b. Leadville, Colo., Aug. 30, 1888—d. Beverly Hills, Calif., April 12, 1955).

Munson, Ona, U.S. actress (b. Portland, Ore., June 16, 1906—d. New York, N.Y., Feb. 11, 1955).

Murphy, Daniel Francis, U.S. baseball player (b. Philadelphia, Pa., Aug. 11, 1876—d. Jersey City, N.J., Nov. 22, 1955).

Murray-Jacoby, Herman, U.S. diplomat, explorer, author and economist (b. Nov. 25, 1892—d. West Palm Beach, Fla., Jan. 26, 1955).

Musselwhite, Harry Webster, U.S. congressman (b. near Coldwater, Mich., May 23, 1868—d. San Mateo, Calif., Dec. 14, 1955).

Myer, Walter Evert, U.S. educator and publisher (b. Winfield, Kans., April 16, 1889—d. Washington, D.C., Oct. 25, 1955).

Myers, Henry Alonzo, U.S. educator (b. Newburgh, N.Y., April 9, 1906—d. Ithaca, N.Y., May 2, 1955).

Neal, Josephine Bicknell, U.S. physician (b. Belmont, Me., Oct. 10, 1880—d. New York, N.Y., March 19, 1955).

Neal, John Mandt, U.S. congressman (b. Burke, Wis., Oct. 10, 1870—d. Madison, Wis., Jan. 29, 1955).

Neuburger, Max, Austrian historian and neurologist (b. Vienna, Aus., 1868—d. Vienna, March 15, 1955).

Nevils, Rev. William Coleman, U.S. Jesuit and educator (b. Philadelphia, Pa., May 29, 1878—d. New York, N.Y., Oct. 12, 1955).

Noble, Sir Percy Lockhart Harnam, British naval officer (b. Jan. 16, 1880—d. London, Eng., July 25, 1955).

Nordfeldt, Bror Julius Olsson, U.S. artist (b. Sweden, April 13, 1878—d. Henderson, Tex., April 21, 1955).

Norman, Herman Cameron, British diplomat and classical scholar (b. Bromley Common, Eng., June 8, 1872—d. London, Sept. 8, 1955).

O'Brien, Robert Lincoln, U.S. publisher (b. Abington, Mass., Sept. 14, 1865—d. Washington, D.C., Nov. 23, 1955).

Ochs, Milton Barlow, U.S. publisher (b. Cincinnati, O., Jan. 29, 1864—d. Chattanooga, Tenn., April 30, 1955).

Oglesby, Woodson Ratcliffe, U.S. congressman and lawyer (b. near Shelbyville, Ky., Feb. 9, 1867—d. Quincy, Fla., April 30, 1955).

Ohrstrom, George Lewis, U.S. financier and industrialist (b. Ford River, Mich., Aug. 16, 1894—d. The Plains, Va., Nov. 9, 1955).

O'Leary, Rev. William Doris, U.S. Roman Catholic priest and educator (b. Augusta, Ga., Aug. 31, 1895—d. New Orleans, La., Feb. 1, 1955).

Ortega y Gasset, José, Spanish philosopher and writer (b. Madrid, Sp., May 9, 1883—d. Madrid, Oct. 18, 1955).

Orton, Helen Fuller (MRS. JESSE F. ORTON), U.S. author (b. Pekin, N.Y., Nov. 1, 1872—d. New York, N.Y., Feb. 16, 1955).

Orwin, Charles Stewart, British economist (b. Warnham, Eng., 1876—d. Blewbury, Eng., June 30, 1955).

Oursler, Grace Perkins (MRS. FULTON OURSLER), U.S. novelist and editor (b. Boston, Mass., Aug. 20, 1900—d. New York, N.Y., Dec. 16, 1955).

Packard, Laurence Bradford, U.S. history professor (b. Brockton, Mass., Jan. 20, 1887—d. Amherst, Mass., Jan. 14, 1955).

Paget, Sir Richard, British barrister and scientist (b. Jan. 13, 1869—d. London, Eng., Oct. 23, 1955).

1955 OBITUARIES: Hector McNeil, British statesman; Paul V. McNutt, U.S. politician; Thomas Mann, German novelist; Glenn L. Martin, U.S. industrialist; Carmen Miranda, Brazilian dancer

Palmer, John McAuley, U.S. army officer (b. Carlinville, Ill., April 23, 1870—d. Washington, D.C., Oct. 26, 1955).

Pani, Alberto J., Mexican engineer and diplomat (b. Aguascalientes, Mex., June 12, 1878—d. Mexico City, Mex., Aug. 25, 1955).

Papagos, Alexandros, Greek army officer and statesman (b. Athens, Gr., Dec. 9, 1883—d. Athens, Oct. 4, 1955), son of Gen. Leonidas Papagos and Marie née Averoff. After studying at the Greek War academy, Brussels Military academy and the Cavalry school at Ypres, Belg., he was commissioned in 1906 in a Greek cavalry regiment. He served in the Balkan wars (1912-13) and in the Anatolian campaign (1919-22). For a few months Papagos was minister of war in the Kondylis cabinet (1935) and took a leading part in the restoration of the monarchy. After the return of King George II he was appointed inspector general of the army and in 1936 chief of the general staff. When Italy attacked Greece, Oct. 28, 1940, he was commander-in-chief of the Greek forces. He checked the invasion, took the offensive and conquered the southern part of Albania; but when German forces, coming from Bulgaria, also attacked Greece (April 6, 1941) his skillful strategy could not hold out against superior force. Remaining in Greece after the occupation of the country, he was taken as a hostage by the Germans in 1943 and imprisoned in various concentration camps, including Dachau. Liberated in May 1945 by the U.S. 5th army from a camp in the Tirol, Papagos returned to Greece, was recalled to active service, promoted to full general in July 1947 and appointed commander in chief Jan. 20, 1949. In the Grammos-Vitsi area, familiar to him from 1940-41, with U.S. arms and the friendly advice of Gen. James Van Fleet, he destroyed the remaining Communist rebel strongholds in Greece. On Oct. 28, he was promoted to field marshal, the first Greek professional soldier to hold that rank. In May 1951 he relinquished the supreme command and entered politics as leader of the Greek rally (*Ellinikos Synagermos*). After the election of Nov. 16, 1952, which resulted in a landslide victory of his party, Papagos formed a government. In 1954 he paid official visits to Paris, Bonn, Madrid and Lisbon. He had been seriously ill with tuberculosis since Jan. 1955.

Pappenheimer, Alwin Max, U.S. pathologist and educator (b. New York, N.Y., Dec. 4, 1878—d. Cambridge, Mass., Feb. 21, 1955).

Parker, Arthur Caswell, U.S. anthropologist, archaeologist and author (b. Iroquois, N.Y., April 5, 1881—d. Naples, N.Y., Jan. 1, 1955).

Parker, George Howard, U.S. zoologist and author (b. Philadelphia, Pa., Dec. 23, 1864—d. Cambridge, Mass., March 26, 1955).

Pasquel, Jorge, Mexican sportsman and businessman (b. Vera Cruz, Mex., 1907?—d. near Mexico City, Mex., March 7, 1955).

Patterson, William J., U.S. government official (b. Neenah, Wis., June 4, 1880—d. Washington, D.C., Nov. 24, 1955).

Payne, Roger, British lawyer (b. England—d. New York, N.Y., Feb. 23, 1955).

Peary, Josephine Diebitsch, U.S. explorer (b. Washington, D.C., May 22, 1863—d. Portland, Me., Dec. 19, 1955).

Pease, Edward Reynolds, British socialist (b. Durham, Eng., Dec. 20, 1857—d. Limsfield, Eng., Jan. 5, 1955).

Pechstein, Max Hermann, German artist (b. Zwickau, Ger., Dec. 31, 1881—d. Berlin, Ger., June 29, 1955).

Perrine, Van Dearing, U.S. artist (b. Garnett, Kans., Sept. 10, 1868—d. Stamford, Conn., Dec. 10, 1955).

Person, Harlow Stafford, U.S. economist (b. Republican City, Neb., Feb. 16, 1875—d. Dobbs Ferry, N.Y., Nov. 7, 1955).

Persons, William Frank, U.S. social worker (b. Brandon, Iowa, Aug. 31, 1876—d. Cranford, N.J., May 27, 1955).

Peters, John Punnett, U.S. educator and physician (b. Philadelphia, Pa., Dec. 4, 1887—d. New Haven, Conn., Dec. 29, 1955).

Peurifoy, John E(mil), U.S. diplomat (b. Walterboro, S.C., Aug. 9, 1907—d. near Hua Hin, Thailand, Aug. 12, 1955), studied at the U.S. military academy, West Point, N.Y., from 1926 to 1928 and later at American university and George Washington university in Washington, D.C. After several years in private business he joined the staff of the U.S. treasury department in 1935 and three years later went to the state department, where he shortly became a divisional assistant. Promoted rapidly through various divisions, he was deputy undersecretary of state by 1949 and the following year was named ambassador to Greece. In Athens he was credited with helping the Greek government successfully turn back a renewed Communist bid for power. Transferred to Guatemala in Nov. 1953 as ambassador, Peurifoy had a major role in effecting the overthrow of the Communist regime of Pres. Jacobo Arbenz Guzmán in June 1954 and preventing a subsequent civil war which threatened to break out. Peurifoy was named ambassador to Thailand Sept. 15, 1954. He and a son (Daniel) were killed in an automobile accident near the seaside resort of Hua Hin.

Piantadosi, Al, U.S. song writer and composer (b. New York, N.Y., July 18, 1884—d. Encino, Calif., April 8, 1955).

Pick, Albert Sr., U.S. hotel owner (b. Chicago, Ill., May 17, 1869—d. Miami Beach, Fla., July 9, 1955).

Pigott, Sir Stephen Joseph, British shipbuilder (b. Cornwall, N.Y., Jan. 30, 1880—d. Closeburn, Scot., Feb. 27, 1955).

Pine, William Hoy, U.S. motion picture producer (b. Los Angeles, Calif., Feb. 15, 1896—d. Hollywood, Calif., April 29, 1955).

Platt, Sir Frank, British cotton executive (b. Rochdale, Eng., June 9, 1890—d. Bramhall, Eng., July 8, 1955).

Plevier, Theodor, German author (b. Berlin, Ger., Feb. 12, 1892—d. Avegno, Switz., March 12, 1955).

- Pogany, Willy (William Andrew)**, Hungarian-U.S. artist (b. Szeged, Hung., Aug. 24, 1882—d. New York, N.Y., July 30, 1955), was one of the most versatile artists of his time, ranging in his work from caricature and book and slick-paper magazine illustration to costume and stage design, sculpture, portrait painting, etching, architecture, art teaching and production of animated cartoons for motion pictures. As a youth he studied at the University of Budapest, Hung., at Munich and at Paris. Emigrating to the U.S. in 1914, he designed costumes and sets for the Metropolitan opera company and later for numerous Broadway and Hollywood productions. Among the 150 or more books illustrated by Pogany were *Pogany's Mother Goose* and many children's and adult classics. His murals decorated a number of theatres, hotels, commercial and public buildings and private estates in New York city and vicinity and elsewhere. He was the author of several books on art instruction.
- Polyak, Stephen L.**, U.S. eye anatomist (b. Gjurgjevac, Yugo., Dec. 13, 1889—d. Chicago, Ill., March 9, 1955).
- Poole, Sidman Parmelee**, U.S. geographer (b. Syracuse, N.Y., Oct. 19, 1893—d. Charlottesville, Va., Oct. 28, 1955).
- Potear, Edwin McNeill**, U.S. Baptist clergyman, educator and author (b. New Haven, Conn., Nov. 20, 1892—d. Raleigh, N.C., Dec. 17, 1955).
- Powell, Thomas Reed**, U.S. professor of law (b. Richford, Vt., April 29, 1880—d. Boston, Mass., Aug. 16, 1955).
- Powers, Tom**, U.S. actor (b. Owensboro, Ky., July 7, 1890—d. Manhattan Beach, Calif., Nov. 9, 1955).
- Prittwitz and Gaffron, von, Friedrich Wilhelm**, German diplomat (b. Stuttgart, Ger., Sept. 1, 1884—d. Munich, Ger., Sept. 1, 1955).
- Pugh, Sir Arthur**, British labor union official (b. Ross, Eng., 1870—d. Bedford, Eng., Aug. 1, 1955).
- Pulitzer, Joseph**, U.S. publisher (b. New York, N.Y., March 21, 1885—d. St. Louis, Mo., March 30, 1955), was the son of Joseph Pulitzer, publisher of the *St. Louis Post-Dispatch* and of the old *New York World*. The younger Pulitzer attended Harvard university and in 1906 began his newspaper career with the *Post-Dispatch*, becoming president of the Pulitzer Publishing company in 1912. Under his supervision the *Post-Dispatch* won a number of national journalistic awards for public achievement, including five Pulitzer prizes. Notable editorial investigations conducted by his paper included those into the Teapot Dome oil lease scandal of the 1920s, bribery of U.S. internal revenue officials, and operations of national crime syndicates.
- Puma, Fernando**, U.S. artist and author (b. New York, N.Y., Feb. 14, 1919—d. New York, Dec. 4, 1955).
- Putnam, Herbert**, U.S. librarian (b. New York, N.Y., Sept. 20, 1861—d. Woods Hole, Mass., Aug. 15, 1955), graduated from Harvard in 1883 and later studied law at Columbia university, being admitted to the Minnesota state bar in 1886. After library work in Minneapolis, Minn. (1884-91), he practiced law in Boston, Mass. (1892-95). He became librarian of the Boston public library in 1895. Four years later he was appointed by Pres. William McKinley librarian of congress, serving until his retirement as librarian emeritus Aug. 1, 1939. During his tenure of office the library's number of volumes grew from fewer than 1,000,000 to more than 5,500,000. The Herbert Putnam award for outstanding librarianship was established in his honour. He was twice president (in 1898 and in 1904) of the American Library association.
- Radaceanu, Lotar**, Rumanian educator and politician (d. Helsinki, Fin., Aug. 25, 1955).
- Raemisch, Waldemar**, U.S. sculptor (b. Berlin, Ger., Aug. 19, 1888—d. Rome, It., April 14, 1955).
- Ramsden, Sir Eugene Joseph Squire Hargreaves**, 1ST BARON OF, British industrialist and politician (b. Feb. 2, 1883—d. Gomersal, Eng., Aug. 9, 1955).
- Ray, E. Lansing**, U.S. publisher and editor (b. St. Louis, Mo., Aug. 30, 1884—d. Rye Beach, N.H., Aug. 30, 1955).
- Raycroft, Joseph Edward**, U.S. educator and professor of hygiene (b. Williamstown, Vt., Nov. 15, 1867—d. Trenton, N.J., Sept. 30, 1955).
- Reichard, Gladys Amanda**, U.S. anthropologist and author (b. Bangor, Pa., July 17, 1893—d. Flagstaff, Ariz., July 25, 1955).
- Reid, Albert Turner**, U.S. artist and publisher (b. Concordia, Kans., Aug. 12, 1873—d. New York, N.Y., Nov. 26, 1955).
- Remón, José Antonio**, Panamanian president (b. Panamá city, Panamá, June 1, 1908—d. Panamá city, Jan. 2, 1955), was educated at the Mexican Military academy in Mexico City and joined the Panamanian national police force in 1931, advancing subsequently to the rank of colonel. By 1949 he was the national chief of police and "strong man" of Panamá. In that year he brought about the resignation of Pres. Daniel Chánis, Jr., despite a decision by the nation's supreme court affirming Chánis' legal right to the office. Again on May 10, 1951, Remón overthrew the administration of Arnulfo Arias and installed Alcibiades Arosemena in the presidency. In 1951 Remón himself campaigned for the presidency as the candidate of a national five-party coalition. In elections held May 11, 1952, he was elected by a large majority, receiving the largest number of votes in the nation's history. He took office as 28th president of Panamá on Oct. 1, 1952, for a four-year term. During his presidency he reduced Panamá's national debt and increased substantially the country's agricultural output. His assassination at a race track in Panamá city gave rise to new unrest in the Central American republic. (See PANAMÁ.)
- Renner, George Thomas Jr.**, U.S. geographer (b. Winfield, Kans., July 11, 1900—d. Leonia, N.J., Oct. 14, 1955).
- Reynolds, Richard Samuel Sr.**, U.S. financier (b. Bristol, Tenn., Aug. 15, 1881—d. Richmond, Va., July 29, 1955).
- Richards, Rev. George Warren**, U.S. clergyman and educator (b. Farmington, Pa., April 26, 1869—d. Lancaster, Pa., June 11, 1955).
- Riskin, Robert**, U.S. screen writer (b. New York, N.Y., 1897—d. Woodland Hills, Calif., Sept. 20, 1955).
- Rist, Charles**, French economist (b. Switzerland, Jan. 1, 1874—d. Paris, Fr., Jan. 11, 1955).
- Robbins, Reginald Chauncey**, U.S. author and poet (b. Boston, Mass., Nov. 10, 1871—d. Santa Barbara, Calif., Nov. 19, 1955).
- Roberts, Owen Josephus**, U.S. jurist and supreme court justice from 1930 to 1945 (b. Philadelphia, Pa., May 2, 1875—d. West Vincent township, Pa., May 17, 1955), was educated at the University of Pennsylvania, Philadelphia, where he received his bachelor's degree in 1895 and his law degree in 1898. After years of private practice in Philadelphia, he first attracted national attention as one of the special federal prosecutors in the oil reserve scandals of the 1920s which had originated during the administration of Pres. Warren G. Harding. In 1930 Pres. Herbert C. Hoover named Roberts associate justice of the U.S. supreme court. During his 15-year tenure, Roberts sided at times with the liberal wing of the court and at other times with the conservatives, upholding or opposing various New Deal legislative acts; he opposed Pres. Franklin D. Roosevelt's plan to "pack" the supreme court in 1937. Shortly after the Japanese attack on Pearl Harbor in Dec. 1941, while he was still on the bench, Roberts was named chairman of a special commission to investigate the attack. In the commission's report made public early in 1942, the U.S. navy and army commanders in Hawaii were held responsible for errors of judgment. Roberts resigned from the court in 1945, and from 1948 to 1951 he was dean of the University of Pennsylvania's school of law.
- Roberts, William Alva**, U.S. industrialist (b. Osceola, Mo., Aug. 25, 1897—d. Milwaukee, Wis., April 12, 1955).
- Röchling, Hermann**, German industrialist (b. Saarbrücken, Nov. 12, 1872—d. Mannheim, Aug. 25, 1955).
- Rodeheaver, Homer Alvan**, U.S. composer and author (b. Union Furnace, C. Oct. 4, 1880—d. Winona Lake, Ind., Dec. 18, 1955).
- Ross, Anthony (ANTHONY ROSENTHAL)**, U.S. actor (b. New York, N.Y., 1906—d. New York, Oct. 25, 1955).
- Ross, Jerry (JEROLD ROSENBERG)**, U.S. song writer (b. New York, N.Y., March 9, 1926—d. New York, N.Y., Nov. 11, 1955).
- Rothschild, Baron Louis**, Austrian banker (b. Vienna, Aus., March 5, 1882—d. Jamaica, B.W.I., Jan. 15, 1955).
- Roush, Gar A.**, U.S. editor and mineral economist (b. Harrisburg [now Gettysburg], Ind., Oct. 21, 1883—d. Arlington, Va., Aug. 17, 1955).
- Rubinstein, Serge**, Russian-born financier (b. St. Petersburg [now Leningrad], U.S.S.R., 1909—d. New York, N.Y., Jan. 27, 1955).
- Rupprecht, Maria Luipoldt Ferdinand**, CROWN PRINCE OF BAVARIA, count Palatine of the Rhine, duke of Bavaria, Franconia and Swabia, and head of the house of Wittelsbach (b. Munich, Ger., May 18, 1869—d. Leutsteden castle, southern Bavaria, Aug. 2, 1955).
- Sakall, S. Z.**, Hungarian-born motion picture actor (b. Budapest, Hung., Feb. 2, 1893—d. Hollywood, Calif., Feb. 12, 1955).
- Salmon, Edward**, British editor (b. 1865—d. London, Eng., Sept. 23, 1955).
- Salter, Robert Mundhenk**, U.S. scientist (b. Huntington, Ind., March 31, 1894—d. Washington, D.C., Sept. 13, 1955).
- Schenck, Eunice Morgan**, U.S. educator (b. Brooklyn, N.Y., Dec. 8, 1884—d. Port Jefferson, N.Y., May 7, 1955).
- Schlueter, Robert Ernst**, U.S. surgeon (b. St. Louis, Mo., June 9, 1872—d. St. Louis, Mo., Feb. 12, 1955).
- Schneider, Hannes**, Austrian-born ski instructor (b. Stuben, Aus., 1890?—d. North Conway, N.H., April 26, 1955).
- Schulman, Samuel**, U.S. rabbi (b. Russia, Feb. 14, 1864—d. New York, N.Y., Nov. 2, 1955).
- Schuyler, Montgomery**, U.S. diplomat and author (b. Stamford, Conn., Sept. 2, 1877—d. Middletown, N.Y., Nov. 1, 1955).
- Schwartz, Henry ("Harry") Herman**, U.S. senator (b. near Fort Recovery, O., May 18, 1869—d. Casper, Wyo., April 24, 1955).
- Scott, Walter Dill**, U.S. educator and psychologist (b. Cookville, Ill., May 1869—d. Evanston, Ill., Sept. 23, 1955), was one of the first to apply psychological principles to personnel, sales, advertising and other problems in industry and commerce. After graduation from Northwestern university, Evanston, Ill., in 1895, he took his Ph.D. in psychology at Leipzig university, Ger. (1900), then returned to Northwestern as associate professor of psychology and education and director of the university's psychological laboratory. He became full professor in 1908 and was president of the university from 1920 until his retirement in 1939. During World War I Scott developed the U.S. army's system of personnel classification of enlisted men for military assignment—a system that was continued with modifications during World War II. He was the author of numerous books and articles dealing with applied psychology.
- Scranton, Worthington**, U.S. industrialist and philanthropist (b. Scranton, Pa., Aug. 29, 1876—d. West Palm Beach, Fla., Feb. 13, 1955).
- Seiberling, Frank A.**, U.S. industrialist (b. Western Star, O., Oct. 6, 1859—d. Akron, O., Aug. 11, 1955), was a pioneer of the U.S. rubber industry, a founder of the Goodyear Tire and Rubber company (1898) and of the Seiberling Rubber company (1921), after he had lost financial control of the Goodyear corporation. Seiberling developed many basic patents in the tire and agricultural implement industries. From 1938 to 1950 he was board chairman of the Seiberling Rubber company.
- Seif-ul-Islam Abdullah**, PRINCE OF YEMEN, government official and diplomat (b. Kefeh, Yemen, 1912—d. Taez, April 14, 1955).
- Sharp, Dorothea**, British painter (b. Dartford, Eng., 1873?—d. London, Eng., Dec. 17, 1955).
- Sharp, Evelyn**, British suffragist and novelist (b. London, Eng., Aug. 4, 1865—d. London, June 21, 1955).
- Sherwood, Robert Emmet**, U.S. author (b. New Rochelle, N.Y., April 4, 1911—d. New York, N.Y., Nov. 14, 1955), first won acclaim with a series of dramatic successes on Broadway in the 1930s and later became one of the most trusted confidants of Pres. Franklin D. Roosevelt and a principal contemporary biographer with his *Roosevelt and Hopkins* (1948). In Sherwood won four Pulitzer prizes, three for plays—*Idiot's Delight* in 1939, *Abe Lincoln in Illinois* in 1939 and *There Shall Be No Night* in 1941—and a 1949 history prize for *Roosevelt and Hopkins*. Sherwood also received Col-

bia university's Bancroft prize for distinguished historical writing in 1949. Sherwood attended Harvard university from 1914 to 1917, and served with the Canadian expeditionary forces during World War I, when he was wounded in France. From 1919 to 1920 he was drama critic of the magazine *Vanity Fair* and from 1920 to 1928 associate editor and then editor of the old *Life* magazine. His first signal success as a playwright was *The Road to Rome* (1927), which was followed by several mediocre plays, then the hit *Reunion in Vienna* (1931) and the above-mentioned Pulitzer prize-winning plays. In 1938 Sherwood helped organize the Playwrights company of producers in New York city. An ardent New Dealer, Sherwood was an early advocate of U.S. intervention in World War II. He was thought to have helped write many of President Roosevelt's major addresses. During World War II Sherwood was overseas director of the office of war information. He was the author of the motion picture play *The Best Years of Our Lives*, accorded the 1946 Academy award as best picture of that year. At the time of his death Sherwood was planning production of his last play, *Small War in Manhattan*.

hetelig, Haakon, Norwegian author and archaeologist (b. 1877—d. Oslo, Nor., July 23, 1955).

hields, Rev. Dr. Thomas Todhunter, Canadian Baptist clergyman (b. Bristol, Eng., Nov. 1, 1873—d. Toronto, Can., April 4, 1955).

hine, The Most Rev. Thomas, British Roman Catholic prelate (b. New Inn, Tipperary, Ire., 1872—d. London, Eng., Nov. 22, 1955).

herras, George Findlay, Scottish economist (b. Aberdeen, Scot., July 16, 1885—d. Rio de Janeiro, Braz., June 23, 1955).

hulman, Harry, U.S. legal educator (b. Krugloye, Russia, March 14, 1903—d. Hamden, Conn., March 20, 1955), emigrated with his parents to the U.S. in 1912 and became a naturalized U.S. citizen in 1921. He took a bachelor's degree at Brown university, Providence, R.I., in 1923 and law degrees at Harvard university in 1926 and 1927. In 1929-30 he was secretary to Supreme Court Justice L. D. Brandeis and in the latter year joined the law faculty of Yale university as an instructor, becoming in 1940 Sterling professor of law and in 1954, dean of the law school. Shulman was an expert in labour law and arbitration and from 1943 until his death was umpire between the Ford Motor company and the Congress of Industrial Organizations' United Automobile Workers.

hultz, Birl E., U.S. economist (b. Union City, Ind., June 8, 1883—d. Northampton, Mass., Nov. 9, 1955).

immons, George Finlay, U.S. educator (b. Sherman, Tex., Oct. 25, 1895—d. Glen Ellyn, Ill., July 19, 1955).

imon, Viscountess (Kathleen Harvey Simon), British slavery crusader (b. County Wexford, Ire.—d. London, Eng., March 27, 1955).

impson, Alfred Dexter, U.S. educator (b. Sheffield, Vt., March 24, 1891—d. Cambridge, Mass., Aug. 25, 1955).

impson, Rev. David Capell, British clergyman and educator (b. May 22, 1883—d. Oxford, Eng., May 6, 1955).

inger, Edgar Arthur Jr., U.S. educator and author (b. Philadelphia, Pa., Nov. 13, 1873—d. Philadelphia, April 3, 1955).

laton, John Marshall, U.S. politician (b. Meriwether County, Ga., Dec. 25, 1866—d. Atlanta, Ga., Jan. 11, 1955).

oan, George A., U.S. business executive and civic leader (b. Nashville, Tenn., May 30, 1893—d. New York, N.Y., May 20, 1955), graduated from Vanderbilt university, Nashville, in 1915 and during World War I was an infantry officer with the American expeditionary forces in Europe. He was a director of several large U.S. corporations, including United States Steel Corp., Goodyear Tire and Rubber Co. and Middle South Utilities, Inc. He was active in many civic enterprises and in national, charitable and trade organizations. From 1941 to 1945 he was president of the Metropolitan Opera association and from Feb. 1946 to March 1955 chairman of the "Met" board of directors. A few days before his death he was elected president of the International Chamber of Commerce, of which he had been a prominent member for years.

nathers, William H(owell), U.S. senator and jurist (b. near Waynesville, N.C., Jan. 7, 1891—d. Asheville, N.C., Sept. 24, 1955).

nith, Bruce, U.S. criminologist (b. Brooklyn, N.Y., May 23, 1892—d. Southampton, N.Y., Sept. 18, 1955).

nith, Sir Keith Macpherson, Australian aviator (b. Adelaide, Austr., Dec. 20, 1890—d. Sydney, Austr., Dec. 19, 1955).

nider, Joseph Lyons, U.S. economist and educator (b. Uniontown, Pa., Aug. 25, 1894—d. Lincoln, Mass., March 4, 1955).

omervell, Brehon Burke, U.S. general (b. Little Rock, Ark., May 9, 1892—d. Ocala, Fla., Feb. 13, 1955), was graduated from the U.S. military academy at West Point, N.Y., in 1914 and was commissioned an officer of engineers. During World War I he served with the 89th division in France and after the war was a supply officer for the U.S. occupation army in Germany. In 1936 he was appointed state administrator of the Works Progress administration in New York. Recalled to active duty with the army in 1940, he was appointed commanding general of the U.S. army service forces during World War II. Under his direction the army spent \$172,000,000,000 to supply more than 8,000,000 men scattered throughout the world and in all theatres of war. Advanced to the rank of full general in the last year of the war, Somervell retired from the army in 1946 and later was elected chairman of the board of Koppers Company, Inc., in Pittsburgh, Pa.

soucek, Apollo, U.S. naval air officer (b. Lamont, Okla., Feb. 24, 1897—d. Washington, D.C., July 22, 1955), graduated from the U.S. naval academy at Annapolis, Md., in 1921, meanwhile having served with the U.S. Pacific fleet in World War I. He became a navy pilot in 1924 and in 1929 established a new world's altitude record for aircraft, 39,140 ft. The next year he boosted the record to 43,166 ft. In World War II Soucek was an air officer during various Pacific naval operations and in the Korean war he commanded a naval task force. Soucek, who was promoted to the rank of rear admiral in 1946, was chief of the U.S. navy bureau of aeronautics from June 1953 to June 1955, shortly before his death.

Sprague, Clifton Albert F., U.S. naval officer (b. Dorchester, Mass., Jan. 8, 1896—d. San Diego, Calif., April 11, 1955).

Sterling, Andrew B., U.S. song writer (b. New York, N.Y., Aug. 26, 1874—d. Stamford, Conn., Aug. 11, 1955).

Sternova, Miroslava, Czech movie actress (b. Czechoslovakia—d. Mexico City, Mex., March 10, 1955).

Stetson, Henry Crosby, U.S. oceanographer (b. Cambridge, Mass., Oct. 10, 1900—d. near Antofagasta, Chile, Dec. 3, 1955).

Stevens, Wallace, U.S. poet and business executive (b. Reading, Pa., Oct. 2, 1879—d. Hartford, Conn., Aug. 2, 1955), studied at Harvard university and at New York law school and was admitted to the New York state bar in 1904. After 12 years of private practice he joined the staff of the Hartford Accident and Indemnity company, Hartford, Conn., becoming a vice-president of that company in 1934. As early as 1914 Stevens had published his first poems (in Harriet Monroe's famed *Poetry* magazine), but his first volume of poetry, *Harmonium*, did not appear until about ten years later. It was followed by *Ideas of Order* (1936), *Owl's Clover* (1936), *Man with the Blue Guitar* (1937), *Parts of a World* (1942), *Notes Toward a Supreme Fiction* (1942), *The Auroras of Autumn* (1950) and *The Necessary Angel* (1951). Stevens was primarily an abstractionist, paying minute attention to metric and tonal qualities of his verse. Honours came rapidly to him in the last decade of his life. In 1949 he received the Bollingen poetry prize of Yale university library; in 1951 the Poetry Society of America's gold medal; in the latter year an honorary degree from Harvard university and the next year from Columbia; and in 1955 the Pulitzer prize for poetry.

Stokes, Frank Wilbert, U.S. artist (b. Nashville, Tenn., 1859?—d. New York, N.Y., Feb. 13, 1955).

Stone, Herbert Lawrence, U.S. editor (b. Charleston, S.C., Jan. 18, 1873—d. New York, N.Y., Sept. 27, 1955).

Storrs, Sir Ronald Henry Amherst, British diplomatist and administrator (b. Bury St. Edmunds, Eng., Nov. 19, 1881—d. London, Nov. 1, 1955).

Stryker, Lloyd Paul, U.S. attorney (b. Chicago, Ill., June 5, 1885—d. New York, N.Y., June 21, 1955), was one of the best-known criminal lawyers of his time. Two of his most celebrated defense cases were those of James J. Hines, Tammany hall leader accused of conspiracy in a New York city "policy game" racket, and of Alger Hiss in his first trial for perjury in connection with treason. The first trial of Hiss in 1949 ended in a split verdict, and Stryker did not represent Hiss in his second trial—which resulted in conviction the next year and a five-year prison sentence. Stryker was an assistant district attorney of New York county from 1910 to 1912. He was the author of four books, including *Andrew Johnson—A Study in Courage* (1929).

Subasic, Ivan, Yugoslav politician of Croatian nationality (b. Vukova Gorica, Croatia, 1892—d. Zagreb, March 23, 1955), was elected to the *skupstina* (lower chamber) in 1935 and re-elected in 1938. After the Serbian-Croatian agreement of Aug. 1939, by which Croatia obtained self-government, Subasic was appointed by Prince Paul, regent of Yugoslavia, to be *ban*, or governor, of Croatia. After the German invasion of 1941 he went to the United States, remaining loyal to King Peter II. In June 1944, at the instigation of Winston Churchill, King Peter appointed him prime minister of the Yugoslav government in exile. His mission was to reach agreement with Marshal Tito, with the vain hope of saving the monarchy. In March 1945, in Belgrade, Subasic joined as foreign minister a cabinet headed by Marshal Tito. He resigned six months later.

Sullivan, Henry F., U.S. swimmer (b. 1891—d. Beverly, Mass., Dec. 23, 1955).

Summerall, Charles Pelot, U.S. general (b. Lake City, Fla., March 4, 1867—d. Washington, D.C., May 14, 1955), graduated from the U.S. military academy at West Point, N.Y., in 1892. He took part in the Philippine campaigns of 1899-1900 and served in China during the Boxer rebellion in 1900. After acting as U.S. military observer to British and French armies on the western front in 1917 during World War I, Summerall was placed in successive command of three U.S. army corps after U.S. entry into the war, earning a reputation as a foremost expert on artillery and winning the distinguished service cross for gallantry at the battle of Soissons. From 1926 to 1930 Summerall was U.S. army chief of staff, being advanced to the rank of full general in 1929. After his retirement in 1931 he became president of the Citadel, military college at Charleston, S.C., and served in this position for 22 years, until 1953.

Sumner, James Batcheller, U.S. biochemist (b. Canton, Mass., Nov. 19, 1887—d. Buffalo, N.Y., Aug. 12, 1955).

Sutherland, Lady Millicent Fanny St. Clair-Erskine, DUCHESS OF, British author (b. Oct. 20, 1867—d. Biarritz, Fr., Aug. 20, 1955).

Suydam, Henry, U.S. journalist and government official (b. Brooklyn, N.Y., May 19, 1891—d. Washington, D.C., Dec. 11, 1955).

Swinderen, Rene de Marees van, Jonkheer, Dutch diplomat (b. Groningen, Neth., Oct. 6, 1860—d. London, Eng., Jan. 17, 1955).

Szekfely, Gyula, Hungarian historian (b. Szekesfehervar, May 23, 1883—d. Budapest, June 28, 1955).

Tambarini, José P., Argentine politician (b. Buenos Aires, Arg., Feb. 22, 1886—d. Buenos Aires, Sept. 25, 1955).

Tanguy, Yves, French-U.S. Surrealist painter (b. Paris, Fr., Jan. 5, 1900—d. Waterbury, Conn., Jan. 15, 1955), studied in Paris and became a leading member of the Surrealist school there in the 1920s. He emigrated to the United States in 1939 and became a naturalized citizen of the U.S. nine years later. His paintings were hung in leading museums of Paris and the United States and elsewhere.

Tarlé, Eugene V., Soviet historian (b. 1875?—d. Moscow, U.S.S.R., Jan. 6, 1955).

Taylor, William Osgood, U.S. editor and publisher (b. Nashua, N.H., Jan. 8, 1871—d. Marion, Mass., July 15, 1955).

Teilhard de Chardin, Rev. Pierre, French Jesuit, scientist and explorer (b. Orcine [Puy-de-Dôme], Fr., May 1, 1881—d. New York, N.Y., April 10, 1955).

Templeton, Charles Augustus, U.S. politician (b. Sharon, Conn., March 3, 1871—d. Waterbury, Conn., Aug. 15, 1955).

Themeles, Timotheos, Greek Orthodox patriarch (b. Samos, 1878—d. Jerusalem, Dec. 31, 1955), was ordained in 1905 and, after a short period of further training at Oxford, was made archimandrite in 1914. In 1921 he was elected archbishop of Jordan and four years later went to London with Patriarch Damianos for the Nicaean celebrations. The question of succession to Damianos, who died in 1931, was hotly debated between the rival factions of the Fraternity of the Holy Sepulchre and the laity of the patriarchate and it was not until 1935 that Timotheos was elected patriarch of Jerusalem by only nine votes over Patriarch Meletios of Alexandria. In his later years Archbishop Timotheos suffered from Parkinson's disease and was unable to take part in public ceremonies; he continued, however, to formulate policy and attend synod meetings.

Thorpe, Merle, U.S. editor (b. Brimfield, Ill., Nov. 1, 1879—d. Washington, D.C., Oct. 31, 1955), took bachelor's degrees from Stanford university, Stanford, Calif., and the University of Washington, Seattle. He taught journalism at the latter university (1907-11) and the University of Kansas, Lawrence (1911-16), meanwhile working on various newspapers. From 1916 until 1944 he was editor of *The Nation's Business*, national magazine of the U.S. chamber of commerce. In 1944 he was appointed director of business development for the Cities Service oil company. Thorpe was one of the first economic analysts to popularize news of U.S. business trends.

Thurstone, Louis Leon, U.S. psychologist (b. Chicago, Ill., May 29, 1887—d. Chapel Hill, N.C., Sept. 29, 1955).

Tillmanns, Robert, German politician (b. Wuppertal-Barmen, Ger., April 5, 1896—d. Berlin, Ger., Nov. 12, 1955).

Tobin, Daniel J., U.S. labour executive (b. Ireland, 1875—d. Indianapolis, Ind., Nov. 14, 1955), was one of the most influential U.S. labour leaders of the first half of the 20th century. The union of which he was president from 1907 until his retirement in 1952—the International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers—became the most powerful component of the American Federation of Labour (of which Tobin was also an executive council member). Emigrating from Ireland to the United States in 1889, Tobin became a teamster in Boston, Mass., and soon was active in union affairs. During his 45 years as head of the teamsters union he vehemently defended the union against periodic charges of alleged racketeering. A close friend of Pres. Franklin D. Roosevelt, Tobin helped raise money for the four Roosevelt presidential campaigns and was mentioned on several occasions as a potential secretary of labour in both the New Deal and Fair Deal administrations. When Tobin refused to accept re-election as head of the teamsters union in 1952 he was succeeded by the executive vice-president, Dave Beck, and made president emeritus.

Tokuda, Kyuichi, Japanese communist leader (b. Okinawa, Sept. 12, 1894—d. Peiping, China, Oct. 24, 1953, announced July 29, 1955).

Towers, John Henry, U.S. naval officer and aviation pioneer (b. Rome, Ga., Jan. 30, 1885—d. New York, N.Y., April 30, 1955), graduated from the U.S. naval academy at Annapolis, Md., in 1906, was commissioned ensign two years later, subsequently advanced to the rank of vice-admiral (1942) and retired as admiral in 1947. A pioneer U.S. navy flier, he was assistant director of naval aviation in World War I, and in 1919 piloted one of three navy planes that attempted the first transatlantic flight, from Newfoundland to England. Towers and his crew were forced to land west of the Azores Islands, to which they water-taxied, but another plane in the flight went on to complete the first Atlantic crossing by air. This success was an early step in the long fight which Towers spearheaded to gain acceptance of the aeroplane by the navy. In 1939 Towers was named chief of the bureau of aeronautics, and from 1942 to 1944 he was commander of the U.S. Pacific fleet's air force. In the latter year he became deputy commander in chief, and in 1945 commander in chief, of the Pacific fleet. After his retirement from the navy he was a vice-president of Pan American World Airways.

Townsend, Rev. Henry, British Baptist clergyman (b. Nottinghamshire, Eng.—d. Carshalton Beeches, Eng., July 2, 1955).

Tribhuvan Bir Bikram, king of Nepal (b. Kathmandu, June 30, 1906—d. Zürich, March 13, 1955), came to the throne on Dec. 11, 1911. In theory a divine ruler he was in fact powerless against the prime ministers of the oligarchic Rana family. In Nov. 1950 he sought refuge in India and his grandson of three was placed on the throne, but the country was invaded by Nepali Congress party supporters, gaining the sympathy of India. Jawaharlal Nehru, the Indian prime minister, advocated constitutional reforms and on Feb. 15, 1951, the king returned as a constitutional monarch to rule with a mixed cabinet of both the Rana family and the Congress party. Since the power of the Ranas was not easily broken the cabinet proved unworkable

and following a state of emergency in July 1952 the king reluctantly resumed direct rule with five advisers. In September he agreed with Nehru on further democratic reforms. On June 15, 1953, he re-established a coalition cabinet headed by M. P. Koirala, leader of the new National Democratic party. The cabinet was denounced by the Congress party as unrepresentative and was reorganized after negotiations. Meanwhile the king asserted by proclamation his supreme authority in defiance of the supreme court's ruling. Heart disease brought him to Europe for treatment and in Feb. 1955 he provisionally invested his son, the crown prince, with royal authority. The latter resumed direct rule on March 2.

Troyanovsky, Alexander Antonovich, Russian diplomat (b. Tula, Russia, Jan. 1, 1882—d. Moscow, U.S.S.R., June 23, 1955).

Turkin, Hy, U.S. sports writer (b. New York, N.Y., May 9, 1915—d. New York, June 24, 1955).

Turner, Kenneth Burden, U.S. cardiologist (b. Lynchburg, Va., Jan. 29, 1901—d. New York, N.Y., Oct. 9, 1955).

Utrillo, Maurice, French painter (b. Paris, Fr., Dec. 26, 1883—d. Dax, Basses Pyrénées, Nov. 5, 1955), took the name of a Spanish journalist who legally adopted him; however, he often signed pictures with his mother's name Suzanne Valadon, or later, "Utrillo-Valadon" or "Utrillo-V." His life as a drunkard and drug addict began before he was in his teens, his career as a painter not until 1903, when, after he had been dismissed from a bank and had received treatment for dipsomania, a doctor suggested that learning to paint might benefit him. His mother gave him a palette and some lessons in technique, and in his first period (1903-08) he was influenced by the Impressionists, particularly in his handling of pigment. Typical of this period is "Le Pont Saint Michel." Gradually, however, he developed a strong, sure style of his own, which showed no sign of his mental and physical deterioration. He worked mostly out of doors and excelled in transmitting the serene yet melancholy atmosphere peculiar to Montmartre. In such pictures as "Notre-Dame pavoisée," "La Place Jean-Baptiste Clément" and "Le Square Saint Pierre sous la neige" his "tragic" skies and the depth of his shadow give his whites a disturbing, luminescent brightness. His output in his most productive years was immense; he painted at the rate of one and a half pictures a day, working in the evenings from picture postcards, particularly of churches. His first one-man show was given in 1913, and in 1919 an exhibition of his work during 1910-15 confirmed his reputation. Meanwhile, his feverish creative activity was increasingly interrupted by periods of depression and alcoholism. His mother's spasmodic attempts to cure him led to visits to Corsica and Brittany (1912-13) from which he returned with a number of pictures lighter and less intense in tone. After moving to a chateau near Lyons in 1923, his style became drier and more austere, his colour gayer, clearer and simpler. In 1929 he received the Cross of the Legion of Honour. He married in 1935 and subsequently lived in retirement.

Vachell, Horace Annesley, British novelist and playwright (b. Essex, Eng., Oct. 30, 1861—d. Bath, Eng., Jan. 10, 1955).

Vail, Richard Bernard, U.S. manufacturer and congressman (b. Chicago, Ill., Aug. 31, 1895—d. Chicago, July 29, 1955).

Van Ingen, William Brantley, U.S. artist (b. Philadelphia, Pa., 1858—d. Utica, N.Y., Feb. 6, 1955).

Villanueva, José Gavino, Bolivian physician and politician (b. 1877—d. La Paz, Bol., March 25, 1955).

Vollmer, August, U.S. criminologist (b. New Orleans, La., March 7, 1876—d. Berkeley, Calif., Nov. 4, 1955).

Vukovich, Bill, U.S. automobile racer (b. Alameda, Calif., 1918?—d. Indianapolis, Ind., May 30, 1955), was one of only three men in history to win the Indianapolis 500-mi. speedway race twice in succession—1953 and 1954. He had begun midget-car racing in 1938 and twice won the Pacific Coast midget championship (1946 and 1947). His first appearance at the 500-mi. race was in 1951, when he was forced to drop out after 29 laps because of mechanical difficulties. In 1952 he was again forced to withdraw from the race, while he was in the lead. The next two years he finished first. Vukovich was killed in the 1955 Indianapolis race, while again in the lead, his car hitting a retaining wall of the track after 140 mi.

Wade, Herbert Treadwell, U.S. editor and author (b. New York, N.Y., Sept. 2, 1872—d. New Canaan, Conn., March 18, 1955).

Wagner, John P. (Honus), U.S. baseball player (b. Carnegie, Pa., Feb. 24, 1874—d. Carnegie, Pa., Dec. 6, 1955), was generally considered the greatest shortstop in U.S. baseball history and was one of the first five stars elected to the baseball hall of fame at Cooperstown, N.Y. in 1936—the others being Ty Cobb, Babe Ruth, Walter Johnson and Christy Mathewson. The "Flaming Dutchman," as Wagner was called, entered minor league baseball at Steubenville, O., in 1895 and two years later was in major league ball with the old Louisville (Ky.) Colonels, then a member team of the National league. After reorganization of the league in 1900 Wagner went to Pittsburgh and remained with the Pirates the rest of his major league playing career, which ended with his retirement in 1917. In 1933 he was appointed a Pirate coach. Wagner's lifetime batting average was .328 and he led the National league in batting for eight years—more than any other league player; his top year was 1900 (.380). Other National league records still held by Wagner at the time of his death were: hitting above .300 the most years (17); playing the greatest number of games (2,785), making the most hits (3,430) and scoring the most runs (1,740).

1955 OBITUARIES: Alexandros Papagos, Greek statesman; Robert E. Sherwood, U.S. author; Charles P. Summerall, U.S. general; Maurice Utrillo, French painter; John P. (Honus) Wagner, U.S. baseball player

- Walker, Rollin Hough**, U.S. educator and author (b. Columbus, O., Dec. 19, 1865—d. Delaware, O., Aug. 4, 1955).
- Walsh, J. Brandon**, U.S. song writer and cartoonist (b. Chicago, Ill., May 10, 1882—d. New York, N.Y., Jan. 13, 1955).
- Walton, Sir Albert James**, British surgeon (b. London, Eng., Nov. 1, 1881—d. Sussex, Eng., Aug. 27, 1955).
- Wambaugh, Sarah**, U.S. plebiscite authority (b. Cincinnati, O., March 6, 1882—d. Cambridge, Mass., Nov. 12, 1955).
- Ward, Arch**, U.S. sports writer and editor (b. Irwin, Ill., Dec. 27, 1896—d. Chicago, Ill., July 8, 1955), graduated from Notre Dame university, Ind., and was sports editor of newspapers in Dubuque, Ia., and Rockford, Ill., before joining the staff of the *Chicago Tribune* in 1925. He became sports editor of that paper in 1930. Ward originated the annual all-star baseball game in 1933, at the time of A Century of Progress exposition in Chicago, and the annual all-star football game the next year. He was also promoter of the international Golden Gloves boxing tournament. Ward was the author of several books and appeared frequently on television sports programs.
- Warner, Longdon**, U.S. art curator (b. Cambridge, Mass., Aug. 1, 1881—d. Cambridge, June 9, 1955).
- Weaver, Harrison J. ("Doc")**, U.S. athletic trainer (b. Miamisburg, O., March 30, 1886—d. St. Louis, Mo., May 21, 1955).
- Wedgwood, Camilla Hildegard**, Australian anthropologist (b. Newcastle-on-Tyne, Eng., March 25, 1901—d. Sydney, Austr., May 17, 1955).
- Wertenbaker, Charles Christian**, U.S. author and journalist (b. Lexington, Va., Feb. 11, 1901—d. Cibour, Fr., Jan. 8, 1955).
- West, Charles**, U.S. congressman (b. Mt. Vernon, O., Jan. 12, 1895—d. Bradenton, Fla., Dec. 27, 1955).
- Weyl, Hermann**, German-U.S. mathematician (b. Elmshorn, Ger., Nov. 9, 1885—d. Zurich, Switz., Dec. 8, 1955).
- White, Paul W.**, U.S. editor and director (b. Pittsburg, Kans., June 9, 1902—d. San Diego, Calif., July 9, 1955).

White, Walter (Francis), U.S. Negro leader (b. Atlanta, Ga., July 1, 1893—d. New York, N.Y., March 21, 1955), had only a small proportion of Negro blood, but elected as a youth to identify himself with advancing the cause of civil, political and economic rights for U.S. Negroes. He graduated from Atlanta university, Atlanta, Ga., in 1916 and two years later was named assistant secretary of the National Association for the Advancement of Colored People. In 1929 he became acting secretary and in March 1931 secretary of the organization. In this office he spearheaded such important drives as that which led to establishment of the fair employment practices committee of Pres. Franklin D. Roosevelt in June 1941. He was also instrumental in securing the Democratic party's adoption of a strong civil rights platform for minority groups during the presidential campaign of 1948 in the face of unyielding Dixiecrat opposition in the southern states. White was a determined publicist for national antilynching legislation and other civil rights measures. He held a number of appointive posts, including those of consultant to the United Nations organizing conference at San Francisco, Calif., in 1945 and adviser to the Virgin Islands government in 1934-35. Among his published works were two novels and an autobiography, *A Man Called White* (1948). He was Spingarn medalist in 1937.

- White, William Chapman**, U.S. foreign correspondent and author (b. Reading, Pa., Feb. 20, 1903—d. Washington, D.C., Nov. 28, 1955).
- Whiteley, William**, British politician (b. Elland, Eng., Oct. 3, 1882—d. Durham, Eng., Nov. 3, 1955).
- Wieczorek, Max**, U.S. artist (b. Breslau, Ger., Nov. 22, 1863—d. Pasadena, Calif., Sept. 25, 1955).
- Wilcox, Herbert B.**, U.S. pediatrician (b. Brooklyn, N.Y., July 1, 1874—d. Lake Charles, La., Feb. 1, 1955).
- Wilcox, Robert**, U.S. actor (b. Rochester, N.Y., May 19, 1910—d. Rochester, June 11, 1955).
- Wildman, Clyde Everett**, U.S. educator (b. Greensburg, Ind., March 8, 1889—d. Carlisle, Pa., Nov. 1, 1955).
- Willard, Gerald Warner**, U.S. physicist (b. Mankato, Minn., June 19, 1901—d. Fanwood, N.J., Nov. 18, 1955).
- Williams, Horatio Burt**, U.S. physiologist (b. Utica, N.Y., Sept. 17, 1877—d. New York, N.Y., Nov. 1, 1955).
- Wilson, Bert (Bert Mison Puckett)**, U.S. radio announcer (b. Columbus, O., Feb. 5, 1911—d. Mesa, Ariz., Nov. 5, 1955).

Wolgast, Adolf (Ad), U.S. boxer (b. Cadillac, Mich., Feb. 8, 1888—d. Camarillo, Calif., April 14, 1955), won the lightweight championship of the world from Battling Nelson in Feb. 1910 and kept the title until Nov. 1912, when he was defeated by Willie Ritchie. Wolgast won 85 of 145 bouts during his career.

- Wolgast, Midget (Joseph Robert Loscalzo)**, U.S. boxer (b. Philadelphia, Pa., 1909—d. Philadelphia, Oct. 19, 1955).
- Wood, Paul Spencer**, U.S. educator (b. Chicago, Ill., July 12, 1882—d. Madison, N.J., Jan. 11, 1955).

Wood, Robert Williams, U.S. physicist (b. Concord, Mass., May 2, 1868—d. Amityville, N.Y., Aug. 11, 1955), was a leading authority on spectroscopy, optics and supersonics. Graduating from Harvard university in 1891, he studied further at Johns Hopkins university, Baltimore, Md., at The University of Chicago, and at the University of Berlin, Ger. From 1901 until his retirement in 1938 he taught at Johns Hopkins and subsequently was research professor there. During World Wars I and II he was engaged in research for the U.S. armed forces—notably the Manhattan project that developed the atomic bomb.

- Woodward, William Jr.**, U.S. financier and sportsman (b. New York, N.Y., June 12, 1920—d. Oyster Bay, N.Y., Oct. 30, 1955).
- Wormser, Isaac Maurice**, U.S. educator and lawyer (b. New York, N.Y., May 26, 1887—d. New York, Oct. 22, 1955).
- Wyman, Phillips**, U.S. publisher (b. Evanston, Ill., May 24, 1895—d. Redding, Conn., May 27, 1955).

Ylla (Camilla Koffler), U.S. photographer (b. Vienna, Aus., 1911?—d. Bharatpur, India, March 30, 1955).

Young, Denton True (Cy), U.S. baseball player (b. Gilmore, O., March 29, 1867—d. Newcomerstown, O., Nov. 4, 1955), was one of the greatest pitchers of U.S. baseball history. Among all-time records set by him were the most games pitched, 906 between 1890 and 1911 in the major leagues; most games won, 511, and most consecutive innings pitched in four games without allowing a hit, 23. For 14 straight years (1891-1904) Young won 20 or more games annually, and in five seasons he won 30; his best record was in 1892 with 36 wins and 10 losses, for the Cleveland Nationals, his third season in the majors. Young also pitched for four other major league teams—St. Louis (National league), 1899-1900; Boston (American), 1901-08; Cleveland (American) 1909-11; and Boston (National), the rest of 1911. His career record of strikeouts (2,836) was second only to that of Walter Johnson (3,479). In 1937 Young became the third pitcher to be elected to the baseball hall of fame at Cooperstown, N.Y.

Young-Hunter, John, U.S. artist (b. Glasgow, Scot., Oct. 29, 1874—d. Taos, N.M., Aug. 9, 1955).

Occupational Diseases: see INDUSTRIAL HEALTH.

Oceanography. Plans for oceanographic participation in the International Geophysical year, 1957-58, were discussed during a meeting held in Brussels, Belg. It was reported that about 40 vessels of many nations would participate in the program. The program would aim primarily at a better understanding of the relationships between the movements of the ocean's deep water masses and long- or short-range climatic trends. Reports of extensive Russian explorations in the Central Arctic basin and the promise of a considerable number of ships during the International Geophysical Year made it evident that there was considerable oceanographic activity in the U.S.S.R.

Based on an analysis of available data, an extensive report showed that annual and semiannual fluctuations in world-wide sea level vary from an inch or so in the tropics to about half a foot in high latitudes. It was suggested that the extensive tidal observations to be made in 1957-58 would aid in the understanding of the relationship between sea level fluctuations and departures from the mean water circulation in the oceans, and that such observations may be a guide to the solution of many unsolved problems in dynamic oceanography.

Studies of the Gulf stream system showed the existence of a large-scale semipermanent anticyclonic eddy in the Gulf of Mexico, while an analysis of the oxygen-density relationships confirmed the hypothesis of the multiple current theory (F. C. Fuglister, 1951) and the existence of significant fluctuations in the Florida current, south of Cape Hatteras. The method also allows tracing the source of some water in the Gulf stream system, when this cannot be done on the basis of temperature and salinity observations. It was also shown that the multiple current hypothesis is applicable to the Japan current and that the "river in the sea" idea can often be misleading. A plea was made for a nomenclature of multiple currents in the major circulation systems, and it was suggested that the name "Gulf stream" should not be used in reference to a particular current observed at a particular time.

The rate at which the ocean water masses "turn over" had been studied during recent years by measurement of the decay of radiocarbon (C^{14}) and of the consumption of oxygen in deep water. Radically different orders of magnitude were obtained by the two methods. A knowledge of the rate of overturn becomes more and more desirable not only for the study of climatic trends but also to determine if the ocean, or parts of the ocean, can be used safely for the disposal of atomic wastes. Additional deep oxygen and temperature observations made during 1954 and 1955 and compared with those made 30 years before in the northwestern Atlantic confirmed the conclusion that little or no deep water was formed in high latitudes during recent years and that the bulk of Atlantic deep water was formed about 140 years ago. A re-evaluation of observations of

the German "Meteor" expedition also showed that Atlantic bottom currents are not insignificant.

While the entire ocean, therefore, may turn over in a comparatively short period of time, there are some local areas which have not been "stirred" for a long period and where the subsurface water is devoid of oxygen. The Black sea and some threshold fiords are notable examples of such regions. A new basin of stagnant water was discovered in the Caribbean sea; the Cariaco trench, just north of Venezuela, was found to be anaerobic from about 1,600 ft. below the sea surface to the bottom at about 4,500 ft.

Observations of tidal currents in the deep sea became possible by electropotential measurements through submarine cables to Bermuda, the Azores and Turks Island. The lack of correlation between some observations and the magnitude to be expected from tidal theory was thought to be due to the impossibility of including the complex geometry of the ocean basins in a theoretical treatise. Although this is true also for the theory on transient ocean currents, the latter was significantly advanced by workers in Japan, Germany and the United States.

Four great bands of extremely irregular topography, named fracture zones, were discovered in the northeast Pacific basin. Covering about 5% of the earth's surface, the fracture zones are roughly parallel at right angles to the west coast of North America and range in length from 1,400 to 3,300 mi. while averaging 60 mi. in width. The zones were named, respectively, the Mendocino, Murray, Clarion and Clipperton escarpments.

Seismic explorations made at sea during recent years showed an absence of continental-type rock structure beneath the North Atlantic ocean. A new method showed that the properties of the suboceanic crust can be deduced from an examination of earthquake surface waves. No evidence was found of a submerged land mass of continental type, character and dimensions, under the Pacific ocean and under the Arctic basin and adjacent seas. Other seismic studies revealed that New Zealand and other islands in the southwest Pacific are not continental in character but have built up with succeeding geologic time on an oceanic crust.

Important problems to be attacked were discussed at several conferences in the U.S. The possibility of the disposal of atomic wastes at sea, the influence of sea-salt nuclei on rainfall and the problem of east coast hurricanes demand early solutions. A prediction of sea levels associated with the path of hurricanes on the eastern coast of the U.S. was developed during the year. The most dangerous point for high-water levels is roughly 50 to 100 mi. to the right (as viewed from the ocean) of the hurricane centre when it crosses the coast line. (See also COAST AND GEODETIC SURVEY, U.S.; ELECTRONICS; INTERNATIONAL GEOPHYSICAL YEAR, 1957-58; MARINE BIOLOGY.)

Ohio. A north central state of the United States, popularly known as the "Buckeye state," Ohio became a state of the union in 1803, but because there was some question about the formality of the action, the U.S. congress in 1953 jestingly went through the motions of formally admitting the state to the union. Area: 41,222 sq.mi., including 222 sq.mi. of water. Pop. (1950 census): 7,946,627, including 5,578,274 urban and 2,368,353 rural; 6,566,531 white and 1,380,096 nonwhite. As of July 1, 1955, the U.S. bureau of the census estimated the population to be 8,946,000. The principal cities and their 1950 population figures are: Cleveland, 914,808; Cincinnati, 503,998; Columbus, 375,901; Toledo, 303,616; Akron, 274,605; Dayton, 243,872; Youngstown, 163,330; and Canton, 116,912.

History.—Just after midnight on Oct. 1, 1955, Gov. Frank J. Lausche of Ohio formally opened the Ohio turnpike with ceremonies at its western terminus near the Indiana border. This \$326,000,000 twin highway stretches 241 mi. across the northern section of the state and links up with the Pennsylvania turnpike. A 22-mi. section of the Ohio turnpike, extending from the Pennsylvania turnpike to the Youngstown area, had been opened earlier. With completion of the Indiana turnpike, the chain of toll roads would extend from the vicinity of New York city to the vicinity of Chicago, Ill.

An impressive list of legislation was enacted by the 101st Ohio general assembly which was in session from January to July. At the top of the list of accomplishments was the passage of bills to lay the foundation for a mental health program which was expected to modernize the state's antiquated mental health procedures. One part of this set up a \$10,000,000-a-year training program for psychiatrists and institutional personnel at new centres affiliated with medical colleges in Cleveland, Columbus and Cincinnati. Another milestone was the establishment of a 23-member elected state school board and a new formula for distribution of school subsidy funds.

Other important enactments of the general assembly included: authorized formation of port authorities, looking forward to increased Great Lakes shipping trade with the opening of the St. Lawrence seaway; released \$250,000,000 for repair and construction of main highways; put sharp teeth in laws regulating sale of narcotics; created a new state board of nursing; tightened laws on sickness and accident insurance; approved sale of "multiple line" insurance; dropped the names of presidential electors from the Ohio ballot; raised salaries of various state officials, the governor's salary going to \$25,000 a year; ordered submitted to voters at the Nov. 1956 election a \$90,000,000 bond issue to provide bonus payments for Ohio veterans of the Korean war; permitted sale of bulk milk from refrigerated dispensers and the use of nonnutritive sweeteners in soft drinks; created six additional municipal courts; established new common pleas judgeships in nine counties; retained but modified the controversial axle-mile tax on commercial trucks.

In November Ohio voters went to the polls in record numbers for an "off-year" election. What excited their interest was a bill initiated by petition which would have increased Ohio unemployment compensation payments from \$33 a week for 26 weeks to a maximum of \$50 a week for 39 weeks. It also would have made other changes in the law so it would conform to the supplemental layoff pay plans negotiated by the C.I.O. United Automobile Workers' union with the Ford Motor Co. and General Motors Corp. This initiated proposal was defeated, receiving

only 37% of the votes cast.

A constitutional amendment to authorize a \$150,000,000 bond issue for mental health institutions, schools and state buildings to be financed by an additional penny-a-pack tax on cigarettes was approved by a margin of about 250,000 votes. Two other proposed constitutional amendments were defeated. They would have authorized higher salaries for judges and certain state and county officials. Voters also elected the 23 members of the new state board of education.

State officials in 1955, in addition to Governor Lausche, a Democrat who was serving his fifth term, included: John W. Brown (Rep.), lieutenant governor; Ted W. Brown (Rep.), secretary of state; Roger W. Tracy (Rep.), treasurer; C. William O'Neill (Rep.), attorney general; James A. Rhodes (Rep.), auditor.

Education.—In 1955 the state had 2,945 elementary public schools with total enrolment (excluding kindergarten) of 1,015,619 and a teaching staff of 32,043; 130 junior high schools with an enrolment of 88,725 and a teaching staff of 3,521; 1,004 senior high schools with an enrolment of 61,097 and a teaching staff of 18,325. There were 1,137 kindergarten classes in public schools with an enrolment of 103,563 and a teaching staff of 1,708. The number of private and parochial elementary schools in Ohio in 1955 was 635 with an estimated total enrolment of 226,333 and a teaching staff of 4,950; 153 senior high schools with an enrolment of 47,884 and a teaching staff of 2,389; 195 kindergarten classes with an estimated enrolment of 5,480 and an estimated teaching staff of 200. Expenditures in Ohio for education in 1955 approximated \$350,000,000. The Ohio superintendent of public instruction was Reina Merle Eymann.

Social Insurance and Assistance, Public Welfare and Related Programs.—The average number of recipients of general relief per month in the fiscal year ended June 30, 1955, was 37,661 and the total assistance extended was \$32,618,729. The average number per month receiving aid for the aged was 103,093, and they received \$71,166,196; aid to dependent children, 14,735 cases received a total of \$16,375,915; aid to the blind, 7,700 cases received a total of \$2,498,805; aid for the disabled, 7,760 cases received a total of \$4,584,913. Benefits paid by the Ohio bureau of unemployment compensation in the fiscal year ended June 30, 1955, totalled \$100,633,421 in compensation for 3,627,550 weeks of unemployment.

Ohio's correctional institutions had an average daily population of 6,109 for the fiscal year ended June 30, 1955. The industrial training schools had an average daily population of 1,332. Hospitals for the mentally ill had an average daily population of 28,367 and state schools for the retarded 7,521. Total cost of operating the correctional institutions for the fiscal year was \$7,861,197; industrial training schools, \$2,334,922; hospitals for the mentally ill, \$29,323,387; schools for the retarded, 6,691,018.

Communications.—Ohio had 82,162 mi. of highways in 1955 outside municipalities. Of this total, 16,002 mi. were classified as state, 28,753 mi. as county and 37,407 mi. as township. Total state expenditures on highways in the fiscal year ended June 30, 1955, were \$149,727,329 which included \$8,556,452 expended for the operation of the state highway patrol and the licence bureau.

In 1955 Ohio had 174 airports and landing fields certified for commercial operation and 238 uncertified fields. The state had 8,419 mi. of railroads and 2,793,751 telephones.

Banking and Finance.—There were 400 state and private banks in Ohio with deposits (June 30, 1955) of \$5,107,395,827 and resources of \$5,608,107,372. There were 233 active national banks in the state with deposits (June 30, 1955) of \$4,537,223,000 and resources of \$4,917,472,000.

State-chartered savings and loan institutions numbered 460 with total resources (June 30, 1955) of \$2,286,784,182. There were 135 federal savings and loan associations with total assets (Dec. 31, 1954) of \$1,335,290,043.

Manufacturing.—The total value added by manufacture in Ohio in 1953 was estimated at \$11,192,103,000 in the annual survey of manufactures made by the bureau of census of the U.S. department of commerce, as compared with \$10,033,105,000 in 1952. Average weekly earnings of production workers in Ohio manufacturing reached a high of \$86.70 in July, 1955. Ohio had more than 12,000 industrial establishments which employed more than 1,400,000 workers. (P. By.)

Oklahoma. A west south central state of the United States, Oklahoma was admitted as the 46th state on Nov. 16, 1907. The name "Oklahoma" is from the Choctaw Indian words meaning "red people" and was first applied to the Indian territory in 1866. The popular name "Sooner state" was from the term "sooner" used in reference to a person who entered and staked a claim sooner than the law stipulated when the first public lands in the Indian territory were opened to white settlement, April 22, 1889. Area: 69,919 sq.mi., including 900 sq.mi. of water surface (artificial lakes and rivers). Pop.: (1950 census) 2,233,351; (July 1, 1955, est.) 2,136,000. The two largest cities (1950 census) are Oklahoma City, the capital, 243,504, (1954 est.) 353,000; and Tulsa, 182,740 (1954 est.) 212,753. Other cities are (1950 pop.) Muskogee, 37,289; Enid, 36,017; Lawton, 34,757; Norman, 27,006; Shawnee, 22,948; Stillwater, 20,238; Ponca City, 20,180; Bartlesville, 19,228; Okmulgee, 18,317; Ardmore, 17,890; McAlester, 17,878; Ada, 15,995; Chickasha, 15,842.

History.—The 25th state legislature meeting in 1955 estab-

lished a new state department of commerce and industry to expand the program of balancing Oklahoma's agricultural economy with a variety of industries which had been steadily developing and now included recently established plants for the manufacture of jet bombers, petrochemical products, plate glass and textiles. The 25th state legislature also passed two important acts for eventually solving the water problem in the state: one act allows cities and towns to pool their resources and enter into long-range contracts to build and operate water facilities; the other established a state water study commission to survey water supplies and needs.

The state regents of higher education voted to abolish the segregation of Negroes in the University of Oklahoma, Norman; Oklahoma Agricultural and Mechanical college, Stillwater; and 15 other state educational institutions, effective June 5, 1955. The state department of education reported in September that 258 public schools were integrated with mixed classes of Negro and white students.

The chief state officers during 1955, all Democrats, elected on Nov. 2, 1954, were Raymond Gary, governor; Cowboy Pink Williams, lieutenant governor; Andy Anderson, secretary of state; A. S. J. Shaw, state auditor; Mac Q. Williamson, attorney general; John D. Conner, state treasurer; Oliver Hodge, superintendent of public instruction.

Education.—The total enrolment in Oklahoma public schools (est. Oct. 1955 by department of education) for the term 1954-55 was 529,880 (elementary and high schools) with 20,075 teaching personnel. The total cost of maintaining the elementary and high schools in the state was tentatively given as \$100,327,543 for current expenses. State institutions of higher learning included the University of Oklahoma and the Oklahoma Agricultural and Mechanical college, both graduate schools, and Oklahoma College for Women (Chickasha), Panhandle Agricultural and Mechanical college (Goodwell), Langston university (Negro, at Langston) and six colleges for teacher training (Ada, Alva, Durant, Edmond, Tahlequah, Weatherford), all state-owned senior colleges. There were 16 two-year junior colleges, of which 7 were state-owned (including the Oklahoma Military academy, Claremore), 3 were independent with church affiliations and 6 were municipal. There were also six independent senior colleges with church affiliations.

Social Insurance and Assistance, Public Welfare and Related Programs.—On Jan. 1, 1955, the Oklahoma department of public welfare reported 95,455 old-age assistance cases receiving an average of \$61.57 per case (a total of \$5,877,414); 15,798 dependent children cases (representing 54,882 persons), each case receiving an average of \$77.15 (a total of \$1,218,768); 2,037 blind cases receiving an average of \$73.65 (a total of \$150,350); 5,934 disabled cases, each case receiving an average of \$58.54 (a total of \$347,402). On Oct. 1, 1955, the state department of public health reported 48 counties of the 77 counties in Oklahoma with full-time health departments and 41 counties under full-time medical service, these programs rendering service to 85% of the state's population. These services now included the Indian population in Oklahoma, because of the change of this health program from the U.S. bureau of Indian affairs to the state department of health in 1955. State-supported institutions included two tuberculosis sanatoria, one general hospital, four mental hospitals, two schools for mental defectives, two schools for deaf and blind, two training schools, one reformatory and one penitentiary.

Communications.—The summary of disbursements by the state highway commission for construction and maintenance was \$24,980,153.77 in the period Jan. 1, 1955, to Sept. 1, 1955. The highway department was responsible for a highway system of 10,433 mi. in the state as of Jan. 1, 1955. The total public open road mileage in Oklahoma was approximately 93,147. Railroad and electric mileage approximated 6,000, not including sidings, representing a network of 16 railway systems extending to 76 counties in the state. There were 15 cities served by five major air lines in Oklahoma.

Banking and Finance.—The state budget office reported expenditures for the state at \$310,004,985.74 (federal and state expenditures) for the period July 1, 1954, to June 30, 1955. The state debt was \$29,454,000, bonded. For the fiscal year 1954-55 state receipts were \$278,796,033.02. The 25th state legislature appropriated \$230,902,174.98 for the biennium July 1, 1955, to June 30, 1957.

The Oklahoma bank commissioner reported 197 national banks in the

state with a total deposit of \$1,738,318,000 on June 30, 1955, and 18 state banks with a total deposit of \$376,565,709. The 29 state savings and loan associations in Oklahoma reported total resources of \$103,554,511 as of June 30, 1955.

Agriculture.—The 1955 wheat crop in Oklahoma was the smallest since 1916. Estimated production of corn in 1955 was only a little more than one-third average production during the ten-year period 1944-53. Rains in the eastern, central and northwestern sections late in August improved ranges and the water supply for livestock, and planting of fall crops progressed. Very heavy rains over the state the first part of October broke the drought that had continued for several seasons and improved the outlook for the next year's crops.

Manufacturing.—The Oklahoma Employment Security commission reported that the monthly average of nonfarm employment in the state for the first six months of 1955 amounted to 538,233, and in the same period manufacturing employment averaged 87,083. These figures including both government and small firm employment. Average covered employment in the state for the calendar year 1954 was 314,792. Wages paid to all covered workers during the same year came to \$1,173,113,554. Manufacturing employees covered by the Oklahoma Employment Security act averaged 78,129 and drew total wages of \$314,291,441 in 1954. (M. H. W.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Oklahoma in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Oklahoma was third among the states in output of natural gas and fourth in petroleum, and ranked sixth in the value of its mineral output, with 4.72% of the U.S. total.

Table III.—Mineral Production of Oklahoma

(In short tons except as noted)

Mineral	Quantity 1952	Value 1952	Quantity 1953	Value 1953
Clays	520,000	\$ 577,000	578,000	\$ 637,000
Coal	2,193,000	12,688,000	2,168,000	13,227,000
Lead	15,000	4,874,000	9,000	2,438,000
Natural gas (000 cu. ft.)	554,033,000	29,918,000	599,955,000	41,397,000
Natural gasoline (000 gal.)	405,720	29,459,000	433,650	28,066,000
Petroleum (bbl.)	190,435,000	487,510,000	202,570,000	546,940,000
Petroleum gases (000 gal.)	376,026	14,090,000	414,036	14,886,000
Sand and gravel	3,770,000	2,912,000	4,701,000	3,970,000
Stone	9,636,000	8,974,000	8,404,000	7,467,000
Zinc	55,000	18,232,000	33,000	7,685,000
Other minerals	12,117,000	...	11,447,000
Total	\$621,351,000	...	\$678,160,000

Olympic Games. Australia, host to the XVI Olympiad, will be held at Melbourne, Nov. 22-Dec. 8, 1956, added extra manpower to the task of accelerating its vast building program for the summer games. All the main construction projects, the over-all cost of which would run into millions, were well under way as 1955 neared a close. The Olympic village, to house 6,000 athletes, a modern triple-deck grandstand for the main stadium on the Melbourne Cricket Ground, and a new boxing stadium were among the many big jobs.

Communist China accepted an invitation to compete in Australia, while East and West Germany agreed for the first time to send one team to each of the summer and winter competitions. Cortina d'Ampezzo, It., had completed plans to play host to the winter games.

The International Olympic committee, meeting in Paris, France, in June 1955 selected Rome, It., as the site for the 1960 summer games while the winter Olympics were awarded to Squaw Valley, Calif. (T. V. H.)

Oman and Muscat (Masqat): see ARABIA.

Ontario. Canada's second largest province, Ontario, was an original member of the confederation in 1867. Area, 412,582 sq.mi. Pop.: (1951 census) 4,597,542, (official est., 1955) 5,183,000. Capital, Toronto (*q.v.*) (1951) 675,754. (official est., 1955) 682,415. Metropolitan Toronto, a complex of 13 adjoining municipalities for civic administration purposes, had an estimated pop. of 1,254,001. Other large cities (1951): London 95,343, Windsor 120,049, Ottawa (*q.v.*) 202,045, Hamilton 208,321.

History.—No major political or legislative changes occurred in the province in 1955. The Conservative government led by Premier Leslie Frost was re-elected in a general election on June 9. The previous session was devoted to strengthening and extending existing legislation directed toward the further expansion of primary and secondary industry. A prime development was the formal association of the Ontario Hydro-Electric Power commission with the dominion's Atomic Energy commission in a project to develop nuclear energy for domestic and industrial use. In transportation the government undertook the construction of new access roads to lumbering and mining areas; gave to municipalities fresh assistance in the construction and maintenance of feeder roads connecting farm and decentralized industry with trunk highways. Recovery from the 1954 business recession was more rapid in Ontario than elsewhere, and capital expansion under private and government auspices was expected to reach a new peak. Manufacturing, employing one-third of the province's labour force, equalled the other nine provinces combined in investment, employment, payrolls and production. Entering the last quarter of 1955, Ontario had a labour shortage and a shortage of steel and cement for construction under way and contemplated. Work began during the year under the Hydro-Electric commission on construction of Ontario's share in the St. Lawrence river seaway and power project.

Education.—An increase of 66,000 in public- and secondary-school enrolment over 1954, to a total just short of 1,000,000, required legislation enabling the Ontario Municipal Improvement corporation to lend money to municipalities to provide accommodation and meet maintenance costs where debentures could not be sold at a reasonable cost. Direct grants from the treasury also were increased. A new normal school was opened in Toronto at the beginning of the academic year for training primary-school teachers. It was immediately overcrowded. There was a continuing teacher shortage. In fiscal 1955-56 ordinary expenditure for education was set at \$91,000,000, with \$71,000,000 to be added as capital grants to local school boards.

Public Health and Welfare.—In 1955 total health department costs were \$57,700,000, of which \$21,800,000 was capital grants to public hospitals. Welfare services cost \$27,800,000, up from 1954 by \$1,800,000. The province added \$250,000 to a dominion grant of \$125,000 to vaccinate grades 1 and 2 in elementary schools against polio.

Transportation and Communication.—Total 1955 expenditure on provincial highways for the year was \$175,600,000, plus \$45,000,000 in capital grants to municipalities. The outlay in 1954 was \$133,300,000. There were 1,500,000 motor vehicles licensed, using 6,200 mi. of provincial highways and 78,000 mi. of municipal roads. No current statistics of telephone, radio and TV installations were available in 1955 because of rapid expansion. The current backlog for new telephone connections would not be worked off until 1956.

Banking and Finance.—On March 10, 1955, the government reported a surplus on ordinary account of \$704,000, after appropriating from revenue \$17,500,000 for advance sinking funds and an additional \$38,500,000 for the highway reserve fund, standing at \$388,200,000. For fiscal 1955-56 a surplus of \$865,000 was estimated (after special sinking fund appropriations) from revenues totalling \$368,532,000. Net capital payments were estimated at \$176,254,000. Net capital debt (1955) \$1,053,055,041; (1954) \$1,035,488,084. The Bank of Toronto and the Dominion bank merged during the year. Chartered bank branches approximated 1,500. Credit unions in Ontario in 1955 had 350,000 members, up from 197,284 in 1952. Latest deposit total (1952) \$12,243,063. Province of Ontario Savings office, formed 1922, in latest year of record, 1953, had 100,000 depositors in 21 branches, with deposits totalling \$62,689,000.

Agriculture.—The trend of farm cash income in Ontario moved up, against that of the nation in 1954, totalling at Jan. 1, 1955, \$741,000,000, a gain of \$49,000,000 over 1953. There were 390,617 rural customers for hydroelectric power. In 1955 the government set up the Ontario Development corporation, with a revolving fund of \$250,000 to finance local telephone systems in rural areas—all linked to service with the Bell Telephone Company of Canada.

Manufacturing.—During 1954 Ontario factories had the second-best output on record, down from the 1953 peak by 6%, at \$8,326,000,000. Investment in new plant and equipment declined about 19% from 1953 to an estimated \$403,000,000. Employment fell by 4.5% from the 1953 peak of 634,000. There were 91 new industries established in 1954; (1953) 136. Fifty-seven of the new industries were of U.S. origin, 6 were

British. Electrical and electronic products, miscellaneous metal products, tools and instruments, mechanical equipment, chemicals and allied products, automotive and aeronautical industries were favoured in the above order for new capital investment.

Mining.—Total mineral production for 1954 in Ontario topped \$500,000,000 for the first time in history. Final compilation of returns released by the department of mines showed a total of \$503,757,221 for the year. Of this total, \$395,185,129 was made up of production by metal mines. Nonmetallic minerals accounted for \$13,077,053. Natural gas and petroleum were produced to a value of \$13,148,609 and structural materials were worth \$82,346,430. Total production in 1953, the previous high record, was \$465,877,093. (C. A. Sn.)

Oregon. A state of the United States, located in the Pacific northwest. Oregon was admitted Feb. 14, 1859, as the 33rd state. Area: 96,981 sq.mi. including 666 sq.mi. of water. Pop. (1950 census) 1,521,341; (July 1, 1955, est.) 1,664,000. Capital: Salem (43,140 in 1950); chief city: Portland (373,628).

History.—Oregon is normally a Republican state, but Oregon voters in 1954 elected United States senator Richard L. Neuberger, the first Democrat elected to this office since 1914. In Nov. 1954 voters repealed the milk marketing price control act; approved a constitutional amendment raising from 8% to 10% the requirement of signatures on initiative petitions for constitutional amendments; approved measures to establish a new state mental hospital and to permit subdivision of counties for election of members of the legislative assembly.

Important measures passed by the 1955 legislative assembly included: equal pay for women; increase in unemployment compensation to \$35 per week; compulsory inspection of slaughtering plants; establishment of Portland State college as a unit in the state system of higher education. A substantial increase in the personal income tax was voted. A cigarette tax was approved by the legislature, but its collection was suspended because of a referendum on the measure.

Elective state officials (administrative) in 1955 were: governor, Paul L. Patterson; secretary of state, Earl T. Newbry; treasurer, Sig Unander; attorney general, Robert Y. Thornton; labour commissioner, Norman O. Nilsen; superintendent of public instruction, Rex Putnam.

SURVIVORS of a commercial air liner crash off the coast of Oregon, March 26, 1955, about to be picked up on a U.S. navy transport. Nineteen of 23 persons were saved from the three life rafts which were launched after the plane crashed following the loss of an engine shortly after leaving Portland

Education.—Enrolment in public schools for the school year 1953-54 was 312,564, including 75,819 high school students. The number of teachers employed was 13,475, and the average professional salary was \$4,134. Total operating expenses of public schools for the 1953-54 year were \$90,291,372. Average per capita cost was \$334.13. Total capital outlays for the year were \$33,883,883. Total value of school plant was \$272,928,225.

Total enrolment in the eight campus units of the state system of higher education for the year 1954-55 was 17,130. Enrolment in extension courses was 14,333. Total operating expenses of the state system for the year were \$20,772,310. Capital outlay for buildings for the biennium ending June 30, 1955, was \$3,840,000 from state building appropriations.

Social Insurance and Assistance, Public Welfare and Related Programs.—Expenditures for the year 1954-55 under the public welfare program, including administration, were \$32,769,311. The program embraces general assistance, old-age assistance and aid to the blind, to dependent children and to permanently and totally disabled persons.

Payments for unemployment compensation for the fiscal year 1954-55 were \$20,406,000. This amount was the third highest since the first benefits were paid in 1938. The highest number of weekly payments during the 1954-55 fiscal year was 30,567. The number of unemployed on June 30, 1955, was 27,700, according to the report of the state unemployment compensation commission. This was 11,200 fewer than on the corresponding date in the previous year.

The number of inmates in 11 state health, correctional and eleemosynary institutions on June 30, 1955, was 9,191. Expenditures for operating these institutions for the fiscal year 1954-55 was \$12,187,097. Expenditures of the state commission for the blind were \$280,968 for the year 1954-55.

Communications.—Steam railway mileage in Oregon as of Dec. 31, 1954, was 3,542 mi. of main line, operated by 23 common carriers. One electric railway company operated 37 mi. of main line.

Total mileage of the state highway system on June 30, 1955, was 7,405, of which 7,015 mi. was surfaced. Total mileage of county roads was 30,660, of which 19,560 mi. was surfaced. The total number of miles of roads in national and state forests, parks and reservations and in non-highway city streets was 21,235, of which 9,475 mi. was surfaced. Total expenditures of the state highway department for the fiscal year 1954-55 were \$65,216,890.

The total number of passenger automobiles registered in the state during 1954 was 688,911; trucks 84,729; buses 1,524.

Number of telephones in service as of Dec. 31, 1954, was 533,404.

Banking and Finance.—The state bonded debt as of July 1, 1955, was: gross \$177,657,100, net \$118,557,028. The gross debt of municipal subdivisions as of July 1, 1954, was \$223,241,336, the net debt \$209,532,026.

State treasury receipts from all sources in the fiscal year ending June 30, 1955, were \$389,996,177. Total assessed valuation of property as of Jan. 1, 1955, was \$2,019,583,180. Bank deposits on June 30, 1955, totalled \$1,856,570,777. On that date there were 12 national banks and 32 state banks in operation in the state. Branch banking is permitted.

The number of registered corporations in Oregon as of June 30, 1955, was 15,398, of which 7,913 were business corporations.

Agriculture.—Cash receipts from farming in Oregon for 1954 were: all commodities \$383,901,000, divided into crops, \$217,277,000, and livestock and livestock products, \$166,624,000. Government payments to farmers amounted to \$5,108,000. Livestock on farms as of Jan. 1, 1955: all cattle 1,458,000 head; sheep and lambs 746,000; hogs 138,000; horses 48,000; chickens 3,626,000; turkeys 278,000.

Manufacturing and Industry.—Oregon is the principal lumber manufacturing state in the nation. The cut of logs in 1954 was 8,860,753,000 bd.ft. Total lumber manufacture in 1954 was 7,750,000,000 bd.ft. Plywood manufacture: 2,080,614,000 sq.ft., $\frac{3}{8}$ -in. basis.

Table I.—Principal Crops of Oregon

Crop	Indicated 1955	1954	Average 1944-53
All wheat, bu.	21,751,000	25,023,000	26,559,000
Corn, bu.	1,750,000	1,400,000	1,111,000
Oats, bu.	11,180,000	12,515,000	9,147,000
Barley, bu.	18,104,000	19,836,000	9,909,000
Potatoes, bu.	13,570,000	13,200,000	11,724,000
Hay, tons	1,603,000	1,667,000	1,784,000
Apples, bu.	3,175,000	2,710,000	2,734,000
Bartlett pears, tons	67,500	37,500	53,700

Tourist travel is rated the state's third most important industry. Tourist expenditures in Oregon in 1955 were estimated at \$127,000,000. (C. A. Sp.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Oregon in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Oregon was third among the states in chromite and diatomite and fourth in mercury and pumice; and ranked 39th in the value of its mineral output, with 0.17% of the U.S. total.

Table III.—Mineral Production of Oregon

(Short tons, except as noted)

Mineral	Quantity 1952	Value 1952	Quantity 1953	Value 1953
Clays	277,000	\$ 570,000	292,000	\$ 296,000
Gold (oz.)	6,000	193,000	8,000	297,000
Pumice	60,000	202,000	73,000	174,000

Stone	6,251,000	8,893,000	4,939,000	6,302,000
Other minerals	8,260,000	...	8,750,000
Total		\$26,674,000		\$24,449,000

Organization for European Economic Cooperation. see FOREIGN AID, U.S.; INTERNATIONAL TRADE.

Organization of American States.

The Organization of American States in 1955 continued to function pursuant to the terms of the charter signed at Bogotá, Colom., in 1948. It is a continuation of the system of inter-American relations which had its inception in 1890 when the first Pan American conference met in Washington, D.C., and established the Pan American Union. Through the organization the 21 American republics seek to achieve an order of peace and justice, promote their solidarity, strengthen their collaboration and defend their sovereignty, territorial integrity and independence. The organization functions through six organs, namely, the Inter-American conference, the meetings of consultation of ministers of foreign affairs, the council of the organization, the Pan American Union, the specialized conferences and the specialized organizations.

The outstanding event of the year was the situation that developed between Costa Rica and Nicaragua. On Jan. 8, 1955, the government of Costa Rica, in a note addressed to the council of the organization, invoked the Inter-American Treaty of Reciprocal Assistance signed at Rio de Janeiro, Braz., in 1947, alleging that its territory, sovereignty and independence were threatened by acts that had their origin in Nicaragua. On Jan. 11, the council convoked the meeting of consultation of ministers of foreign affairs and constituted itself the provisional organ of consultation in accordance with the terms of the Rio treaty. A committee of investigation, composed of the representatives of Mexico, the United States, Brazil, Ecuador and Paraguay was appointed to proceed to Costa Rica and Nicaragua to determine the facts and to submit a report.

On Jan. 16, the council took a further step when it requested the member governments to expedite arrangements for the purchase by Costa Rica of aircraft which it may have ordered from them. This action was taken in the light of reports from the investigating committee that the government of Costa Rica did not possess planes or arms necessary to defend itself against the attacks of foreign planes of the type that were then in the hands of the revolutionary forces, and following a statement by the U.S. representative on the council that, if the council should request it, the government of the U.S. would accede to the request of Costa Rica for the purchase of planes. The same day the government of the United States announced that it had sold four P-51s to the government of Costa Rica. This action was decisive in enabling the Costa Rican government to meet the threat directed against it. The decisions adopted by the council of the organization were taken on behalf of the government of Costa Rica; they were not directed against another government. The government of Nicaragua repeatedly declared it was respecting its international obligations in what

contended was an internal disturbance in Costa Rica. It urged the investigating committee to come to Nicaragua and manifested its willingness to co-operate with the committee in the establishment of a frontier control system.

The investigating committee presented its report to the council of the organization on Feb. 18. On Feb. 24 the council adopted a series of resolutions intended to give practical effect to the recommendations of the committee and designed to bring about a complete solution between the two countries. It also appointed a special committee to co-operate with the governments of Costa Rica and Nicaragua in the preparation of a bilateral agreement and the establishment of a commission of investigation and conciliation to deal with problems that might arise between the two countries. On Sept. 8, 1955, the negotiation between the two governments had reached a stage at which it was possible for the council to cancel the meeting of consultation of ministers of foreign affairs and to terminate its status as provisional organ of consultation.

At that same meeting of Sept. 8, the representative of Ecuador called the attention of the council to a situation that was developing on the frontier of his country with Peru, and on the same date the government of Ecuador requested a meeting of consultation of ministers of foreign affairs under the Rio de Janeiro treaty of reciprocal assistance. Before taking action on this request, the council decided to communicate with the four guarantor states of Brazil, Argentina, Chile and the United States, established in 1942 to assist Ecuador and Peru to implement the agreement fixing the boundary line between the two countries. As a result of the action of these four states, the representative of Ecuador on Sept. 26 informed the council that a meeting of the organ of consultation was no longer necessary.

The Inter-American Economic and Social council continued during 1955 to carry out a broad program of inter-American economic and social co-operation. From Nov. 22 to Dec. 2, 1954, a conference of ministers of finance or economy in the 14th extraordinary meeting of the Inter-American Economic and Social council was held in Rio de Janeiro. All the member states of the organization were represented and a series of resolutions were adopted dealing with matters of transportation; agricultural prices, markets and surpluses; economic co-operation; commercial policy; and the financing of economic development.

The Inter-American Economic and Social council also continued to sponsor a program of technical assistance with the co-operation of inter-American specialized organizations and the Pan American Union. The 1955 program consisted of a training centre in economic and financial statistics in Santiago, Chile, sponsored by the Pan American Union and the Inter-American Statistical institute; an inter-American housing centre located in Bogotá, and a centre for training rural normal school teachers in Venezuela, both sponsored by the Pan American Union; a centre in Brazil for the evaluation of natural resources organized by the Pan American Institute of Geography and History; workshops on the administration of children's services conducted by the American International Institute for the Protection of Childhood; and a comprehensive program of education in agricultural and rural life organized by the Inter-American Institute of Agricultural Sciences.

The Pan American Union, with headquarters in Washington, D.C., continued to function as the general secretariat and permanent central organ of the organization. Through its several technical and administrative divisions it served the other organs of the organization and during 1955 undertook studies and issued reports on economic, social, cultural and legal matters.

Three inter-American specialized conferences were held in 1955: the 10th Pan American Child congress at Panamá, Feb.

6-15; the 3rd Inter-American Statistical conference at Rio de Janeiro, June 9-22; and the 6th general assembly of the Pan American Institute of Geography and History at Mexico City, Mex., July 25-August 6. (See also ORGANIZATION OF CENTRAL AMERICAN STATES.) (W. MR.)

Organization of Central American States.

Known in Spanish as O.D.E.C.A. from the initials of its name, Organización de Estados Centroamericanos, this regional organization of Guatemala, Honduras, El Salvador, Nicaragua and Costa Rica represents one more attempt to restore the unity of the Central American countries. When these countries broke away from Spain in 1823, a confederated republic entitled Provincias Unidas de Centro América was proclaimed, but it ceased to be effective long before it was officially terminated in 1839. Since then there have been numerous attempts to revive the union, but they all failed to meet the hard test of reality.

O.D.E.C.A. was created by the charter of El Salvador in Oct. 1951, but political tensions, including the civil war in Guatemala, prevented it from progressing beyond the paper stage. After much delay, the first formal conference met from Aug. 18 to 24, 1955, in the 17th-century University of San Carlos Borromeo in the Guatemalan city of Antigua, which was once the capital of the colonial captaincy general of what is now called Central America. The meeting was opened by Pres. Carlos Castillo Armas of Guatemala, and the five republics were represented by their foreign ministers. Panamá had declined to join the group but was represented by observers. Since it was not clear whether the new organization was a regional organization within the UN or a regional organization within a regional organization (the Organization of American States), both the UN and O.A.S. were represented by observers only.

Internal rivalries within Central America had in the past presented an insuperable obstacle to Central American unity, and they almost wrecked the Antigua meeting. A "gentlemen's agreement" had been reached at a preliminary meeting in Tegucigalpa, the capital of Honduras, according to which a Costa Rican would be elected as secretary-general of the organization. However, Nicaragua blocked the candidacies of three Costa Rican candidates, and the Costa Rican foreign minister Mario Esquivel declined to be nominated. The meeting was saved when José Guillermo Trabanino, foreign minister of El Salvador, was elected by acclamation, this being interpreted as a victory for Nicaragua over Costa Rica. The election of Trabanino was only a temporary solution, since a final selection was to be made at a meeting to be held within six months.

The immediate proposals of O.D.E.C.A. were to co-ordinate higher education in order to avoid undesirable duplication on the university level; to organize a Council of Culture and Education as a specialized organization within the organization; to bring about a customs union, although it should be pointed out that the coffee-producing Central American countries have in general competitive economies, making trade between them somewhat illusory; and finally, to codify Central American law, with a view to unifying the legal systems. The Antigua assembly approved a budget of \$125,000 annually, of which \$85,000 would cover salaries. The salary of the secretary-general was to be \$12,000 a year, with \$6,000 for expenses. (R. HN.)

Osteopathy. Osteopathy is the practice of medicine and operative surgery in all their branches by osteopathic physicians. As an emergent from American medical practice of the latter 19th century, its doctors employ all medical, surgical, immunological, pharmacological, psychological and hygienic procedures that are of proven value. Disturbances of

the musculoskeletal system are considered fundamentally important in an approach to the problems of health and disease. Their treatment by osteopathic manipulative therapy is a distinctive characteristic of osteopathic care of the patient. To become an osteopathic physician, the student must have successfully completed four years of high school, three years of professional training in an accredited college and four years of professional education in an approved osteopathic college. A 12th educational year consists of an internship in an osteopathic approved teaching hospital.

There were in 1955 six approved colleges of osteopathy and surgery in the U.S. More than 12,000 osteopathic physicians were in practice, the majority of whom were members of the American Osteopathic association with headquarters at 212 East Ohio street, Chicago 11, Ill. Its president for 1955-56 was Hobert C. Moore, Bay City, Mich. The 60th annual convention was to be held in New York city in July 1956. (R. P. K.)

O. T. C. (Organization for Trade Cooperation): *see* **TARIFFS.**

Ottawa. The capital of Canada, located at the confluence of the Gatineau, Rideau and Ottawa rivers, in the province of Ontario, Ottawa covers 30,481.6 ac., more than one-tenth of which is waterways; pop. (1951) 202,045; (1955 est.) 211,419.

Mayor Charlotte Whitton continued in office during 1955, taking the oath of office on Jan. 4 in the first council meeting of the second century of the municipality. Her inaugural speech was entitled "Our Second Century." She emphasized that the population of the town of Bytown in 1854, when a petition was made to change it to the city of Ottawa, was about 7,760 but today was more than 200,000, with the latest assessment for taxes (1954) reaching \$329,270,858 taxable, \$180,945,735 being exempt property, the latter reported to be the highest of any city in Canada and one of the highest in North America. Dominion of Canada exempt property alone was assessed at \$109,000,000. "Our financial health is sound, our credit good," Mayor Whitton said. "The gross operating requirements of the city itself, the civic hospital, libraries and schools called for \$24,449,252 this year, of which provincial grants provided 13.2%, the Dominion grant 6%-7%, patients' fees in the civic hospital 5%-6%, all other miscellaneous revenue 13%-14%, the city surplus 7.3% and the tax levy of \$12,903,718 provided 52.8%, or better than \$1 out of every \$2 spent."

On June 23 during a discussion in the senate on legislation for increasing federal grants paid to municipalities in lieu of taxes on crown-owned property, Senators Norman Lambert, Ottawa, and Thomas Reid, New Westminster, suggested that Ottawa and neighbouring municipalities should be made into a federal district like Washington, D.C. This resulted in sharp debate and opposition from others. However, Prime Minister Stephen St. Laurent settled the issue for the time being by stating in the house of commons that there were no plans to make the Ottawa area into a federal district. Long an opponent of liquor license extensions, Mayor Whitton charged the Ontario Liquor Control board in June with throttling the city's protest against the licensing of further liquor outlets in Ottawa.

The Ottawa Transportation commission's operations in 1955 appeared likely to end in a deficit. With more than 49,000 motor vehicles owned in Ottawa in 1955, traffic problems were considered serious so, on the city's initiative, the Smith Traffic Study was undertaken, with merchants, the Ottawa Transportation commission and federal authorities co-operating. The report of this study suggested substantial action both in transport and parking. The 19-mile throughway, the Queensway,

was started in 1955 and scheduled for completion in 1959-60. This would combine the federal district commission's cross-town parkway with the trans-Canada route through Ottawa and Ottawa's own crosstown thoroughfare, with the cost of the whole project estimated at \$14,500,000 to \$15,000,000.

(M. L. S.)

Outer Mongolia: *see* **MONGOLIAN PEOPLE'S REPUBLIC.**

Pacific Islands, British. Under this heading are grouped the territories administered by the high commissioner for the western Pacific.

Area	Area (sq.mi.)	Population
British Solomon Islands protectorate*	11,500	100,297†
Gilbert and Ellice Islands colony†	369	35,824‡
Central and Southern Line islands	11,869	137,000‡
Totals		

*With the Santa Cruz, Lord Howe (Ontong Java), Reef and Duff groups and Cherry and Mitre islands. †With Phoenix and Northern Line islands and Ocean Island; Phoenix islands include Canton, an Anglo-U.S. condominium with international airport. ‡1954 est. §1947 census.

New Hebrides (*q.v.*), an Anglo-French condominium, is also administered by the western Pacific high commissioner.

Populations: Melanesians predominate in Solomons, Micronesians in Gilbert and Ellice Islands. Headquarters: Honiara, Guadalcanal, Solomon Islands (pop. about 2,000). High commissioners in 1955, Sir Robert Stanley and (from September) John Gutch; resident commissioner, Gilbert and Ellice Islands, M. L. Bernacchi.

History.—The high commissioner for the western Pacific, Sir Robert Stanley, retired in July 1955. Experts from the United Kingdom made recommendations, which were approved, for improvements in harbour facilities at Honiara. The Solomons government placed an order for a 108-ft. vessel to run a scheduled cargo and passenger service among the islands. The high commissioner laid the foundation stone of a new teacher-training and vocational centre at Honiara.

On Guadalcanal a promising strike of gold was found by the government geological department. Work began on a new central hospital at Tarawa, Gilberts. (J. J. Ty.)

Education.—*Solomon Islands* (schools, 1954): government primary 6, native council primary 3, higher primary 1 (92 pupils); Chinese 1, European 1; several mission schools. *Gilbert and Ellice Islands* (schools 1953): primary 255, pupils 8,084, secondary 1, pupils (1954) 60. *Fiji* (schools, 1954): primary 456, pupils 58,835, teachers 1,387; secondary 29, pupils 1,932, teachers 105; 1 teachers' training school, students 175; Central Medical school, students (1952) 192; Educational Research institute (established 1952). *Tonga* (schools, 1953): primary 133, pupils 11,311, teachers (1952) 384; secondary 10, pupils 2,314. Tonga high school (primary and secondary), pupils (1954) 102. Teachers' training college 1, students 55, teachers 9. *Pitcairn Island* (1953): 1 primary school, 1 teacher.

Finance and Trade.—Monetary unit: Australian pound (£A1.25=£1.00 sterling=U.S. \$2.80), used in *Solomon Islands* and *Gilbert and Ellice Islands*; *Fiji* and *Pitcairn Island*, Fijian pound (£F1.11=£1.00 sterling); New Zealand and U.K. currencies also circulate in Pitcairn; *Tonga*, Tongan pound (£T1=16s. sterling=U.S. \$2.24).

Territory	Revenue	Budgets		Foreign trade (1954)	
		Expenditure		Imports	Exports
Solomon Islands (1953 actual)	£576,840	£612,433	£1,203,368	£1,919,941	
Gilbert and Ellice Islands (1953 revised est.)	£378,481*	£357,347*	£311,532†
Fiji (1954 actual)	£F5,030,943	£F4,615,678	£10,480,000	£9,960,000	
Tonga (1952-53 actual)	£490,475	£442,975	£782,000	£1,080,000	
Pitcairn (1953 est.)	£F10,699	£F7,284	—	—	—

*Excluding grants-in-aid and Colonial Development and Welfare expenditure. †1952. ‡Value not available.

Main exports: *Solomon Islands*, copra, trochus shell; *Fiji*, sugar, copra; *Tonga*, copra, bananas.

Pacific Islands, French. Under this heading are grouped two overseas territories of the French union, and the Anglo-French condominium of the New Hebrides (*q.v.*). Areas and populations are:

Territory	Area (sq.mi.)	Population (1953 est.)
New Caledonia and dependencies	7,654	63,000
French Settlements in Oceania	1,545	63,000

Population. *New Caledonia* proper (6,533 sq.mi.) and the dependencies: Melanesian with Polynesian admixtures; Europeans 21,029, mainly French; 6,885 Javanese; 4,075 Tonkinese. Seat of commissioner-general: Nouméa, pop. (1951 est.) 20,000. Commissioner-general for the Pacific ocean in 1955, René Hoffherr.

The French Settlements in Oceania consist of the Society Islands (the largest of which is Tahiti), the Marquesas, Tuamotu and other smaller islands. Pop.: Polynesian, majority Christian; Europeans (1951) 2,271 (1,424 French); Chinese 6,593. Seat of governor: Papeete, on Tahiti, pop. (1946 est.) 12,428 (European population only). Governor in 1955, Jean Toby.

History.—The governor of New Caledonia visited the Loyalty and Wallis Islands during 1955. On May 9 a cemetery containing the graves of 300 New Zealand soldiers was opened at Bourail. The French government approved a 10,000,000-franc project for a dam on the Yaté river and for modernizing the Doniambo nickel works.

The French Settlements in Oceania passed through an economic crisis resulting from the fall in copra prices; a grant of aid from France was expected. Walter Grand, elected president of the territorial assembly, made peace between the local political parties. (See also FRENCH UNION.) (Hu. De.)

Foreign Trade.—(1954) Monetary unit: franc C.F.P. (Colonies Françaises du Pacifique) which equals 5.50 metropolitan francs. U.S. \$1=350 metropolitan francs. *New Caledonia*: imports 1,435,000,000 fr. C.F.P., including 537,000,000 fr. C.F.P. from France and 456,000,000 fr. C.F.P. from Australia; exports 1,576,000,000 fr. C.F.P., including 1,294,000,000 fr. C.F.P. to France. *Oceania*: imports 709,000,000 fr. C.F.P., including 232,000,000 fr. C.F.P. from France, 207,000,000 fr. C.F.P. from the United States; exports 664,000,000 fr. C.F.P., including 389,000,000 fr. C.F.P. to France. Production (metric tons, 1953): *New Caledonia*, chrome ore (metal content) 60,000, nickel (metal content) 25,000, manganese (metal content) 2,600; *Oceania* (exports), phosphate rock 245,000, copra (1954) 22,500.

Pacific Islands under Trusteeship: see MARSHALL, CAROLINE AND MARIANA ISLANDS; TRUST TERRITORIES.

Paints and Varnishes. The value of paint production in the United States in 1955 was estimated at \$1,500,000,000 as compared with the corrected 1954 total of \$1,361,135,000. Sales of paint for the home advanced 6% while paint for industrial use advanced 17% over 1954.

With the unabated increase in general industrial activity, temporary shortages arose in titanium pigments, phthalic anhydride, chlorinated rubber and vinyl resins. The worst freezing weather in the history of the Gulf states destroyed at least 90% of the 1955 tung oil crop. Broadening uses of selenium in atomic energy and other fields created shortages of selenium for its small but important use in cadmium red pigments. To meet this shortage, there was offered "mercadmium red" pigment which combines the sulphides of cadmium and mercury, with claims of better qualities at a lower price.

Alkyds continued to increase as the large-volume quality vehicle for paints. Their versatility was increased through a wider choice of constituent acids and alcohols. New commercial or semicommercial production of isophthalic, isosebacic, itaconic and azelaic acids formed useful supplements to the long-established use of polyfunctional phthalic, fumaric, maleic, adipic and sebacic acids or anhydrides.

A zirconium soap was offered commercially as a supplement to the long-established paint drier metals. In combination with other drier metals it produced faster drying with less yellowing of white and pale tints of enamels.

Competition continued to rise between water-thinned and solvent type paints for exterior use. Painting difficulties arising from the alkalinity of concrete blocks, stucco and other masonry

surfaces, especially in Florida and California, were met with some success by vinyl type water-thinned paints based on polyacrylate esters in some formulations and a polyvinyl acetate in others. These two paint vehicles competed with drying oils and either alkyd, chlorinated rubber or hydrocarbon resins in exterior paints and with these vehicles plus the important butadiene-styrene latex vehicles in interior paints. One authority estimated that these two vinyl types constituted 15% of the total 178,000,000 gal. of exterior and interior trade sales paints sold in 1955. Acrylic modified oils and alkyds were offered as durable alternates to the very fast drying styrene copolymer oils and alkyds which had become established in industrial enamels in the years following World War II.

Several makers offered styrene-polyester paints, to be dried or cured by peroxides at the time of use for such diverse uses as pleasure boat repair, industrial maintenance painting and magnet wire enamelling.

A review of nuclear energy applications in paint listed studies of sedimentation rate, stripping rate of paint removers and wear resistance, among others. It recognized the utilization of nuclear energy in both the building up and degradation of polymers useful in paints. (Jo. C. W.)

Pakistan. A member of the Commonwealth of Nations in the Indian subcontinent. Pakistan consists of a federation of two provinces. East Pakistan, with 55% of the population, is in the northeastern part of the subcontinent, 850 mi. by air from West Pakistan in the northwest. Karachi (pop., 1951, 1,126,417) the federal capital, is geographically in West Pakistan.

Province	Capital (pop. 1951 census)	Area (sq.mi.)	Population (1951 census)
West Pakistan	Lahore (849,476)	310,236*	33,779,165*
East Pakistan	Dacca (276,033)	54,501	42,063,000
Total		364,737	75,842,165

*Including small areas in Karachi not part of West Pakistan province but reserved to the federal government. Excluding Kashmir, under dispute between India and Pakistan.

Language: Urdu (official, and widely understood), Punjabi, Sindhi, Pushtu, Baluchi and Gujarati in West Pakistan; Bengali (official) in East Pakistan; English used for many official purposes and higher education. Religion: Moslem 85.7%; Hindu 12.8%; Christian 0.7%, i.e., about 539,000; Sikh, Parsee and other minorities. Chief towns other than federal and provincial capitals (pop., 1951, including cantonments): Hyderabad 241,801; Rawalpindi 237,219; Multan 190,122; Lyallpur 179,144; Sialkot 167,543; Peshawar 151,776; Chittagong 145,777; Gujranwala 120,860; Barisal 89,694; Quetta 84,343. Governors general in 1955: Ghulam Mohammad and (from Oct. 6 [acting from Aug. 5]) Maj. Gen. Iskander Mirza. Prime ministers in 1955: Mohammad Ali and (from Aug. 11) Chaudry Mohammed Ali.

History.—The cabinet appointed in Oct. 1954 was strengthened by the addition of two non-Moslem league political leaders. Khan Sahib from the North-West Frontier Province and H. S. Suhrawardy from East Bengal. The country welcomed the governor general's proclamation dissolving the constituent assembly, but its legality was challenged in the Sind chief court. In May the federal court ruled that the old assembly was legally dissolved, that a new one should be elected to frame a constitution and exercise legislative powers, and that the question of validating some important laws irregularly enacted by the old assembly should be decided by the new one, pending which they were properly enforceable by the governor general. In the new assembly, elected by the provincial legislatures with parity of representation between East and West Pakistan, the Moslem league, though the largest party, had no absolute majority. In August the prime minister, Mohammad Ali, resigned, and

Chaudry Mohammed Ali, previously finance minister, succeeded him and formed a coalition government, which included Fazlul Huq of the East Pakistan united front. Meanwhile in East Pakistan parliamentary government was restored in June and a united front ministry took office there. In September Ghulam Mohammad for reasons of ill-health resigned the office of governor general and was succeeded by Iskander Mirza. Since Nov. 1954 detailed preparations had been made for integrating the provinces, states and frontier regions of West Pakistan into a single province parallel with East Pakistan. This plan, besides simplifying administration and economic development, offered the advantages of eliminating old provincial rivalries and of facilitating further work on the constitution. The plan was published in March. On Sept. 30 the new constituent assembly passed the necessary bill and on Oct. 14 the province of West Pakistan came into being with its capital at Lahore and Khan Sahib as its chief minister; provision was made for an interim provincial legislature representing all its parts, including the tribal areas (frontier regions) with 22 members elected by their councils of elders.

External Relations.—In January Ghulam Mohammad at the invitation of the Indian president paid a good-will visit to New Delhi. In May Mohammad Ali and Iskander Mirza had friendly talks in India with Jawaharlal Nehru and other ministers on outstanding problems; no conclusion was reached on the Kashmir issue; some agreements resulted on other matters, such as prevention of border incidents and improvement of travel and transit facilities. Discussions between Indian and Pakistani technicians and experts of the International Bank for Reconstruction and Development regarding the use of the Punjab rivers for irrigation were resumed in Washington, D.C., and the date for bringing them to a conclusion was changed to March 1956; meanwhile the amounts of additional withdrawals of water for Indian canals in the summer of 1955 were settled by agreement.

State visits to Pakistan were made by the president of Turkey, the king of Jordan and the Egyptian president. Other visitors included the prime ministers of the Sudan and of Saudi Arabia. Mohammad Ali attended the Bangkok conference of the southeast Asia defense treaty powers in February, and the Bandung Asian-African conference in April. In September Pakistan acceded to the Baghdad pact between Iraq, Turkey and the United Kingdom for mutual co-operation in the middle east. Relations with Afghanistan were troubled. For some time the Afghan government had endeavoured to promote the idea of a separate Pathan state of "Pakhtoonistan" among the northwest frontier tribes, who however paid little heed in view of the economic and social benefits that they enjoyed in Pakistan. At the end of March, after publication of the plan for integrating the various units of West Pakistan and a speech by the Afghan prime minister criticizing it, a riotous mob attacked the Pakistan embassy at Kabul and insulted its flag. The Pakistan government demanded full satisfaction, but a dispute arose over its terms. Efforts by other middle eastern powers to mediate were unsuccessful, and official relations were severed till September, when honourable amends were made and the two governments agreed to eschew dangerous propaganda. But in October the Afghan government, having proposed a discussion of mutual relations, made it a condition that meanwhile the act integrating West Pakistan should not be implemented. The Pakistan government, while declaring its readiness to discuss matters of common concern, rejected the suggested condition as an unwarranted intrusion into Pakistan's internal affairs. The Afghan government thereupon recalled its diplomatic representative, and relations were again suspended.

Economic Position.—As no legislature was sitting, the budget

statement was broadcast on March 31 and issued as a white paper. The revised estimates for 1954-55 showed a deficit of Rs. 25,000,000, mainly because of flood relief. For 1955-56 expenditure on revenue account was estimated at Rs. 1,203,000,000, and revenue on the existing basis at Rs. 1,190,000,000, which it was proposed to supplement by new taxation estimated to have an over-all surplus of Rs. 500,000. A capital expenditure of Rs. 1,148,000,000 was contemplated for development in 1955-56, to be found from internal and external loans, foreign aid and a moderate degree of deficit financing. The United States government, in addition to previous assistance, offered aid of \$110,000,000 for the fiscal year 1954-55, including surplus agricultural commodities. In March Ghulam Mohammad inaugurated a new Indus barrage, called by his name, in Lower Sind, part of a project designed to irrigate 2,750,000 ac. The first project for utilizing the natural gas discovered at Sui in Baluchistan matured in October with the completion of a pipeline making it available at Karachi. The report of the state bank for the year ended June 30, 1955, showed that the balance of payments moved into a surplus.

In July the government decided to devalue the Pakistan rupee to 1s. 6d. sterling (the same as the Indian rate) in order to meet the changing needs of the country's economy. In 1949, when it was decided not to devalue, Pakistan exported only primary products and depended on imported manufactures and capital goods for industrial development; since then industrial production had increased so greatly as to make the country nearly self-sufficient in a considerable range of goods and capable of exporting some of them, while world prices of jute and cotton after a period of boom had fallen. The objects of devaluation were to facilitate exports and to increase the purchasing power of the agricultural population.

In the autumn Pakistan was afflicted by disastrous floods. East Pakistan again suffered severely, but the greatest destruction occurred in West Pakistan, where large areas of Sind were inundated in September, and in October abnormal floods in the Punjab caused grave damage to the canal system and to the cotton, rice and sugar crops. (See also INDIA.) (J. WN.)

BIBLIOGRAPHY.—(London, 1955, unless stated).—H. Bolitho, *Jinnah, Creator of Pakistan* (London, 1954; New York, 1955); *Crescent and Green; Handbook for Travellers in India, Pakistan, Burma and Ceylon*, 17th ed.; Board of Trade Overseas Economic Survey, *Pakistan May 1954* by F. B. Arnold (H.M.S.O.).

Education.—Schools (1955): primary 42,474, pupils 3,200,000, teachers (1951) 88,697; secondary 5,118, pupils 1,150,000, teachers (1952) 43,823; vocational 242. Teachers' training colleges 134, students (1952) 6,930. Universities 6, students 57,509; other institutions of higher education 169. Adult education centres 881.

Finance and Banking.—Monetary unit: Pakistan rupee, with a new selling rate on July 31, 1955, of Rs. 4.76 to the U.S. dollar. Budget (1954-55 revised est.) revenue Rs. 1,154,400,000, expenditure Rs. 1,179,500,000; (1955-56 est.) revenue Rs. 1,190,200,000, expenditure Rs. 1,203,900,000. Currency circulation (Dec. 1954): Rs. 2,575,000,000, (April 1955) Rs. 2,622,000,000. Bank deposits (Dec. 1954): Rs. 1,269,000,000, (April 1955) Rs. 1,283,000,000. Gold and foreign exchange (April 1955): U.S. \$327,000,000.

Foreign Trade.—(1954) Imports Rs. 1,074,000,000; exports Rs. 1,187,000,000. Main sources of imports (1954): U.K. 29%; continental European Payments Union countries 20%; Japan 11%; U.S. and Canada 8.9%; India 5%. Main destinations of exports: U.K. 19%; continental E.P.U. 28%; Japan 9%; India 9%; U.S. and Canada 7%. Main exports: cotton 29%, jute 46%.

Transport and Communications.—Roads (1953): 114,600 km. Motor vehicles in use (1952): cars 34,021, commercial vehicles 17,137. Railways (1954): 11,397 km.; passenger-km. (April 1952-53) 8,983,000,000; freight, ton-km. (1953) 5,640,010,000. Shipping (July 1954): merchant vessels of 100 gross tons and over, 56; total tonnage 169,782. Air transport (1954): passenger-km. 58,572,000; freight, ton-km. 1,734,000. Telephones (Jan. 1954): 27,886. Licensed radio receivers (1953) 98,000.

Agriculture.—Main crops (metric tons, 1954): rice 13,400,000; tobacco 92,500; wheat 3,742,000; barley 159,000; maize 448,000; sugar, raw value 91,000 (excluding 115,000 palm sugar); chick-peas 655,000; jute 491,000; cotton, lint 266,000; cottonseed 502,000; tea 24,500; (1953). linseed 12,000; rapeseed and mustard seed 276,000; sesame 37,000. Live-stock (Sept. 1952): cattle 24,069,000; sheep 6,570,000; horses 494,000; mules 41,000; asses 959,000; buffaloes 4,980,000. Wool production (1954) 7,000 metric tons. Meat production (1951) 287,000 metric tons.

Industry.—Applicants for work (1954) 88,500, (March 1955) 100,400. Index of production (1950=100) 285 in 1954. Fuel and power (metric tons, 1954): coal and lignite 563,400; electricity 488,400,000 kw.hr.; natural gas (1953) 43,600,000 cu.m. Raw materials (metric tons, 1954): chrome ore 19,200; crude oil 259,900. Manufactured goods (1954): cement 685,800 metric tons; cotton cloth 318,080,000 m.

Palaeontology. **Vertebrate.**—The international co-operation which characterizes research on vertebrate fossils was illustrated during 1955 by the reports of scientists from many nations at the colloquium on "Problèmes actuels de paléontologie" held in Paris, Fr. Advances in palaeoneurology, made especially through comparisons of the endocranial casts of extinct and living animals, were summarized by T. Edinger (Harvard). J. Millot (Paris) demonstrated the anatomy of the anachronistic living coelacanth fish *Latimeria*; J.-P. Lehman (Paris) examined with disfavour the supposed origin of urodeles from lungfish ancestors. D. M. S. Watson (London) outlined the descent of diapsid reptiles from millerettids, while J. A. Orlov (Moscow) described important finds of mammallike deirocephalian reptiles. The dating of Tertiary mammalian faunas in Spain was revised by M. Crusafont Pairó (Sabadell). Problems of human origins drew the attention of A. C. Blanc (Rome) and J. Hürzeler (Basel); the latter interpreted *Oreopithecus* as a possible human ancestor. A. S. Romer (Harvard), who discussed the interdependence of palaeontology and comparative anatomy, stressed in conclusion the interdependence of the world family of palaeontologists.

Among the year's significant books of general interest was *The Origin of Vertebrates* by N. J. Berrill, a stimulating discussion of chordate biology and relationships. The colourful history of backboned animals was summarized for students and laymen by E. H. Colbert in *Evolution of the Vertebrates*. The contribution of vertebrate fossils to a reconstruction of past environments was exemplified by A. Papp and E. Thenius in an integrated palaeobiological study of the Vienna basin in early Tertiary time.

Anatomical studies on the most primitive fishes, the ostracoderms, by D. M. S. Watson revealed that the fossil cephalaspids and anaspids (like the living lampreys) were probably derived from ancestors of the ammocoete type; the allied heterostracans apparently branched off before the ammocoete stage. Cephalaspid pectoral fins proved to be an independent development, not homologous with those of higher vertebrates; and the structures formerly interpreted as "electric fields" were pressure-sensory organs instead.

In Stockholm, a centre for intensive studies on archaic fishes, Stensio's comprehensive restudy of the placoderms demonstrated that arthrodires and acanthodians matched other fishes in the evolutionary stage of their visceral skeletons. Comparative histologic studies by T. Orvig on the exoskeleton of ancient vertebrates cast light on the growth, fusion and disintegration of bony armour plates.

Contemporary knowledge of fossil amphibians, reptiles and birds was epitomized in volume 5 of the *Traité de paléontologie* edited by J. Piveteau. Particularly noteworthy contributions on amphibians were chapters by E. Jarvik (Stockholm) on the oldest known land vertebrates, the ichthyostegals from uppermost Devonian beds of Greenland; and Piveteau's treatment of fossil frogs. Among the chapters on reptiles were reviews of the lacodonts and amphibious Triassic "squamates" by B. Peyer and E. Kuhn-Schwyder (Zürich); and of the rhynchocephalians, lizards and snakes by R. Hoffstetter (Paris). Mammallike reptiles (excluded from this volume of the *Traité*) were the subject of numerous recent studies, including a monograph on Middle Permian tetrapods of the western Urals by I. A. Efremov (Moscow) and a cogent paper in which F. R. Parrington (Cambridge), after reconstructing the jaw musculature in certain

gorgonopsids, deduced that an eardrum and external auditory meatus were present in synapsids generally as derivatives of the captorhinomorph ear.

Another study of jaw musculature led G. Haas (Jerusalem) to conclude that the great skull "frill" in ceratopsian dinosaurs developed less as protective armour than as a frame for attachment of the adductor externus muscles. Two types of fossil eggs from Shantung were interpreted by C. C. Young and M. M. Chow (Peking) as pertaining to hadrosaurian and other dinosaurs. Birds, the rarest of fossils, were the subject of descriptive papers and a popular summary by H. Howard (Los Angeles).

Problems involved in applying statistical methods of faunal analysis—methods appropriate in population studies on living mammals—to the contents of fossil quarries were examined by J. A. Shotwell (Eugene, Ore.) as an approach to the palaeoecology of mammals. C. L. Gazin (Washington) monographically reviewed the Upper Eocene artiodactyls of North America and offered a pioneer interpretation of their relationships. The osteology and stratigraphic distribution of fossil elephants from the Malay archipelago and the Punjab were treated by D. A. Hooijer (Leyden). A mutation affecting the molar teeth of brown bears and cave bears was traced through its 1,000,000-year history by B. Kurten (Helsinki).

A divergent, short-lived family of ancient American primates, the phenacolemurids, was defined by G. G. Simpson (New York) and its evolutionary implications analyzed. The comparative anatomy and classification of fossil as well as living tarsoids were considered in a definitive volume by W. C. Osman Hill (London).

Although the preceding paragraphs cannot constitute a thorough or even representative summary of the year's progress, they may serve to suggest the international nature of research and the scope and great variety of problems examined by palaeontologists and by others using palaeontological data. (D. BD.)

Palaeobotany.—Palaeobotanical discoveries of considerable general interest were made during the latter part of 1954 and the first half of 1955 from some of the oldest as well as the most recent rock formations. Petrified remains of several different algae and fungi were found (A. A. Tyler and E. S. Barghoorn, 1954) in a Pre-Cambrian chert from southern Ontario. These represent the oldest known structurally preserved organic remains yet reported, their age being estimated at 1,300,000,000 years although it may be as great as 2,000,000,000 years. It is evident from this and previously reported fossils that the algae and fungi are of extreme antiquity, having existed in the waters of the earth for 1,000,000,000 or 1,500,000,000 years before plants began their tenuous invasion of the land. Two Canadian palaeobotanists (N. W. Radforth and D. C. McGregor, 1954) described an abundant assemblage of fossil spores from Devonian rocks of Alberta and the Gaspé. Existing knowledge of the earliest land plants comes from this period and the preceding Silurian Age. The spores described by these workers indicate a much greater diversity of land plant life than was formerly known for this early horizon. Although it is not possible at present to correlate the spores, many of which are beautifully preserved, with the plants that bore them, they suggest several groups of ferns as well as certain conifers and a moss in addition to aquatic plants and the more primitive early invaders of the land.

In contrast with these records of very ancient plant life it is interesting to note an equally significant one from the modern end of the geologic time scale. Botanists have devoted a great deal of effort in recent years to gain a better understanding of the origin of certain crop plants, particularly corn (*Zea mays*). It is, therefore, of special interest to note the discovery of pollens identified as those of corn from a deep drill core

DINOSAUR BONES being chiselled out of the rock in which they were buried about 100,000,000 years ago at Dinosaur National monument near Jensen, Utah, in 1955. About four years would be required before the bones were completely uncovered

taken in Mexico City. The pollens were found at a horizon more than 200 ft. below the surface of the ground and may be as much as 50,000 years old. This discovery indicates that corn existed at an appreciably earlier date than was formerly suspected and apparently before the appearance of man on the North American continent.

A good summary of our knowledge of the past history of the liverworts was given by B. Lundblad (1954), who also added several new discoveries. The liverworts are inconspicuous yet common and widely distributed plants related to the mosses. Several modern forms (such as *Marchantia* and *Riccia*) are known from the Mesozoic, and a few records have been reported from the Upper Carboniferous. It is evident that the modern groups of liverworts were differentiated as far back as the Carboniferous, and, although they remain a significant element of the modern vegetation, little evolution has occurred in the group for nearly 200,000,000 years.

Several publications appeared dealing with Carboniferous plants which not only add to understanding of the flora of that period but also assist in understanding of the origin of modern groups whose ancestors can be traced back to that distant time. M. L. Abbott (1954) presented a critical study of American Carboniferous ferns belonging to the genus *Oligocarpia*. The modern representatives of this family (*Gleicheniaceae*) are found in the American and Asian tropics, although it is now apparent that they occupied a significant place in the landscapes of temperate regions in the Coal Age. Another interesting fern was described from the coal fields of Alabama (S. H. Mamay, 1955) which is characterized by having spore sacs of a primitive nature arranged along the margin of the leaflets instead of on the underside as in most living ferns. This fossil, assigned the new name *Acrangiophyllum*, cannot be positively identified with any known group of ferns, living or fossils, and is possibly transitional between the earlier land plants and some of the more clear-cut fern families of the Carboniferous. A beautifully preserved calamitean cone was described by R. W. Baxter (1955) from Iowa which adds to the rather rapidly growing list of plants belonging to this group. The calamites

constituted a very dominant and diverse element in the Coal Age forests and are represented today by the single genus *Equisetum*, commonly known as the horsetail rushes.

A Dutch worker (W. J. Jongmans, 1954) added a significant contribution to knowledge of the Carboniferous seed ferns in reporting leaves, seeds and pollen-bearing organs of a member of this group in organic connection. The seed ferns are important as probable forerunners of the modern flowering plants. Much of the knowledge of the group is based on scattered fragments of the various plant organs. Thus when these are found not merely associated but in actual connection it adds a significant note of confidence to understanding of this extinct group.

A contribution of particular interest to mineral collectors of the western states was a study of fossil woods from the Eden valley of Wyoming. H. O. Kruse (1954) described, from this well-known collecting area, 12 new species of petrified woods representing for the most part tropical trees whose modern equivalents are found far south of this Eocene Age locality. (See also BOTANY.)

Palestine: see ISRAEL; JORDAN; UNITED NATIONS.

Panamá. A republic on the isthmus joining the continents of North and South America, Panamá is bounded on the north by Costa Rica and on the south by Colombia, and is bisected by the Panama Canal Zone, which is leased to the United States. Area: 28,753 sq.mi.; pop.: (1950 census) 805,285, (1954 official est.) 886,000, both exclusive of the Canal Zone. The capital is Panamá city (pop. in 1950) 127,874; other principal cities are Colón 52,204; David 14,847; La Chorrera 8,652; Puerto Armuelles 5,734; and Santiago 5,886. Language Spanish; religion: predominantly Roman Catholic. President in 1955: Ricardo Arias Espinosa.

History.—Pres. José Antonio Remón's assassination on Jan. 2, 1955, ended a rare two-year period of political stability. Vice-Pres. José Ramón Guizado succeeded Remón, but within a few days the Panamanian national assembly had installed a third man as president, namely, Ricardo Arias Espinosa, who had been Remón's second vice-president.

The simple narration of these events cloaked a complicated and intriguing story. Investigations and arrests brought confessions. The confession of Rubén Miró, although later repudiated, was enough to convict Guizado in the impeachment proceedings and trial which were conducted by the national assembly. Miró, a disappointed minor governmental official, declared that he had done the actual killing of Remón with the promise from Guizado that he would be made minister of the interior and justice.

Speculation centred on several unexplained elements in the case. Rubén Miró, although bound over to the civil courts as a common criminal, had not yet been tried by late November. His confession had convicted Guizado as an accomplice, despite Panamanian judicial procedure which forbids the trial of an accomplice before that of a principal. Although Guizado had been

tried by the national assembly, his partisans were attempting to force court action which would set him free.

After extended negotiations, ratification formalities of the new treaty of mutual understanding and co-operation with the United States were completed on Aug. 23, 1955. The treaty brought Panamá several important economic advantages: (1) the annuity paid for the use of the Panama canal was raised from \$430,000 to \$1,930,000; (2) Panaman residents who work in the Canal Zone would no longer be permitted to trade in Canal Zone commissaries, a ruling which was expected to transfer an estimated \$12,000,000 to \$15,000,000 annually in retail trade to Panaman merchants; (3) valuable real-estate holdings were turned over to Panamá, particularly the railroad yards in Panamá city, which were to be cleared away to provide space for new office buildings; (4) uniform wages for all employees were to become effective when approved by the U.S. congress; and (5) Canal Zone authorities would purchase a larger percentage of local supplies from Panamá.

An extensive program was under way to improve the country's highways. Following the good-will visit of U.S. Vice-Pres. Richard M. Nixon in February, appropriations were approved in the U.S. congress which were expected to make it possible to complete the Inter-American highway as far as Panamá city within three years. A \$9,650,000 project to repair and extend 635 mi. of local roads was being financed by the International Bank for Reconstruction and Development and two commercial banks. (R. HN.)

Education.—In the school year 1953-54 there were 1,050 public and private primary schools with 125,428 pupils enrolled, and 76 public and private secondary schools with 24,222 students. The national university had 1,735 students. The 1950 census showed that 28.3% of the population over ten years of age, excluding tribal Indians, was illiterate. About 22.4% of the 1955 budget was earmarked for education.

Finance.—The monetary unit is the balboa, at par with the U.S. dollar. The national budget for 1955 balanced ordinary revenue and expenditure at \$43,947,774 and extraordinary revenue and expenditure at \$2,211,275. Total revenue in 1954 was \$44,782,979; expenditure, \$48,817,759. The national debt on Dec. 31, 1954, totalled \$41,947,320, of which \$11,124,601 was external. Demand deposits totalled \$33,400,000 on March 31,

1955. The cost-of-living index (Panamá city) stood at 94 in March 1955 (1948=100).

Trade and Communications.—Domestic exports in 1954 totalled \$17,431,298; re-exports \$1,975,665; imports \$72,620,601. The leading customers were the U.S. (93%), Venezuela (2%) and Colombia (2%); leading suppliers, the U.S. (62%), the Canal Zone (9%), Colón free trade zone (5%), U.K. (4%) and Germany (3%). Chief exports were bananas (56%), cacao (17%), fresh shrimp (12%), abacá (4%) and lumber (3%). The traditionally adverse balance of trade is generally offset by invisible exports to the Canal Zone in the form of tourist expenditures, sales to ships and wages of Panamanians employed there.

Railway mileage is 220. Highways in 1955 totalled 1,350 mi., of which 440 mi. were paved. Motor vehicles totalled 18,012 on Jan. 1, 1955, including 12,677 automobiles and 5,335 trucks and buses. According to *Lloyd's Register of Shipping*, 598 vessels (100 tons and more) aggregating 4,099,186 gross tons were registered under the Panaman flag on June 30, 1954.

Agriculture.—Exports of bananas in 1954 were 5,699,809 stems, almost all of which went to the U.S. Exports of other export crops included cacao 2,627 metric tons; abacá 1,643 tons; coconuts 6,043,200 nuts. Production of rice in the 1954-55 season was about 220,000,000 lb.; sugar 38,000,000 lb. The 1950 livestock census showed 576,488 cattle and 198,111 hogs. In 1954, 1,850 metric tons of fresh shrimp and 4,031,408 sq.ft. of lumber were exported.

Manufactures.—In 1954, 105,600,000 kw.hr. of electric energy and 19,440,000 cu.m. of manufactured gas were produced in Panamá city and Colón. Production of rum was 672,123 l.; beer 15,419,230 l.

See J. and M. Biesanz, *The People of Panama* (New York, 1955). (J. W. Mw.)

Panama Canal Zone. A United States military reservation embracing a 10-mi. strip across the Isthmus of Panamá, leased for the protection and administration of the Panama canal, the Panama Canal Zone has an area of 553 sq.mi., including 191 sq.mi. of fresh water. Population: (1950 census, inclusive of uniformed military personnel) 52,822; (1954 est.) 58,000. The largest city is Silver City, which in 1950 had 5,726 inhabitants. La Boca (4,235), Balboa (4,162) and North Gamboa (3,074) were next largest. Administrative centre: Balboa Heights (pop., 1950, 363). Governor in 1955: Brig. Gen. John S. Seybold.

History.—The new treaty governing relations between the United States and Panamá concerning the Canal Zone (see PANAMÁ) went into effect on Aug. 23, 1955. Panamá gained economic concessions which would substantially increase its income from Canal Zone operations. The lives of about 17,000 Canal Zone workers who live in Panamá were also affected. Whereas they were to receive equal pay for equal work (when approved by the U.S. congress), they would no longer be permitted to trade in Canal Zone commissaries and they would be subject to Panaman income tax laws.

In line with a continuing campaign to keep toll charges at a minimum, U.S. shipping interests opposed the treaty provision which increased the annuity payment to Panamá for use of the Canal Zone because the additional \$1,500,000 would be reflected in higher tolls. In addition, the formula used by the Panama Canal company for computing tolls was being attacked by action on both the judicial and legislative fronts. The Panama Canal company, a semiautonomous government corporation under which all commercial Canal Zone activities were consolidated in 1951, was sued on Sept. 13 by a group of 12 steamship companies in an attempt to recover \$27,000,000 in tolls which they alleged the Canal company had collected illegally. Figures of the U.S. general accounting office which completed an audit in May 1955 revealed that the Canal company had consistently set toll charges high enough to compensate for losses sustained in the operation of such nontransit activities as a railroad, a steamship line, two hotels and ship repair facilities. The steamship companies maintained that nontransit losses could not be included legally in the toll charges.

In congress, shipping interests were pushing legislation which would explicitly direct the Canal company to refrain from including nontransit losses in toll computation. On the other hand, while the general accounting office had indicated that tolls may have been computed contrary to the present law, it had recommended that the law be modified so that the Canal com-

FORMER PRESIDENT OF PANAMÁ, José Ramón Guizado (sitting, foreground), as he was indicted for the murder of his predecessor, J. A. Remón, Feb. 16, 1955, before the national assembly of Panamá. Remón's picture appears on the poster above the assembly president and deputy

FIRST SOVIET SHIP to pass through the Panama canal since 1949 shown in the locks May 14, 1955

pany could continue its present practice.

After new records for canal traffic had been made during the Korean war, it was thought there would be a marked decline. During 1955, new records were set in March, when 709 vessels used the canal, and again in July, when the total rose to 731.

Work continued on the project to remove about 2,000,000 cu.yd. of rock from Contractor's hill above Gaillard cut to prevent landslides. Modernization of Gatun lock was completed in April. Its capacity was increased from 23 to 29 ships per day.

(R. HN.)

Education.—In the fiscal year ending June 30, 1954, there were for U.S. children 15 schools with average daily attendance of 5,485 and a junior college, and for Latin-American children 12 schools with average daily attendance of 3,824 and a junior college.

Canal Traffic.—During the fiscal year ending June 30, 1954, 7,784 commercial vessels (300 net tons and over), aggregating 38,027,812 canal net tons, and 800 U.S. government vessels passed through the canal. The commercial vessels carried cargo aggregating 39,095,067 long tons and paid tolls totalling \$33,247,864. Of the cargo carried, 20,717,343 tons were from Pacific to Atlantic and 18,377,724 from Atlantic to Pacific. Major commodities in the Pacific-Atlantic traffic were ores 5,053,296 tons, lumber 3,716,307 tons and wheat 2,168,247 tons; in the Atlantic-Pacific traffic, mineral oils 4,486,041 tons, coal and coke 3,374,243 tons and iron and steel manufactures 1,843,022 tons. Of the 7,784 commercial ships passing through the canal, 2,056 were U.S., 1,265 British, 831 Norwegian, 611 Panaman, 387 Japanese, 347 Honduran, 323 German, 275 Danish, 230 Swedish and 224 Liberian; the remaining 1,235 were of 23 other nationalities.

Pan American Union: see ORGANIZATION OF AMERICAN STATES.

Paper and Pulp Industry. The estimated production of paper and paperboard in the United States for 1955 was about 28,000,000 tons, based on the total production by midyear. Production at the end of the fifth month was 10% above 1954. Nearly all mills had made some increase in producing ability. The per capita consumption for the U.S. population at the end of 1954 was 383.7 pounds. In 1954,

1954	984,650	1,605,568	1,361,746	165,377	5,279,126	9,396,467

439,000 tons of wood pulp and 686,000 tons of paper were exported. In the first five months of 1955 wood pulp exports were 172% greater than for the same period in 1954. Wood pulp production established a new record in 1954, totalling 18,341,000 tons. In the first five months of 1955 wood pulp production was 8,523,000 tons or 1,100,000 tons more than in the same period in 1954. About 30 new machines were on order in 1955.

Canada.—The total output of Canadian paper mills during 1954 was 7,642,000 tons of which 5,661,000 tons were exported. The output was 5% greater than in 1953. The total wood pulp production in 1954 was 9,500,000 tons. Production of pulp from rags, wastepaper and straw amounted to 400,000 tons. Canada led all other countries in total volume of pulp and paper exports. A new record production of 5,984,207 tons of newsprint was reached in 1954. Pulpwood consumption of 12,000,000 cords exceeded the 1953 cut of 11,600,000 cords. Exports of pulpwood declined in 1954 to 1,700,000 cords, the lowest figure since 1949.

United Kingdom.—Chemical pulp consumption in Great Britain in 1954 exceeded for the first time the production of prewar 1940. The paper and board industry operated at the highest level in history. Total pulp imports in 1954 amounted to 2,149,000 tons and showed signs of continuing at the same or higher rate in 1955. The 209 paper and board mills, excluding

building boards, totalled 3,391,000 tons. Of this amount 26% was book and writing grades, more than 20% was newsprint, about 27% paperboard, more than 7% kraft papers and less than 2% was sulphite papers tissue and cigarette paper.

(R. G. M.)

Table I.—U.S. Production and Consumption of Paper, Wood Pulp and Pulpwood

Papua-New Guinea. The territory of Papua and trust territory of New Guinea, occupying the southeast and northeast quarters respectively of the island of New Guinea, are administered with dependent islands as one area by Australia. Areas and populations are as shown in the table.

Territory	Area (sq.mi.)	Population (mid-1953 est.)	
		Native	Non-native*
Papua†	90,540	392,709	4,691
New Guinea‡	70,000	1,100,000§	10,758
Islands included in trust territory	23,000	185,430	
Total.	183,540	1,700,000§	15,449

*About 80% Australian, 15% Chinese. †Including d'Entrecasteaux, Louisiade, and Trobriand (with Woodlark) Islands (total area 2,754 sq.mi.). ‡Including adjacent minor islands. §1954 est. ||Bismarck archipelago (including New Britain 14,100 sq.mi., New Ireland 3,800 sq.mi., Lavongai 460 sq.mi., Admiralty Islands 800 sq.mi.) and some of Solomon Islands (including Bougainville 4,100 sq.mi.).

Native pop., Papuan and (especially in Bismarcks, Solomons and coastal New Guinea) Melanesian; Negrito and Micronesian minorities. Religion: pagan with Christian minorities. Capital of joint administration, Port Moresby (pop. about 13,800). Administrator in 1955, Brig. D. M. Cleland.

History.—Capital works planned in Papua and New Guinea in 1955–56 included power and water supplies, schools and roads. In 1955 progress was continued in bringing remote tribes within the orbit of administration and in the further planting of relatively new cash crops, including tea, rice, and coffee. Possibly of the greatest importance, a major Australian candy manufacturer bought 1,050 ac. near Lae for an experimental cocoa plantation. An unprecedented atmosphere of prosperity stemmed from continued high prices for copra and ever-growing spending by oil exploration expeditions.

The administration persevered with village councils. But the United Nations Trusteeship council chided Australia for not interesting the better-educated natives more effectively in the councils. The trusteeship council also suggested that the natives should have direct taxation levied on them as a contribution toward costs of administration. (R. J. GE.)

Education.—(1953) *Papua.*—Administration schools 29, pupils 1,617; mission schools 846, pupils 43,708. *New Guinea.*—Administration schools 76, pupils 3,949; mission schools 2,643, pupils 83,506.

Economy.—*Papua.*—Agriculture.—Production: rubber (exports, 1954) 1,520 metric tons, copra (1952–53) 10,279 tons; coconuts (desiccated, exports 1952–53) 1,335.69 tons. Finance and Trade.—(1952–53) Revenue £A2,777,271, expenditure £A2,808,095. Imports £A4,918,269, exports £A2,322,905. Chief imports: foodstuffs, metal manufactures. Chief exports (1952–53): copra £A848,177, rubber £A736,073, desiccated coconut £A320,073.

New Guinea.—Agriculture, Forestry and Mining.—Production (1952–53): coconut oil (export) 3,568 tons, copra 61,782 tons, cocoa beans 0,096 cwt., coffee beans 664 cwt. Finance and Trade.—Internal revenue (1952–53) £A1,544,542 (Australian government grant £A2,769,543); expenditure £A4,314,085. Total imports (1952–53) £A7,175,612, exports including exports not of local origin) £A8,491,396. Principal exports: copra £A4,425,057, gold £A2,147,766, coconut products £A523,032, cocoa beans £A171,876, shell £A87,894, timber £A751,833. Principal imports: foodstuffs £A2,043,006, metals and metal manufactures £A1,942,728, clothing and textiles £A811,195.

Currency.—Australian pound used throughout Papua-New Guinea (£A1.25=£1 sterling).

Paraguay. A landlocked republic in central South America, bounded north and east by Brazil, north and west by Bolivia and south by Argentina. Area: 157,047 sq.mi., of which 95,338 sq.mi. constitutes the sparsely populated Chaco, while the 61,709 sq.mi. lying east of the Paraguay river contains 5% of the population and activity. Pop.: (1950 census) 1,408,000; (1955 est.) 1,577,000. The people are a homogeneous amalgam of Spanish and Guaraní stock, with some Portuguese and Italian, which has developed into a racial type. Official language: Spanish. The Guaraní tongue has survived more than the blood, but is secondary and recessive. Capital and chief centre: Asunción, pop. (1950) 201,340. Other large cities (1950 census): Villarrica 14,680, Concepción 14,640, Encarnación 13,321. Official religion: Roman Catholic. President in 1955: Gen. Alfredo Stroessner, also commander of the armed forces.

History.—General Stroessner's half-military cabinet remained unchanged despite an abortive conspiracy by dissident Colorados early in 1955. In July 1955 400 army officers joined the Colorado party, and Liberals who opposed this as against statute were exiled. Poor crops and poor river transport forced a continuation of many of the directed-economy controls which the regime had taken power to abolish; but it administered them to favour the consumer class and avoided labour difficulties. Reduced production of cotton, cattle, quebracho and yerba maté stimulated diversification of activities by the large entrepreneurs; and extensive Brazilian and U.S. coffee plantations in the northeast approached the bearing stage. A foreign investment code in 1955 offered many fiscal and financial advantages to outside capital to organize new industries.

Externally Paraguay's economic union treaty with Argentina was operated effectively to augment trade with that country, and arrangements for its implementation were expanded. Gen. Juan Perón secured temporary asylum at Asunción in Oct. 1955. Brazil's offer of a trade agreement and hydroelectric installations was not accepted, but Brazil continued aid for two highways to give Paraguay access to Brazilian roads, railways and Atlantic ports. Uruguay extended warehouse facilities for Paraguayan exports. Cultural and economic pacts were made with Uruguay and Bolivia, and Paraguay joined UNESCO. Balance of payments agreements with France and Germany led to misunderstandings. The Export-Import Bank of Washington granted a credit of \$7,200,000 for sewer construction at Asunción and a \$700,000 credit for airfield improvement, and the technical co-operation agreement with the U.S. functioned extensively and actively. A number of Paraguayans in Argentina were induced to return by land grants, and 40 Japanese families were added to the Japanese farm colonies.

Education.—In 1953 there were 1,794 elementary schools, with 252,393 pupils; 87 secondary schools, with 13,420 pupils, plus a number of secondary schools under varied religious auspices. The national university at Asunción, comprising eight faculties, had more than 2,100 pupils. The budget for public education was increased in 1955 by 17% over the 1954 budget of 93,588,264 guaraníes (nine months).

Finance.—The monetary unit is the guaraní, whose gold value since Aug. 1954 had been 21 guaraníes per U.S. dollar. The official free rate in May 1955 was 64.50 guaraníes per dollar and the exchange-house rate 70. An elaborate system of special exchange rates and controls by the Central bank regulates imports and exports. Exchange reserves were \$12,000,000 early in 1954 and \$4,000,000 in mid-1955. The national budget, March 1955, was 950,000,000 guaraníes, up 25% from the previous year. Government revenues rose strongly after 1952, because of efficient collection. The internal public debt in 1953 was 268,000,000 guaraníes, compared with 79,000,000 guaraníes five years earlier. The external debt was \$9,620,000 in 1953, compared with \$12,401,700 in 1949. Circulating mediums in 1953 consisted of 478,000,000 guaraníes currency and 539,000,000 guaraníes in demand deposits. The currency (notes) in 1954 was 660,000,000 guaraníes. Public credits by the Central bank in 1953 were 608,000,000 guaraníes, and by its affiliate the Bank of Paraguay 382,000,000 guaraníes. Asunción's branch banks of Argentine, British and Brazilian nationality had total loans outstanding early in 1954 of 75,000,000 guaraníes.

Trade.—Paraguay's exports in 1954 were valued at \$33,970,000 and its imports at \$32,884,000. Lumber exports were approximately \$10,000,000, cotton \$7,000,000, quebracho \$4,000,000, oleaginous products \$3,000,000 and meat products \$2,000,000. Other characteristic exports were tobacco, yerba maté, essential oils and cane-juice rum. The leading imports were petroleum products, textiles, machinery, breadstuffs, vehicles, drugs and a wide range of manufactured goods. The leading destinations of exports and sources of imports, by countries and percentages, were as

Countries	Per cent exports	Per cent imports	Countries	Per cent exports	Per cent imports
Argentina	43.4	28.0	Netherlands . . .	5.7	2.5
United States . . .	18.6	19.7	Germany	2.8	8.4
Uruguay	9.3	8.7	Belgium	2.3	1.3
United Kingdom . .	8.2	9.7	France8	7.0

shown in the table. The excess of imports in 1955 produced an exchange shortage which brought drastic import curtailments through official exchange manipulation.

Communications.—Paraguay has 700 mi. of railways. The British-controlled Paraguay Central has 296 mi. traversing the most populated area from Asunción to Encarnación, and in 1954 it carried 2,000,000 passengers and 150,000 tons of freight. Private company railways, to connect with the river or Central, have more than 400 mi. and carry more freight than the Central. The all-weather highway mileage is 628, while seasonal roads and ox-cart roads have about 4,000 mi. In 1954 there were only 2,300 passenger automobiles, with an equal number of trucks

and about 500 buses. Paraguay has excellent international air-line connections, the Asunción airport having handled 3,000 flights in 1954, 1,000 of which were internal. The Paraguayan state merchant fleet had in 1955 a total tonnage of about 5,000. In 1950 the river freight movement was 35,000 tons, three-fourths exports. The number of telephones was 6,500, all government-operated, with both land-line and radio-telephone circuits to Argentina. There were 3,500 mi. of telegraphs, mainly state-owned, with radio-telegraph connections to nearby countries. There were ten small radio stations and 40,000 radio sets.

Agriculture.—Leading farm crops in 1953, in tons, were: mandioca 991,300, sugar cane 342,000, maize 107,000, sweet potatoes 76,000, cotton 38,000, cowpeas 18,000, rice 17,000, peanuts 10,000 and tobacco 9,000. Citrus production in 1952 was 1,080,000,000 fruit, mainly oranges. Cattle in 1953 numbered 4,200,000, horses 322,000, sheep 218,000 and donkeys 25,000; there were 2,600,000 domestic fowls.

Manufactures.—Typical leading manufactures in 1952 or 1953 were: wheat products 50,000 tons, cotton cloth 15,500,000 yd., quebracho 35,000 tons, sugar 23,000 tons, yerba maté 12,000 tons and liquors 19,080,000 l. Other manufactures of substantial importance were leather, glass and ceramics, soap, essential and vegetable oils, alcohol, tobacco products, shoes, pharmaceuticals, brushes, lace and printed matter.

Mines and Forests.—Paraguay has virtually no metals, petroleum or coal. Brick and tile production in 1953 were 48,000,000 units, cobblestones and crushed rock 50,000 cu.yd., lime 12,000 tons and cement 4,200 tons. Logs and beams exported in 1953 were 160,000 tons and lumber (export plus domestic) 19,000 tons, mostly tropical hardwoods and semihardwoods. In 1955 the forest industries were much reduced, and plywood was discontinued. (W. Fr.)

Parents and Teachers, National Congress of: see SOCIETIES AND ASSOCIATIONS, U.S.

Paris. Capital and largest city of France, Paris had by the 1954 census 2,850,139 inhabitants, compared with 2,725,374 in 1946.

The ordinary budget for Paris, voted on Jan. 1, 1955, amounted to 71,988,000,000 fr.; i.e., 5,000,000,000 fr. more than in 1954. The cost-of-living index throughout 1955 was much the same as in the year before. The municipal council was still concerned about the problem of housing and various aspects of urban development. According to the over-all plan promoted by the minister for reconstruction and housing, Roger Duchet, Paris and the Paris region were to have 21,000 new housing units. New housing blocks were erected by the Paris Building authority on the "green belt," notably at the Porte de Vincennes and at the Porte de Montreuil. In the Courbevoie-Nanterre-Puteaux sector much development was planned, namely, the reconstruction

of the Rond-Point de la Défense as a site for international exhibitions; and an exhibition hall was being built there for the national centre of industry and technical processes. As a step toward solving the traffic problem, the establishment of new government offices in the centre of Paris was prohibited.

The volume of motor traffic continued to increase, and it was difficult to see what could be done. There was talk of levying a parking tax on vehicles in the central quarters. Apart from this, a tunnel was being constructed under the Place de l'Alma, and the carriageway of the Avenue de l'Opéra was being widened. Another problem was to find accommodation for primary and secondary schools. Since 1954 the number of school children had increased by about 36,000, and although 300 new schools had been provided, classrooms were nevertheless overcrowded.

Paris had still a great attraction for foreign tourists: about 1,500,000 came in 1954 and 618,000 in the first six months of 1955. On July 3 the centenary of the Jardin d'Acclimatation was celebrated, and early in May the Square Opéra-Louis Jouvet was opened, commemorating the great actor.

The closing of the Café de Paris, the well-known restaurant in the Avenue de l'Opéra, must finally be recorded. (A. Pr.)

Patents. During the fiscal year ending June 30, 1955, the United States patent office granted 32,308 patents, including 2,533 for designs, 116 for plants and 186 reissues. This was 9,018 less than the number issued in 1954.

Applications for patents filed in the patent office for the fiscal year totalled 84,233, exceeding the number filed in the previous year by 3,461; the number for so-called mechanical inventions (78,480) was the highest filed in any year since 1931. The total number of patent applications pending on June 30, 1955, was approximately 221,872, of which about 139,614 were awaiting action by the office, the remainder being under rejection awaiting response by applicants, or in interference or appeal proceedings.

Trade-marks registered (16,109) and renewed (4,588) during 1955 totalled 20,697 compared with 18,115 during the preceding year. On June 30, 1955, approximately 26,234 applications for registration, renewal and republication were pending in the office of which slightly less than half (12,527) were pending before the examiners.

Employment in the patent office on June 30, 1955, stood at 1,612, an increase of 33 over the 1,579 figure a year earlier.

By June 30, 1955, the patent office had granted more than 2,700,000 patents since the consecutive numbering system began in 1836. Complete classified and numerical sets of United States patents are available for the use of the public in the patent office search room. Information concerning the patents issued each week is contained in the *Official Gazette* of the United States patent office, which is available for reference in approximately 340 of the more than 550 government depository libraries in nearly every state of the United States. Copies of patents may be seen in 22 libraries in the country. Printed copies of patents are sold for 25 cents each, designs and trade-marks for 10 cents each. During the 1955 fiscal year the patent office distributed nearly 7,000,000 copies of United States patents and trade-marks, selling more than 4,500,000 copies to the public, depositing 650,000 in libraries throughout the United States and shipping more than 1,100,000 to foreign countries under exchange agreements.

On Oct. 22, 1954, the secretary of commerce announced the

"WELL, AND HOW ARE ALL THE FUTURE PREMIERS TODAY?" a 1955 cartoon by Fischetti of NEA Service, Inc.

appointment of an Advisory Committee, headed by Vannevar Bush, on the Application of Machines to Patent Office Operations. This committee studied the possible application of high-speed electronic devices to replace time consuming manual sorting and searching of reference material which is essential in the examination of patent applications. The committee's report was submitted to the secretary of commerce on Dec. 22, 1954, and copies were made available for purchase for \$1 each from the sales and distribution division, department of commerce.

A notice of proposed amendment of the trade-mark rules of the patent office was published in the *Federal Register* of Aug. 21, 1954. After consideration of comments received pursuant to said notice, revised Rules of Practice in Trade-mark Cases, becoming effective Aug. 15, 1955, were promulgated by publication in the *Federal Register* (July 7, 1955).

Net receipts for the fiscal year ended June 30, 1955, were \$5,860,833. Obligations incurred under all patent office appropriations amounted to \$11,631,060, compared with \$11,933,934.40 for the preceding year. (R. C. W.)

Peaches: see FRUIT.

Peanuts. The U.S. 1955 crop of picked and threshed peanuts was indicated at 1,738,725,000 lb., 70% larger than the drought-reduced 1,023,070,000 lb. of 1954, but less than the 1,921,095,000-lb. average of 1944-53. The 1,656,000 ac. for harvest, 19% more than 1954, but much below the 2,562,000 ac. average for 1944-53, reflected an increase of 7.5% in the 1,610,000 ac. initially allocated, plus picking and threshing of a greater percentage of the allocated acreage. The average yield of 1,057 lb. per acre was a new record high; the 1954 yield was 737 lb. per acre and the average for 1944-53 was 784 lb. per ac.

Production in the Virginia-North Carolina area of the large-type eating peanut was indicated at 470,950,000 lb. as com-

U.S. Peanut Production by Leading States

State	(In thousands of pounds)		Average 1944-53
	Indicated 1955	1954	
Georgia	599,850	276,750	657,004
North Carolina	259,350	251,980	297,142
Texas	237,250	108,185	272,522
Alabama	236,500	110,550	280,931
Virginia	209,050	174,900	207,413
Oklahoma	108,000	38,540	110,572
Florida	65,250	44,550	60,206

pared with 429,055,000 lb. in 1954 and an average of 508,502,000 lb. The yield of 1,580 lb. per acre was high as compared with 1,527 lb. in 1954 or 1,296 lb. per acre average for 1944-53. Production of 915,025,000 lb. in the southeast area was high as compared with 439,290,000 lb. in 1954, but below the 10-year average of 1,017,286,000 lb. The southwest area crop of 352,750,000 lb. was more than double the 154,725,000 lb. of 1954, but less than average.

The national average support price was 12.2 cents per pound, and the average price received by producers in October was 11.8 cents as compared with 11.6 cents per pound a year earlier. Instead of usual substantial exports, the import quota for the year was increased from 1,709,000 lb. to 51,000,000 lb. in March, followed by removal in May of all restrictions on the quantities of shelled peanuts which might be imported. But the inadequate 1955 crop was expected to result in consumption per capita returning to more than 6 lb. and 450,000,000 lb. becoming available for crushing, exports or additions to stocks.

Marketing quotas were continued on the 1956 crop and the acreage allotment set at 1,610,000 ac., the same as the initial acreage allocation on the 1955 crop.

The world peanut crop of 1955 was forecast at a record 12,132,500 tons, as compared with 11,517,500 tons in 1954 and an average 9,569,000 tons in 1935-39. Leading producers were:

India, 4,256,000 tons; China, 2,400,000 tons; French West Africa, 990,000 tons; Nigeria and Cameroons, 950,000 tons and the United States, 869,400 tons. (J. K. R.)

Pears: see FRUIT.

Pecans: see NUTS.

Penicillin: see MEDICINE.

Pennsylvania. A middle Atlantic state and one of the 13 original states of the union, the commonwealth of Pennsylvania is popularly known as the "Keystone state." Area: 45,333 sq.mi., including 288 sq.mi. of inland waters. Pop.: (U.S. census, 1950) 10,498,012; (July 1, 1955, est.) 11,132,000. Capital: Harrisburg, pop. (1950) 89,554. Other cities with population greater than 75,000 in 1950: Philadelphia, 2,071,605; Pittsburgh, 676,806; Erie, 130,803; Scranton, 125,536; Reading, 109,320; Allentown, 106,756; Altoona, 77,177; Wilkes-Barre, 76,826. The urban population in 1950 numbered 7,403,036 and the rural 3,094,976.

History.—In 1954, for the first time in 20 years, a Democratic candidate was elected governor of Pennsylvania. George M. Leader was elected over the Republican candidate, Lloyd H. Wood, by a vote of 1,996,268 to 1,717,070. Governor Leader assumed office on Jan. 18, 1955.

The essential elements in the governor's program before the Pennsylvania 1955 general assembly were: (1) To restore fiscal solvency to the commonwealth by overcoming deficits and debts amounting to \$510,604,474 through proposing the adoption of classified income-tax legislation. (2) To reorganize the duplicative and unco-ordinated administrative agencies and departments of the executive arm of the state government through the adoption of a reorganization act. This act was passed by the general assembly. (3) To resuscitate the economy in the nine major employment crisis areas in the state by the establishment of a state industrial development authority. (4) To expand and improve the social welfare, public assistance and educational services of the state administration. The governor sponsored a program for creating diagnostic clinics and treatment centres in general hospitals throughout the state. He also proposed to the general assembly a reorganization of the state's public educational system to provide for the training and guidance of physically and mentally handicapped children, who were estimated to be one out of five of the school population.

The state's chief elective officials in 1955 were: George M. Leader (Democrat), governor; Roy E. Furman (Democrat), lieutenant governor; Charles R. Barber (Republican), auditor general; Weldon B. Heyburn (Republican), state treasurer; and Genevieve Blatt (Democrat), secretary of internal affairs. Ralph C. Swan was acting superintendent of public instruction.

Education.—Statistics for 1953-54 showed a net enrolment of 1,707,342 pupils, including 86,189 in kindergarten, 1,012,984 in the elementary division apart from kindergarten, and 608,169 in secondary school. During 1953-54 there were 1,431 kindergarten teachers, 32,932 elementary teachers and 26,249 secondary or high school teachers; 1,267 elementary principals, 944 secondary school principals and 651 supervising principals; 985 supervisors; and 2,342 other professional employees in the public school system. The state administration estimated that 50.38% of its total 1955-57 biennial general fund budget, or \$623,462,352, would be expended on public education. In 1955 Pennsylvania had 101 institutions of higher education; colleges and universities numbered 76.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the first six months of 1955 expenditures by the department of public assistance reached \$65,388,000, including \$38,827,000 of state funds and \$26,561,000 of federal funds. The assistance rolls contained an average of 143,346 cases, including 57,048 cases of old-age assistance, 29,194 cases receiving aid to dependent children, 28,039 general assistance cases, 16,385 blind pensioners and 12,680 cases receiving aid for the permanently and totally disabled.

Seven institutions comprised the state penal and correctional system. Ten medical and surgical hospitals are state-owned, for the support of which \$13,790,000 was granted by the general assembly in the 1953-55 session. A budgetary request of \$17,157,138 was recommended for the 1955-57 biennium. The budget of the state mental hospital program, involving 21 institutions with approximately 42,000 mental patients, was

estimated at \$106,888,500, an increase of \$16,173,500 over the previous biennial expenditures. Four state institutions were operating exclusively for the care of the mentally retarded with a 1955-57 estimated budget of \$23,750,000. The newly constructed Eastern Psychiatric institute was to begin full operation early in 1956, concentrating on research and training.

Transportation.—Of the 100,695 mi. of highways in Pennsylvania in 1954, 41,080 mi. were in the state highway system under the supervision of the department of highways. Included in this total were 637 mi. in the cities of Pennsylvania and 2,370 mi. in the boroughs. The Pennsylvania Turnpike, by 1955 consisting of 360 mi. of highway, operated by the Pennsylvania Turnpike commission, now stretched from the Delaware river to the Ohio state line. There were 11,136.24 mi. of railroads in operation in Pennsylvania in 1953.

Banking and Finance.—As of Dec. 31, 1954, 317 banking institutions operated under state charters, with total resources of \$7,026,773,417.62. There were 843 insured commercial banks, of which 550 were national banks, 94 were state banks with membership in the federal reserve system and 199 were state banks not members of the federal reserve system. Seven insured mutual savings banks also functioned in the state. The total assets and liabilities of insured commercial banks in Pennsylvania on Dec. 31, 1954, were \$13,530,752,000. The number of depositors in all state banking institutions was 4,753,864. As of Dec. 31, 1954, 733 building and loan associations with assets of \$895,738,473.55 were operating in the commonwealth.

The total 1955-57 appropriations proposed by the state administration to the Pennsylvania general assembly from the general fund amounted to \$1,312,197,463. Appropriations and allocations from the motor licence fund for 1955-57 were estimated at \$494,165,656. The gross bonded debt of the commonwealth as of Sept. 1, 1954, stood at \$415,150,000. An additional estimated deficit for the last biennial state operations was \$74,732,533.

Table I.—Principal Crops of Pennsylvania

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	58,480,000	63,204,000	59,537,000
All wheat, bu.	16,172,000	19,796,000	19,856,000

Agriculture.—According to the 1950 federal census, the commonwealth had 146,887 farms, among which 43,833 were devoted to dairy activity. In 1954 the total value of Pennsylvania's agriculture amounted to \$1,983,000,000. The farms of Pennsylvania covered 14,112,841 ac., 49% of the total land area. In 1954 Pennsylvania ranked 14th in total cash income from farm marketings, with \$748,860,000 in agricultural earnings. Thirty-five per cent was derived from dairy products, while 28% was obtained from poultry and eggs. The income from all livestock and poultry amounted to \$573,495,000 or 77% of the total farm cash income.

The value of fruits and crops totalled \$346,598,000 for 1954, compared with the revised estimate of \$307,896,000 for 1953.

Manufacturing.—According to the records of the state department of labour and industry, the business and industrial establishments of the commonwealth covered by the Pennsylvania unemployment compensation law at the end of 1954 totalled 196,000 concerns, employing an average of 3,020,808 workers earning \$11,066,855,000 in wages and salaries during that year. It was estimated that 20,100 manufacturing companies operated during 1954, with 1,470,343 workers engaged in manufacturing getting \$5,900,940,000 in earnings for these 12 months. By a 1953 estimate, Pennsylvania's industrial establishments produced \$24,600,421,000 worth of products for the U.S. market.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Pennsylvania in 1952 and 1953 (pre-

Perón, Juan Domingo (1895—), president of Argentina, was born on Oct. 8 near Lobos, south of Buenos Aires, and was educated in military schools. He became one of the leaders of a nationalist clique of young army officers who in 1943 helped overthrow the regime of Pres. Ramón S. Castillo. Perón became war minister and later vice-president under Pres. Edelmiro Farrell, and in 1946 was himself elected president on the Labour party ticket. In 1949 a constitutional change was accomplished which permitted Perón to succeed himself, and in Nov. 1951 he was re-elected president for a second term and was inaugurated on June 4, 1952.

Late the following month his wife, Eva, died. She had wielded an extraordinary political influence in Argentina on behalf of her husband, through the María Eva Duarte de Perón Welfare foundation and through her leadership in national labour groups, and among the so-called "shirtless ones" of the lower classes.

Friction which began in Nov. 1954 between Perón and the Catholic Church culminated in a short-lived revolt of the Argentine navy on June 16, 1955. The revolt was suppressed in Buenos Aires the same day, but Perón's position was obviously weakened and there were rumours of his impending resignation. He announced on July 15 that he had resigned as leader of the Peronista party but would remain as president of the nation. On Aug. 31 he offered to resign the presidency if that was necessary to keep the peace in Argentina, but he withdrew his offer a few hours later and threatened instead to wipe out his opposition.

A new revolt broke out on Sept. 16, and this time it was successful. Perón resigned three days later and sought political sanctuary aboard a Paraguayan gunboat anchored in Buenos Aires harbour. On Oct. 2 he flew to exile in Paraguay, but on Nov. 2 he left by plane, bound, it was announced, for Nicaragua.

Persia: see IRAN.

Peru. A republic situated on the west coast of South America, and bounded on the north by Ecuador and Colombia, on the east by Brazil and Bolivia, on the south by Chile and on the west by the Pacific ocean, Peru has an area of 506,189 sq.m.

The population, 9,396,000 according to a 1955 official estimate, is composed approximately of 52% "white" and mestizo and 46% Indian; there are also some Negro and Asiatic elements to the extent of about 2%. Lima, the capital, has a population (1952 est.) of 926,400. The population estimates for other major cities are: Callao, 104,500; Arequipa, 100,900; Cuzco, 84,400; Trujillo, 49,600; Iquitos, 44,000; Chiclayo, 41,600; Huancayo, 36,500; Sullana, 28,470; Ica, 27,300; and Piura, 15,600. Language: Spanish, although Quechua is still spoken by some of the highland Indians; religion: predominantly Roman Catholic. President in 1955: Gen. Manuel Odría.

History.—The Peruvian government under Pres. Manuel A. Odría maintained during 1955 a policy of tight political control and relative economic freedom. The stability of the regime and its liberal concessions to foreign capital provided a confident atmosphere in which investments increased and numerous developmental programs were undertaken. Exports in general were high, and the Peruvian sol remained steady at 19 to the U.S. dollar.

General Odría announced that for constitutional and personal reasons he would not be a candidate to succeed himself in the "free and democratic" election scheduled for June 1956. With conventional political parties languishing from seven years' inactivity and Victor Raoul Haya de la Torre's Apra (Alianza Popular Revolucionaria Americana) checked by the stringent law for the Security of the Republic, speculation centred on the identity of the candidate who would be selected by Odría to perpetuate his policies. Former President Manuel Prado y Fargateche was prominently mentioned in this connection. An antigovernment plot attributed to exiled Gen. Zenón Noriega was firmly suppressed in January, but by October there was talk of amnesty for the offenders.

Four U.S. firms, headed by the American Smelting and Refining company, formed a \$200,000,000 corporation to exploit the rich copper reserves at Toquepala in southern Peru. The Cerro de Pasco corporation hoped to make Peru one of the world's leading exporters of zinc in 1956 by investing more than \$80,000,000 to enlarge its refinery at La Oroya. Extensive exploration resulted in new petroleum discoveries in the northwestern part of the country. Construction was begun on a four-inch pipeline to connect Agua Caliente on the Pachitea river with Pucallpa on the Ucayali as part of a program to increase oil production in the montana region of eastern Peru.

Work continued on the hydroelectric plant and steel mill being built along the Santa river with French financial assistance. Advances were noted in the cement, tire, paper and match industries, and the guano industry experienced a revival. An \$18,000,000 irrigation project was initiated in northern coastal Peru with a loan from the International Bank for Reconstruction and Development. The bank also lent Peru \$5,000,000 to develop a modern service to maintain its recently expanded highway system. Peru and Bolivia jointly began surveys for a railroad along the southern shore of Lake Titicaca between Puno, Peru, and Guaqui, Bolivia.

Ecuador notified the Council of the Organization of American States in September that Peruvian forces were poised to attack, but investigation by the guarantors of the 1942 Rio de Janeiro protocol revealed no unusual activity along the frequently disputed frontier. Like Ecuador and Chile, Peru refused to submit its claim to sovereignty over a 200-mi. belt of coastal waters to the International Court of Justice. Several U.S. concerns paid fines for unauthorized fishing within the designated zone. Peru declined to join the International Sugar agreement, and its subsequent attempts to have its quota for sugar exports to the United States raised were only partially successful.

(R. HN.)

Education.—In 1953 there were 10,421 public primary schools with 23,147 teachers and 908,936 pupils and 1,348 private schools with 4,214 teachers and 137,900 pupils. The 114 public secondary schools had 2,686 teachers and 47,873 students; 204 private secondary schools had 3,100 teachers and 35,471 students. University education was available at four public universities—Lima (8,771 students in 1952), Arequipa (890), Cuzco (791) and Trujillo (1,616)—and the Catholic university of Lima (1,453).

Finance.—The monetary unit is the sol, valued at 5.26 cents U.S. currency, exchange certificate rate, and 5.20 cents, free rate, on Sept. 30, 1955. The 1955 budget was balanced at 3,264,758,000 soles. Actual revenue in 1954 (preliminary figures) was 3,357,000,000 soles; expenditure, 3,434,000,000 soles. The direct public debt on Dec. 31, 1953, totalled 1,859,194,890 soles, of which 361,674,020 soles represented the external debt. Currency in circulation (Aug. 31, 1955) totalled 1,622,000,000 soles; demand deposits, 2,485,000,000 soles. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$255,000,000, of which mining and smelting investments accounted for \$172,000,000. The cost-of-living index (Lima) stood at 183 in Aug. 1955 (1948=100). National income in 1953 was estimated at 17,205,000,000 soles.

Trade and Communications.—Exports in 1954 totalled 4,792,000,000 soles; imports, 4,916,314,000 soles. Leading exports were cotton (26%), sugar (13%), lead (11%), copper (7%) and petroleum and products (7%). Leading customers were the U.S. (36%), the U.K. (14%), Chile (11%), Belgium (6%) and Japan (6%); leading suppliers, the U.S. (52%), the U.K. (9%), Germany (8%), Argentina (7%) and Canada (3%).

Railroads (1951) totalled 2,800 mi.; highway mileage 19,466, of which 7,894 mi. were hard surfaced. On Jan. 1, 1955, there were 51,471 automobiles, 39,940 trucks and 4,940 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 52 vessels (100 tons and more) aggregating 103,000 gross tons on June 30, 1954. Telephones (Jan. 1, 1954) numbered 58,017, 83.4% of which were automatic and 71% of which were located in Lima.

Agriculture.—Production estimates in 1954 (preliminary figures) included cotton (ginned) 105,800 metric tons; sugar 635,000 tons; rice (milled) 170,300 tons; wheat 169,000 tons. In 1954, 84,434 tons of cotton and 457,691 tons of sugar and derivatives were exported. In 1952 there were 3,188,600 cattle, 15,903,800 sheep, 3,380,900 alpacas and llamas; (1951) 975,000 pigs and 1,150,000 goats. In 1954, 5,266 metric tons of wool were exported.

Minerals.—Production of the principal minerals in 1954 (preliminary figures) was as follows: copper (in ore) 41,510 short tons; lead 119,823 tons; zinc (in ore) 170,882 tons; silver 19,933,482 oz.; gold 147,278 oz.; antimony 932 tons; iron ore 2,170,000 tons. Petroleum production totalled 17,161,394 bbl. (J. W. Mw.)

Petroleum. Factors contributing during 1954 to the slower pace in the United States petroleum industry were a substantial decrease in exports, the decline in military requirements and the modest slump that was experienced in general business activity. Hence domestic crude-oil production declined and the amount of crude oil processed in refineries fell off, with a comparable decrease in the output of such key products as motor fuel and fuel oil. Nevertheless, continued crude-oil productivity and refinery capacity continued high, with drilling activity setting a new record of 53,000 wells, an increase of 3,500 over the preceding year, and operable refinery capacity at 8,379,000 bbl. daily, up approximately 372,000 bbl. U.S. crude-oil output in 1954 was 2,312,000,000 bbl., compared with 2,359,998,000 bbl. in 1953.

In the first nine months of 1955, crude-oil production was 1,839,000,000 bbl. compared with 1,737,000,000 bbl. for the corresponding period of 1954, and it was estimated that the year's production would probably exceed that of 1954 by about 6%.

TOTAL WORLD PRODUCTION OF PETROLEUM and output of four principal producing areas

rent consumption was double that of 1941 and 60% larger than in 1946.

Table II.—U.S. Petroleum Production

Year	Crude oil (000 bbl.)	Natural gas liquids* (000 bbl.)	Total liquid petroleum (000 bbl.)	Natural gas (000,000 cu.ft. gross)

Great as had been this U.S. increase, it was exceeded by the rate of increase in the consumption of petroleum products outside the United States, particularly in the last few years. It seemed probable that this demand would reach 15,500,000 bbl. per day by 1975, from an estimated 7,250,000 bbl. per day in 1955, which itself was two and a half times greater than the slightly more than 2,750,000 bbl. consumed daily in 1945. The reasons were the recovery in Europe from the effects of World

War II, increased industrialization and the drive to raise living standards throughout the world.

For the second consecutive year the combined production of the rest of the world in 1954 exceeded that of the United States. Total world production was 4,968,600,000 bbl., with the U.S. accounting for 46.53%. This compared with 4,747,207,000 bbl. in 1953, with the U.S. contributing 2,359,998,000 bbl. or 49.71%.

In the middle east alone, crude-oil reserves were estimated to be three times as large as those of the United States. According to *World Oil*, estimated reserves as of July 1, 1955, were as follows: United States, 30,060,000,000 bbl.; rest of North America, 4,402,500,000; South America, 12,377,500,000; Europe, 11,384,000,000; Africa, 115,000,000; middle east, 93,265,

Table I.—World Production of Crude Oil

(In 000 bbl.)					
Year	United States	Per cent	Rest of world	Per cent	Total world
1st 9 mo. 1955*	1,839,000	46.0	2,161,000	54.0	4,000,000
1st 9 mo. 1954*	1,737,000	47.1	1,953,000	52.9	3,690,000

petrochemical industry making alcohols, ethers, plastics, detergents, cloth fibres and fertilizers. It was estimated that the demand for oil in the United States would be likely to reach 14,000,000 bbl. daily by 1975, nearly 6,000,000 bbl. more than the estimated 8,330,000 bbl. daily consumption in 1955. 000,000; far east, 2,934,200,000; Australia-New Zealand, 1,000,000; total world, 154,539,200,000.

It was believed that the petroleum industry in the United States would again establish a new record for capital expenditures in 1955. The total approached \$6,000,000,000, largely reflecting expanded drilling and improvements and additions to refining facilities. The heavy outlay was an important factor in the expansion of the nation's economy and stemmed from record automobile output and the belief that the demand for petroleum products would grow in the United States at the average rate of 5% a year for the next ten years. In addition, U.S. companies operating abroad were steadily building up facilities to meet their demands. Capital expenditures of these companies in 1955 were expected to exceed the \$1,000,000,000 spent in 1954.

(L. M. F.)

Philadelphia. The estimated population of Philadelphia, Pa., was 2,130,600 in 1955, an increase of nearly 68,000 over the 1950 national census count of 2,071,605. Public and parochial schools had in 1955 a combined enrolment of 353,060. Philadelphia is the third largest city in the country and the largest in Pennsylvania. It covers 127.2 sq.mi. of land and includes 7.8 sq.mi. of water.

Commercial and industrial activity continued high during 1955. Employment in Philadelphia, and in a seven-county region of which the city is the hub, showed a slight increase. Available estimates placed employment in manufacturing industries of this greater area at 580,000. Nonmanufacturing employment stood at 837,000, a rise of 15,000. Of these labour forces, an estimated 57% consisted of Philadelphia residents.

Philadelphia, whose fresh water port located on the Delaware river is the largest of its kind in the world, exceeded New York in foreign import tonnage during 1954. Total export and import traffic amounted to 78,997,127 short tons, an increase of 5,500,000 tons over the previous year. Of this amount, more than 46,000,000 tons were moved in domestic coastwise traffic. Foreign water-borne tonnage included 2,600,000 tons of exports valued at \$376,000,000 and 30,300,000 tons of imports valued at \$722,000,000. The city government department of commerce estimated unofficially that foreign water-borne commerce would reach at least 38,000,000 short tons in 1955. Exclusively a cargo port for many years, Philadelphia inaugurated its first regularly scheduled passenger run to Bermuda on Aug. 26.

Retail sales in the city reached \$2,668,000,000 in 1954 and bank clearings totalled \$57,147,000,000.

The city's assessed real estate value for 1955 was \$3,662,618,350, with personal property assessed at \$1,516,094,238. Philadelphia's realty tax was \$3.025 per \$100. The city's funded indebtedness consisted on Sept. 1, 1955, of \$537,555,800 of issued bonds, of which \$201,796,566 were self-supporting and not a charge against the city's borrowing limit. Operating budget appropriations for 1955 were \$192,051,609; appropriations in 1954 were \$196,214,643.

Of nearly \$54,000,000 in public works contracts let by the city during the first nine months of 1955, water mains and sewers accounted for \$10,990,000; building improvements and repairs for \$13,500,000; street paving and repair for \$7,049,000; subways for \$1,484,000; and recreational facilities for \$1,893,000.

The city pushed its International Airport expansion program in 1955, commencing work on taxiway lighting and a \$1,500,000 maintenance terminal. It opened an \$800,000 air freight termi-

SPECTATORS FLEEING refinery explosion at Whiting, Ind., Aug. 27, 1955

nal. In the city planning field, a preliminary physical development plan was prepared for the huge northeast and an industrial pilot project of 125 ac. was started to attract new industry. Formal dedication of the partially completed Independence Mall, located north of Independence hall, took place July 4. The city organized a special city-wide co-ordinating committee to combat juvenile delinquency; set up a zoning advisory commission to revise city zoning ordinances; approved final plans for a \$10,000,000 expansion of the gas manufacturing works and distribution system; opened a \$4,000,000 water treatment plant and a new prison shops building; and began work on construction of five modern cottages and a community building at its home for the aged. Survey work started for an expressway along the Delaware river. Development of Penn Center, a large cleared area west of the city hall, proceeded, with the erection of a modern office building, start on foundations for another building and partial completion of Pennsylvania boulevard. The Walt Whitman bridge, connecting South Philadelphia and South New Jersey at Gloucester, reached midpoint in its four-year construction schedule.

The administration of the city in 1955 was Democratic; the mayor was Joseph S. Clark, Jr. (J. S. Ck.)

Philanthropy: see DONATIONS AND BEQUESTS.

Philately. On July 28, 1955, Pres. Dwight D. Eisenhower, Vice-Pres. Richard M. Nixon, Secretary of State John F. Dulles, Postmaster General Arthur Summerfield, Secretary of Defense Charles E. Wilson and many other government officials, together with diplomatic representatives of 73 foreign governments and a select philatelic group, gathered on the White House lawn to launch the issuance of a three-cent "atoms for peace" stamp. This was the philatelic highlight of 1955.

Sixteen stamps were released during the year. As in 1954 six of these were a part of the "liberty" postage issue, bringing the set two-thirds of the way to completion. For some reason postal officials waited until Aug. 25 to resume issuing the new postage set and then released the six stamps in less than three months. The 50-cent Susan B. Anthony was placed on sale at Louisville, Ky., on Aug. 25, in conjunction with the annual convention of the Society of Philatelic Americans.

On Sept. 21 the 30-cent Robert E. Lee value went on sale at Richmond, Va., coincident with the opening of the convention of the American Philatelic society. Three days later (Sept. 24) the 40-cent John Marshall stamp went on sale at Richmond. Then followed the \$1 Patrick Henry value, which was placed on sale at Joplin, Mo., in conjunction with the 4-State Federation of Stamp Clubs' exhibition. On Oct. 20 a one-half-cent stamp portraying Benjamin Franklin was issued in Washington, D.C., when the golden jubilee exhibition of the Washington Philatelic society was opened. The last regular postage value of the year was the six-cent Theodore Roosevelt stamp, released Nov. 18 in New York.

The first seven months of 1955 witnessed the release of all but one of the commemoratives or special stamps, and that was what might be referred to as an added starter. Nine commemoratives were released during the year. The first was the three-cent (brown) adhesive marking the 150th anniversary of the Pennsylvania Academy of the Fine Arts, with first-day ceremonies in Philadelphia, Pa.

On Feb. 12 the centennial of the land-grant colleges (three-cent green) appeared at Lansing, Mich., followed on Feb. 23 by a stamp marking the 50th anniversary of the International Rotary movement (eight-cent blue).

The armed forces reserve was next to be honoured by a stamp, released in Washington, D.C., on May 21 (three-cent blue).

EARLY KINGS OF PORTUGAL honoured in a 1955 Portuguese commemorative issue of stamps

Then followed the release of an entirely new type of stamp, for use on certified mail, or modified registry, which was also issued in Washington on June 6 (15-cent red). On June 21, Franconia, N.H., was the site of issue of a three-cent green stamp picturing the Old Man of the Mountain.

On June 28 the centenary of the Soo locks at Sault Ste. Marie, Mich., was marked by a three-cent commemorative (blue), followed by the "atoms for peace" stamp on July 28 and the Fort Ticonderoga bicentennial adhesive (three-cent sepia) at Fort Ticonderoga, N.Y., on Sept. 18. The final commemorative of the year was not announced until Nov. 7, marking the centennial of the birth of Andrew W. Mellon, financier, secretary of the treasury and principal donor of the National Gallery of Art in Washington, D.C. This stamp was placed on sale in Washington Dec. 20 (three-cent maroon).

Two special groups of stamps made their appearance during 1955. One, observed by many countries, marked the golden jubilee of Rotary International. The second, also observed on a world-wide scale, commemorated the tenth anniversary of the United Nations.

What is conceded to be the greatest private collection ever formed came onto the market in 1955 following the death of Alfred H. Caspary, New York financier. Caspary's collection, valued at more than \$2,000,000, was placed with H. R. Harmer, Inc., New York city, for dispersal by auction in a series of 16 sales. The first, held Nov. 15 and embracing the United States postmasters' provisionals, realized \$225,340.

The Smithsonian institution in Washington, D.C., repository of the national postage stamp collection, received congressional authorization and presidential approval to construct a new \$36,000,000 museum. As one result, the national stamp collection practically doubled its holdings through governmental transfers, private gifts and bequests. (See also POST OFFICE.)

(F. R. B.)

Philippines, Republic of the. A republic situated in the western Pacific Ocean east of Indochina and consisting of an archipelago of 7,100 islands, totalling 115,707 sq.mi. The 1948 census tabulated 19,234,182 persons, and a census estimate for July 1, 1955, totalled 21,848,000. The chief city is Manila, whose metropolitan area contains about 1,400,000. Other cities are Cebu 90,000, Iloilo 125,000 and Bacolod 115,000. Statistics list Davao at 126,000, Basilan at 125,000 and Zamboanga at 117,000 for 1955, but all three cities politically include large rural areas and populations. The official capital is Quezon City, whose 22,000 persons are included in the figure for metropolitan Manila, but most government offices remain in Manila. Nearly 1,000 Americans and 8,000 other occidentals are resident in the Philippines. By official count the Chinese population numbered 142,000.

Most Filipinos are Roman Catholic or native Aglipayan Catholic in religion, the total estimated at 19,500,000. In the southern islands live an estimated 850,000 Mohammedans, whereas about 475,000 Protestants and 700,000 pagans are widely scattered.

President in 1955: Ramón Magsaysay.

History.—Issues that dominated the domestic scene during 1954 and 1955 were the combativeness of congress toward President Magsaysay, the opposition to the president from his own Nacionalista party, the difficulty of securing capable leadership in government offices, the continued failures of judicial machinery to render justice to the masses of the people, and the inability of the government to collect the whole of assessed taxes.

This was counterbalanced by the president's tremendous popularity among the mass of Filipinos.

The president's program was based upon issues of internal security, upholding the constitution, securing efficiency in government, reorganizing the government financial structure, basic land reform and maintaining his foreign policy of friendship to the United States and participation in programs of the free nations of the world. A special session of congress in July finally passed a bill which gave the president power to break up large landed estates and carry out basic land reform. A Nacionalista party convention in August completely endorsed the president's entire program and prepared to name a slate of candidates for office for the November elections which eliminated the president's strongest opponents.

Thus President Magsaysay won from both congress and his own political party both legislation and backing for his basic reform programs.

During the year the Philippines and Japan agreed to terms of reparations for World War II damage caused by the Japanese to the Philippines. Though Filipinos had set the total damage at about \$8,000,000,000, they realistically compromised on a settlement of \$800,000,000 spread over a 20-yr. term. Small cash payments, services in removing sunken ships from Philippine harbours, the provision of \$500,000,000 in capital goods and the provision of \$250,000,000 in investment funds and loans formed the main features of the settlement.

Education.—The national budget for the year 1955-56 authorized an expenditure of \$91,672,000 upon all forms of public education. Including private schools, for which no expense figures were obtainable, there were, Nov. 1954, 26,579 elementary schools having 3,441,864 pupils and 8,925 teachers, 1,607 secondary schools having 605,000 pupils and 21,730 teachers, 381 collegiate institutions with an enrolment of 178,161 students taught by 6,248 professors. Total enrolment was 4,225,025.

Finance.—The peso is the basic monetary unit, divided into 100 centavos, with exchange selling and buying rates very close to the par value of 2 pesos to the U.S. dollar. In July 1955 the internal purchasing power of the peso stood at 0.3205, against a 1941 base of 1, with the cost of living standing at 312, against a 1941 base of 100. On June 30, 1955, there were 54 banks in operation, and total bank resources stood at \$682,450,000, with bank deposits totalling \$515,350,000. Currency in circulation in June 1955 totalled \$329,650,000. Foreign exchange reserves

had dropped to \$248,030,000. The national debt amounted to \$629,050,000. The national expense budget was set for the fiscal year 1955-56 at \$388,000,000, with government revenue estimated at \$326,060,000, requiring further deficit financing. National income for calendar 1954 was estimated at \$3,719,000,000, the highest figure yet attained.

Communications and Trade.—Railroad mileage operative in 1954 was 740. freight carried was approximately 1,500,000 tons and passengers carried numbered 8,504,000. Highways totalled 18,550 mi. at the end of 1954, with 116,000 licensed motor vehicles. Domestic air lines flew 9,150,000 mi., carrying 252,000 passengers and 12,780,000 lb. of freight. There were 47,000 telephones at the end of 1954, and about 13,000 mi. of telegraph lines. Forty-five broadcasting stations were listened to through an estimated 400,000 radio receiving sets.

The total export trade of the islands in the calendar year 1954 totalled \$412,100,000. The ranking items comprised copra \$128,800,000, sugar \$107,000,000, logs, lumber and timber \$34,400,000, abaca \$26,000,000, base metals \$40,000,000, coconut oil \$16,800,000, desiccated coconut \$13,600,000, embroideries \$11,600,000, precious metal concentrates \$11,000,000 and canned pineapple \$4,650,000. The import trade totalled \$452,600,000, resulting in another unfavourable trade balance. The ranking items were cotton and manufactures \$63,800,000, petroleum products \$42,400,000, iron and steel manufactures \$36,500,000, automobiles, parts and tires \$31,100,000, general machinery \$30,380,000, grains and products \$27,100,000, dairy products \$23,000,000, paper and products \$19,160,000, chemicals and drugs \$19,100,000, rayon and other synthetic textiles \$19,090,000. During the year the United States took 60.7% of the exports and supplied 67% of Philippine imports. Japan took 12.1% of the exports and supplied 6.1% of the imports. During October a trade agreement calling for the exchange of about \$20,000,000 worth of goods was negotiated with western Germany.

Agriculture.—Land cropped during 1955 was estimated at 16,652,000 ac. Rice harvested totalled 7,310,000 ac., maize about 3,440,000 ac., coconut 2,445,000 ac. and abaca 590,000 ac. Fruits totalled 830,000 ac. and root crops 700,000 ac. The index of agricultural production for the year 1954 had reached 117 against a 1952 base of 100, and the expectation for 1955 was a still higher figure. Livestock figures on Jan. 1, 1955, indicated water buffalo at 2,836,000, cattle 846,000, goats 422,000, horses 230,000, sheep 22,000, pigs 6,423,000 and chickens 42,100,000.

Manufacturing.—The manufacturing index lifted to 127 against a 1952 base of 100. For 1954 statistics indicated total "factories" as 11,464, but only 3,239 made reports to government agencies. This latter number of concerns reported 2,439,000 industrial labourers. Of reporting firms, 779 processed food products, 588 processed wood products and furniture, 552 worked with textiles and clothing products, 258 manufactured chemicals or drugs, 301 operated in the metals and machinery industries, 99 produced paper products and 88 produced tobacco products. The total value of manufactured products rose above \$400,000,000 for the year.

Mining.—The index of mining production stood at 147.7 against a 1949 base of 100. Figures for 1954 showed production of gold at 416,000 oz., silver 527,000 oz., copper 14,350 metric tons, manganese 9,400 metric tons, chromite 451,000 metric tons and coal 120,000 metric tons. Iron ore production during the first half of 1955 totalled 725,000 tons.

(J. E. Sp.)

ANNIVERSARY CEREMONIES in the Philippines July 4, 1955, marking the ninth year of independence

Philosophy.

For the past quarter century philosophy has been engaged in a large internal controversy over its own proper nature and function. Under the impact of scientific thought, the traditional enterprise of philosophy as primarily a quest for reality and the good life had been challenged. A serious attempt had been made to establish in its place philosophy conceived as analysis: logical, methodological and linguistic. For a time the major schools of metaphysics and value theory, such as idealism and realism, were severely discredited. The analytical philosophy described its role as primarily the clarification of meaning. It was associated, moreover, with a rigorous positivism that restricted knowledge to science, describing statements that are nonscientific in principle as meaningless and treating value judgments as emotive rather than cognitive.

But by 1955 it had become evident that the logician-scientist-philosopher, though well entrenched and here to stay, had not dislodged and was not likely to displace the traditional philosopher who seeks humane wisdom through broad interpretations of reality and a search for the meaning of existence. There were signs of a genuine resurgence of metaphysics, and the traditional schools of thought, though often altered importantly by the influence of analysis and positivism, were making a strong stand. There was indication, however, that today's philosophers were more concerned with specific problems, whether theoretical or practical, than with the construction of large speculative systems, and that speculation itself had been effectively tempered by the demand that philosophy must constantly accept the criticism of the sciences. Moreover, there were signs of increased communication and co-operation among philosophers, as among scientists, and less inclination to favour isolated and totally independent efforts in the treatment of philosophical questions. Increased co-operation was made possible in part through projects financed by private foundations.

Philosophy in 1955, a decade after the close of World War II, was clearly affected by the war and by the large political, social and cultural events that followed it. The interest in the analysis of culture, shared with the cultural anthropologists, continued, as did the concern for the philosophy of history and the attempt to understand and interpret contemporary history. Much attention was given to problems relating to the meaning of human existence, the vocation of man and the ground of human values. In all these matters the attitudes characteristic of recent thought generally obtained. There was little optimism regarding either the future of society generally or the character of the human individual, yet pessimism, nihilism and negativism in the estimate of humanity seemed to be steadily receding in favour of a cautious hopefulness. There was an increased emphasis on value problems, and the strong subjectivism and relativism of the prewar period, that denied an objective status to moral and other values and insisted that they have no absolute nature or foundation, were subjected to vigorous criticism. There was a serious effort to ground morality, both public and private, on a basis that was stable and lasting and yet provided for the great variety of human aptitudes and changing circumstance.

The most important recent event in moral philosophy was the fifth series of the Woodbridge lectures delivered late in 1954 at Columbia university by Clarence I. Lewis, professor emeritus at Harvard university, on "The Ground and Nature of the Right." *The Human Career*, a work in the philosophy of education by Robert Ulich, was an important effort to indicate on naturalistic grounds the possibilities of human growth and achievement. In the philosophy of history much attention was given to the final four volumes which completed Arnold Toynbee's ten-volume monumental work, *A Study of History*. The

Dutch historian Pieter Geyl published a collection of essays entitled *Debates With Historians*, analyzing several major historians including Ranke, Michelet and Toynbee.

Although there was no decline in interest in the philosophy of science or in social philosophy, there was in 1955 a clear indication that concern for the philosophical issues of religion continued to grow. Religious subjects comprised a larger segment of the curriculum of higher education, and advanced writings on religion enjoyed a larger reading public. There was an increase in the publication of classical writings in religion and religious philosophy, as well as a steady output of new analyses and interpretations of religion.

Whereas the traditional approach to fundamental philosophical problems in religion was oriented especially to the question of the existence and nature of God, contemporary writers more frequently centred their attention on the fact of human existence and the problem of its meaningfulness. Existentialism, the philosophy that takes its stand totally on this fact, which treats reality primarily through subjective analyses of existence and has a profound concern for the human condition, was clearly established by 1955 as the main contemporary influence on religious thought. In this connection the major forerunners of existentialism, Kierkegaard and Nietzsche, were still exerting a decisive influence, while the impact of Freudianism, with its psychological analyses of the nonrational factor in human behaviour, seemed to be increasing.

Among the interesting philosophical events of the year was the celebration on July 31 of the Josiah Royce centenary at the University of California at Los Angeles in honour of America's foremost idealist and metaphysician. A mark of the vitality of philosophical idealism, which had for several decades been eclipsed by pragmatism, realism and positivism, was the creation of the Foundation for Idealistic Philosophy.

If idealism showed signs of new stirrings, realism, its long time rival, was thriving, especially the realism of neoscholasticism, the philosophical position that enjoys strong support from Catholic philosophers. The neoscholastic realists vigorously opposed the various forms of both positivism and subjectivism that threatened belief in the objective status of reality and values. Yet they worked ingeniously to incorporate into their philosophy the gains made by both the positivists and existentialists. It was evident that neoscholasticism is a philosophy with a broad appeal that extends to non-Catholics as well as Catholics and that its attractiveness is not identified simply with its capacity as an intellectual groundwork for religion.

An unusually large number of philosophical writings were published during 1955, reflecting interest in a larger variety of problems in every area of the philosophic enterprise. Moreover, the publication of old philosophical classics and near classics as well as the reprinting of comparatively recent works indicated a rapidly growing philosophical reading public. A leading publication in the field of philosophical analysis was the *Philosophy of Analysis*, the 1952 Hertz lecture of the British Academy delivered by the American philosopher Brand Blanshard. The analytical genius of the 17th-century mathematician Leibniz was examined in R. M. Yost's work *Leibniz and Philosophical Analysis*. Leibniz' metaphysical analyses were an important element in a two-volume publication of his work under the title *Leibniz: Philosophical Papers and Letters*, translated by L. E. Loemker. Both aestheticians and art critics were served an interesting critique of aesthetic theories by a group of analytical philosophers from Cambridge, Oxford and elsewhere under the title *Aesthetics and Language*.

In the philosophy of science, considerable attention was directed to the questions of explanation, causality and induction and to the usual problems of meaning and method. The mathe

matician G. Pólya's two-volume *Mathematics and Plausible Reasoning* brought mathematical analogy to the treatment of inductive inference and illustrated the role of guesses and hunches in mathematics. The American philosopher A. C. Ben-jamin, in a work entitled *Operationism*, presented a thorough examination of the concepts of operational meaning and opera-tional method that had resulted in part from the impact of rela-tivity physics on the philosophy of science. P. W. Bridgman, the Harvard physicist largely responsible for today's formulation of operationism, published *The Nature of Some of Our Physical Concepts*, lectures delivered in 1950 at the University of London on the distinction between "instrumental" and "paper and pen" operations in physics. A major contribution to scientific philoso-phy was *Foundations of Biology* by Felix Mainx, a monograph of the "International Encyclopedia of Unified Science," spon-sored by philosophers and scientists interested in a unification of all departments of knowledge.

Antique scholarship was aided by a new journal, *Phronesis*, founded in the Netherlands for the pursuit of ancient philosophy.

Phosphates: see MINERAL AND METAL PRODUCTION AND PRICES.

Photography. While 1954 was a good steady year of pro-duction, with more than \$700,000,000 worth of photographic products manufactured in the United States alone, the year 1955 showed a 10% to 15% advance in photo-graphic sales for the first eight months. Sales and earnings of the Eastman Kodak company for the first six months of 1955 increased 13.6% over the same 1954 period and 11% over the first half of 1953. Sales of Bell & Howell company for 1954 reached a high of \$40,699,495, representing a 36.5% increase over its 1953 sales of \$29,816,408.

Exports from the United States of motion-picture films and equipment during the first quarter of 1955 totalled \$11,372,066, a 36% gain over the same 1954 period. Exports of all other photographic goods during the first quarter of 1955 amounted

to \$10,038,877, an increase of 23% over the same 1954 period. Exports of still- and motion-picture products during 1954 amounted to \$75,346,886.

Germany produced 3,024,861 still cameras during 1954, repre-senting an increase of 23.9% over 1953. Continued increases in German camera production were indicated for 1955. There were 310,411 still camera units exported to the United States in 1954.

Cameras and Equipment.—The British Photo fair was held in May 1955 at the New Horticultural hall, Westminster. More than 50 exhibitors displayed their photographic products. This exhibition was the first important British photo fair in 20 years. The great Photokina fair is held every two years, and the next one was to be at Cologne, Ger., in 1956 from Sept. 29 through Oct. 7.

With so many technical advances in the 35-mm. miniature camera field the past few years, there had been an increased use of these cameras all over the world. The new 35-mm. high-speed films and the new colour films added a heightened inter-est. The Kodak works in Germany manufactured the new 35-mm. Retina IIIC camera with such important new features as interchangeable lens components to give 35-mm., 50-mm. and 80-mm. focal lengths, a new synchro-compur shutter, built-in exposure meter, new light-value system, view finder and range finder combined in one window, and a new focusing mount replacing the former bellows. Kodak also brought out an im-proved Model C Pony with a 44-mm. Kodak Anaston f/3.5 lens and flash 300 shutter in the low-price range.

Graflex, Inc., introduced the Graphic 35 early in 1955. This new miniature camera created special interest because of the new push-button focusing, a focusing method based on the split-image principle, but activated by two buttons on each side of the lens and shutter assembly. The photographer merely squeezes these buttons to automatically rotate the lens mount in or out. Other features of this camera were Spectramatic flash settings, a system for simplified flash photography, Visi-Ready footage

GALLERY VIEW of "The Family of Man," photographic exhibit assembled by Edward Steichen for the Museum of Modern Art, New York city. The work of photographers of 68 nations was represented in the collection of more than 500 pictures placed on display early in 1955

scale for instant depth of field readings and all-metal body construction. Shutter speeds ranged from 1/300 sec. to 1 sec., plus bulb. There was also a built-in synchronizer for all flash lamps including electronic flash.

Anso made the Anscoflex II, with built-in yellow filter and a close-up attachment, for the low-price field. Bolsey Corporation of America produced the improved Bolsey Jubilee 35-mm. camera with Set-O-Matic shutter adjustment for simpler picture taking.

Graflex, Inc., made a modified version of the Pacemaker Graphic early in 1955. This latest press camera modification included the adaptation of a new Graphic range finder that permits use of various lenses coupled to the range finder with interchangeable cams. The optical view finder automatically corrects for parallax as the camera is focused. A built-in Rangefinder projects two beams of light which when superimposed on the subject by activating the focusing knob indicates the camera is in focus.

Stereo Photography.—Interest in stereo photography continued through the year with a few new stereo still cameras appearing in Germany and the United States. Realist, Inc., introduced the Realist "45" stereo camera, which was fitted with a pair of Steinheil Cassar lenses and manufactured in west Germany. Graflex, Inc., showed a new Stereo-Graphic camera at the convention of photographic dealers in Atlantic City, N.J., during April 1955. This 35-mm. stereo camera had a new method of lens arrangement, called Depthmaster Auto-focus, requiring only one adjustment for picture taking. The lens diaphragm control on the front of the camera is marked bright, hazy and dull, and when the one adjustment is made the camera is ready for picture taking. The shutter is cocked automatically each time the film is advanced. A number of manufacturers produced split-frame stereo attachments for making a stereo pair of pictures on a single 24x36-mm. frame. The Ernst Leitz works in Wetzlar, Ger., produced the Leica Stemar Stereo system, a twin-lens attachment with matched 33-mm. Elmar f/3.5 lenses that give good stereo pictures up to about 15 ft. A distant prism attachment is slipped over the twin lenses for taking stereo pictures beyond 15 ft.

A new table viewer for stereo slides was announced by the Bell & Howell company. The new viewer projects a stereo still picture on an 8x10-in. screen similar to that of a television set. The projector and screen are combined into one lightweight, blower-cooled, 15½-lb. unit.

Emulsions.—The new Cronar polyester photographic film base sensitized with Photolith emulsion was being introduced by du Pont to the graphic arts industry for lithography and photo-engraving, and to the motion-picture industry for both negative and printing films. Although thinner than regular film base (.0042 in. compared with .0058 in.), litho-sensitized Cronar polyester photographic film base has an average tear strength (load in grams) of 225, compared with 40 for coated cellulose tri-acetate. In tests of folding endurance, Cronar-supported Photolith withstood 20,000 flexings, while tri-acetate base broke after only 15 flexings under the same 50% relative humidity. It also had considerably better dimensional stability than most other films.

A number of 70-mm. du Pont motion-picture films were available, such as: Superior 2 panchromatic, Superior 3 panchromatic, and High Speed Rapid Reversal Pan for the U.S. air force's conversion of its 16-mm. gun-cameras to the larger size. A new rough-textured warm tone surface, Artweave ZL, was added to the line of du Pont projection papers. Varilour variable contrast photographic paper was also introduced for use with du Pont's filters for providing a contrast range from grade No. 0 to No. 3.

GRAND PRIZE WINNING PHOTOGRAPH in the 1955 National High School Photographic awards competition. The photograph was taken by Robert Ludlum, age 17, of Santa Barbara, Calif.

Polaroid corporation introduced three new emulsions for use in their cameras and "picture in a minute" system of photography. They were: Polaroid Polapan 200 Type 42, 400 Type 44 and Professional Pan Type 43. These films had a greater tone range than the orthochromatic type 41 Polaroid film, along with increased range in speed and exposure latitude. The 200 and 400 films had the equivalent American Standards association speed ratings.

Monodex Super White photofinishing paper made by Ansco was introduced for use in continuous processing systems. This paper featured a super white finish by use of chemical brightening agents. The same firm made the Ardura warm tone portrait enlarging paper similar to their Indiatone but with four times the speed.

The Kodak Tri-X ultra-high-speed panchromatic film was made available in roll type and became increasingly popular with amateur and professional photographers, and for special 35-mm. motion-picture photography. Although the film was rated at 200 ASA for daylight and 160 ASA for artificial light, many picture takers obtained acceptable results at speeds up to 600 ASA or more. The Tri-X super-fast film was also available for 16-mm. motion-picture cameras. The trend throughout the industry in Europe and the United States was toward faster emulsions, at the same time retaining many of the features of the slower films such as grain size and latitude.

Adox thin-emulsion film was exported to the United States in 35-mm. and 120 sizes by C. Schleussner of Frankfurt, Ger., and proved to be of special interest because of the extremely fine grain emulsion. The thin emulsion layers were about two-thirds as thick as normal photographic emulsions, and gave extremely fine grain, long-scale gradation, high image resolution. This film was of special value for miniature camera users for making negatives that would give sharper prints when enlarged.

Colour Photography.—Kodak's fast 35-mm. Ektachrome film appeared in the early part of 1955, with a speed about three times faster than the regular Ektachrome sheet and roll film. The daylight type had an exposure index of 32 ASA. Processing Ektachrome kits were made available for the photographer. Anscochrome High Speed Color Transparency film was introduced about the same time. This was the first high-speed colour film for all popular cameras, with a film speed increase of three times. Later in the year Ansco produced the 16-mm. Anscochrome with a high-speed emulsion for use in 16-mm. motion picture cameras. This was followed by the Anscochrome Shee Film in a variety of sizes.

Kodak processing materials were available for the new Ektachrome and also for Kodachrome colour films. By the end of 1955 these films were in a new type package without a processing charge included in the price of the film.

Kodak introduced two new papers for making colour prints from colour negatives and transparencies. One was Kodak Color Print Material Type C for making prints from colour negatives such as Ektacolor and Kodacolor; the other was Kodak Color Print Material Type R for making colour prints from transparency positives such as Kodachrome, Anscochrome and Ektachrome.

Flash Photography.—Aug. 1, 1955, marked the 25th anniversary of the introduction of the photoflash bulb in the United States, by the General Electric company. Production of photoflash lamps had increased from 303,000 in 1930 to about 515,700,000 in 1955, when approximately 15,000,000 cameras owned in the United States were equipped for flash picture taking. It was estimated that about 25% of all pictures taken were with flash.

Electronic flash photography made important advances during the year, with new models appearing in Europe and the United States. The continued use of dry battery power showed a definite trend away from the original wet batteries that require recharging. Also, the power packs of these units were getting lighter. The new Amglo Champion electronic flash, made by the Amglo corporation, had a model weighing only 28 oz., and good for 500 flashes before the battery required replacement. This unit could be carried in a pocket or hooked on a belt with a connecting cord to the electronic flash lamp on the camera. The Limelite corporation in Los Angeles, Calif., produced their Lime-lite "60" portable electronic flash which used two 240-volt dry-cell batteries in the power pack unit. Heiland's Strobosar Six electronic flash contained a high-low selector switch to adjust the flash output. It gave a choice of full power or one-fourth power, to make a difference of two f-stops in exposure.

Graflex, Inc., obtained controlling interest in the Strobo Research company and started manufacturing the original Stroboflash units for all cameras and especially for the popular Speed Graphic press cameras.

The Multiblitz electronic flash was produced in West Germany in a variety of portable and studio models with AC or wet-cell battery power units. The Braun Hobby "100" electronic dry battery flash, manufactured in Germany, was being imported to the United States by E. Leitz, Inc., for use with their Leica cameras.

Philips of Eindhoven, Neth., brought out a new all-gas filled hidget capless flash bulb called the Philips Photoflux PFr. There was no metal base on this lamp and the lead-in wires extended outside the sealed glass base of the bulb, which fit into a reusable metal adapter base with built-in ejector mechanism.

Motion-Picture Photography.—A new 16-mm. Cine-Kodak E-100 was announced with a full-size telescopic view finder, a speed range of 16 to 64 frames per second, and a special pressed spring power motor which exposes up to 40 ft. of film with one winding. Kodak also made six new models of the Kodascope Pageant sound projector for the audio-visual trade. The main feature of these projectors was the new Super-40 shutter which shifts automatically between two- and three-bladed positions to provide increased screen illumination while retaining freedom from flicker during showing of either sound or silent pictures.

Keystone Camera company made a 16-mm. movie camera known as the Keystone Newport. DeJur-Amsco corporation developed their 8-mm. Voyager, intended for the lower-price field. This firm also made the Spectator 8-mm. turret movie camera which uses three lenses on the turret mount and takes 25 ft. of

double-eight roll film. The Bolex division of Paillard Products, Inc., introduced the 8-mm. M-8 projector with such important features as: a film guard that automatically reforms any "lost loops" during projection, fast $f/1.6$ and $f/1.5$ lenses and the ability to rewind 400 ft. in 15 sec. The Kalart company made a new 8-mm. viewer and editor for movie fans known as the Kalart Editor-Viewer-Eight. It is a practical 8-mm. table-top movie viewer, and a complete outfit for film editing and repair.

The Bell & Howell company made a number of new motion-picture lenses such as: (1) the Bell & Howell-Angénieux three-inch $f/2.5$ telephoto lens for 16-mm. motion-picture cameras; (2) a 10-mm. $f/1.8$ short focal length lens manufactured by Pierre Angénieux of St. Héand, Fr., to Bell & Howell specifications; (3) a Bell & Howell-Angénieux one-inch $f/0.95$ lens which combines ultra speed with sharp definition and full colour correction; (4) an aerial reconnaissance 6-in. $f/2.5$ lens for taking detailed aerial photos of military and other strategic installations at altitudes ranging from 1,000 to 3,000 ft.

Zoomar, Inc., made a new Zoomar lens for 35-mm. motion-picture studio work, the Zoomar 35-mm., with a maximum speed of $f/2.8$ and a zoom range from 40 mm. to 120 mm. They also produced a new Zoomar 16-S and Zoomar 8 lens for 16-mm. and 8-mm. motion-picture photography. There was also a Zoomar 10-in. and 20-in. telephoto lens added to the line.

Family of Man.—Outstanding in the photographic world for 1955 was the exhibition of more than 500 photographs by 257 photographers at the Museum of Modern Art in New York city. Under the direction of Edward Steichen, the photographs were selected from 68 countries and arranged as a theme exhibition known as "The Family of Man." The photographs presented the story of man from birth to death, in special sections with quotations from world literature, to build up the continuity of life. About 240,000 copies of *The Family of Man* book were printed to meet the demand for a permanent record of this exhibition. (See also ELECTRONICS; MOTION PICTURES; NEWSPAPERS AND MAGAZINES.) (W. D. MN.)

Physics. **The Artificial Satellite.**—The most widely discussed physics event of 1955 was probably the July announcement in the United States by the National Academy of Sciences and the National Science foundation of plans for an artificial satellite. It was expected that by 1957 or 1958 a small body would be sent into space and would rotate about the earth, thus in a very small way imitating the earth's natural satellite, the moon. The body was expected to be a sphere about 18 in. in diameter, and multistage rockets would originally carry it to a height of about 250 mi. It would then circle the earth about once every 90 minutes, moving with a velocity of about 18,000 m.p.h. It would probably be visible from the earth with the aid of low-power field glasses. The satellite orbit would gradually move in closer to the earth, and eventually the satellite would be disintegrated as a result of frictional heating in the upper atmosphere.

The government of the U.S.S.R. also announced that it was planning to build and launch a satellite. Scientists generally expected that the proposed satellites would be of great value in making sustained observations of solar radiations and cosmic rays at levels that are beyond almost all of the earth's atmosphere, as well as in observing the composition, density and temperature of the atmosphere itself at high levels.

Einstein and Fermi; Elements 99, 100 and 101.—In August the groups at the University of California, Berkeley, the Argonne National laboratory, Lemont, Ill., and the Los Alamos (N.M.) Scientific laboratory who in the previous year had announced the discovery of elements 99 and 100, gave names in honour of Einstein and Fermi to these elements. Albert Einstein died in April 1955; Enrico Fermi died in Nov. 1954. For 99 the

RE-ENACTMENT of Otto von Guericke's famous experiment proving atmospheric pressure which took place at Libertyville, Ill., in 1955 when teams of horses, directed by costumed handlers, attempted to pull apart two metal hemispheres from which the air had been removed. The re-enactment was a scene in the film *Atmospheric Pressure* produced by Encyclopædia Britannica Films Inc.

name einsteinium (chemical symbol E) was suggested, and for element 100 the name fermium (symbol Fm).

In June a group at the University of California, led by G. T. Seaborg, announced the production and identification of element 101. A few atoms of the element were produced by bombarding the mass 253 isotope of element 99 with alpha particles from a cyclotron. The alpha particles, which carry 4 units of mass and 2 charge units, were believed probably to have combined with the E^{253} to form atoms of element 101, of mass 256, with emission of 1 mass unit as a neutron. In any event, there was definite evidence that atoms of some isotope of element 101 were formed. The half life of the 101 atoms seemed to be of the order of 30 minutes. The new element was given the name mendelevium (symbol Mv), in honour of the 19th-century Russian chemist Dmitri Mendeleyev, whose principle of using the periodic table in predicting properties of undiscovered elements had been, in the words of the discoverers of 101, "the key to the discovery of the last seven transuranium elements."

Mesons and Hyperons; Antiproton.—The work of many physicists continued to be directed toward the problems of the various elementary particles which are found in nature. The number of different kinds of such particles is now fairly considerable; in addition to the electron, proton and neutron of stable matter, and the photon, positron and neutrino, there are the charged pi and mu mesons, which have masses of 273 and 206 m , respectively, where m is the electron mass, and the neutral pi meson, of mass 264 m . A group of particles known as "heavy mesons," or K particles, distinguished as tau, theta, kappa or chi heavy mesons, had been described within the past few years; these mesons have masses of the order of 1,000 m . A further group of at least three different kinds of mesonlike particles had during the past year or two come to be known as hyperons; these particles have masses greater than 2,000 m —in one case as great as 2,600 m —and are given the name hyperon because their masses are greater than the proton mass, 1,836 m . (The name meson originally signified a mass between the electron and proton masses.) All the mesons and hyperons are highly unstable, decaying eventually into some combination of proton, neutron, electron, positron, photon or neutrino.

Mesons and hyperons had first been observed in studies of highly energetic cosmic-ray particles, but in the past few years pi and mu mesons had been produced in the laboratory, by means of atomic collisions involving the high-energy ions produced in particle accelerators. With the use of higher-energy particles from the accelerators heavier particles could also be produced, and by the end of the year particles from the cosmo-

tron accelerator at the Brookhaven National laboratory, Upton, N.Y., or from the bevatron at the University of California Radiation laboratory had been used in collisions in which both heavy mesons and hyperons were formed.

Cosmic rays continued to be perhaps the major source of new observations on mesons and hyperons, and the use of "stripped emulsions" was found to be of great value in these studies. In this technique, sheets of photographic plate emulsion are piled together; cosmic-ray particles passing through the stack of emulsion sheets leave tracks, such that on development of the emulsion the paths of the particles and their decay products may be studied. The kinds of particles and their modes of decay may be deduced from the observations.

An elaborate experiment using such stripped emulsions was carried out jointly by groups from the universities of Bristol, Eng., and Milan and Padua, It. In Oct. 1954 a stack of emulsions, of 15-l. volume and containing 250 sheets of emulsion, each 0.06 cm. thick, was exposed in a balloon over northern Italy for six hours, at an altitude of about 80,000 ft. After processing the stack was divided among the Bristol, Padua and Milan groups and among workers at the universities of Brussels and Genoa, at the University college and Institute for Advanced Studies, Dublin, and at the Institute for Theoretical Physics, Copenhagen. The examination of photographic emulsions for cosmic-ray particle tracks is a tedious operation, and this experiment represented a noteworthy example of international co-operation on a laborious scientific task. A report in June on the first four months' examination of the emulsion indicated that about 80,000 particles were recorded, and that the potentialities of the method were as great as had been hoped. Among the first results were new information on the modes of decay of several heavy mesons and on the decay of a hyperon, data on the associated production of hyperons and heavy (K) mesons in a single event, and description of the simultaneous production of a K^+ , K^- pair, similar to the pair production of positrons and electrons. There was also some further evidence for the existence of atomic nuclei in which a neutron is replaced by a neutral hyperon; such nuclei break up upon decay of the highly unstable hyperon.

Further evidence for the existence of the antiproton was announced in October by a group headed by E. O. Lawrence and E. Segre at the University of California. The antiproton would be a particle of the same mass as the proton, but with a negative charge in place of the positive charge of the proton. It would be expected that an antiproton would not long exist in the presence of ordinary matter, but would combine with a proton, with resultant annihilation of the two particles and release of energy corresponding to the combined proton-antiproton mass. Previously, there had been "events" in cosmic-ray studies which seemed to indicate the presence of an antiproton. The Californi-

group stated that they had formed antiprotons artificially, in collisions between copper nuclei and ions of several-billion-volt energy produced in the Berkeley bevatron.

The Caesium Clock.—Clocks of very high accuracy, utilizing internal transitions of caesium atoms, were constructed under the direction of J. R. Zacharias and J. G. Yates at the Massachusetts Institute of Technology, Cambridge, and by a group under L. Essen and J. V. L. Parry at the National Physical Laboratory, Teddington, Eng. Much pioneer work in atomic clocks had been done by H. Lyons, of the national bureau of standards, Washington, D.C. A clock of much higher accuracy than the crystal vibrator clocks, the most accurate that are in current general use, is desirable for many reasons. The period of rotation of the earth on its axis, for instance, is believed to vary somewhat from day to day, with variations which are of the order of 1 part in 100,000,000. The new caesium clock had an achieved stability of 1 part in 1,000,000,000, and a stability ten times greater was believed to be fairly readily attainable.

The nucleus of a caesium atom possesses magnetic properties such that it interacts with the magnetic field of the spinning electrons which constitute the non-nuclear part of the atom. The nucleus will take up certain defined positions with respect to the electrons, and varying energies are associated with these positions; transitions between these various energy states may be induced by applying an oscillating external magnetic field. Atoms whose nuclei have undergone an energy transition may be separated from those whose nuclei have not by passing a beam of the atoms through a highly inhomogeneous stable magnetic field, additional to the oscillating field. A detector may be arranged which will measure the quantity of atoms separated from the beam as a result of their having undergone the energy transition in question. This "molecular beam" technique may be utilized for making observations of properties of many kinds of atomic nuclei. Caesium was suitable for a "clock" because it possesses an energy transition which is very sharply defined and because a beam of caesium atoms, emerging from an oven of hot caesium gas, is fairly easily attained. The caesium beam serves as a clock by virtue of the fact that the energy transitions will occur only when the oscillating magnetic field which induces the transitions has the required characteristic frequency (which is of the order of 9,000,000,000 oscillations per second). The oscillating circuit which makes the oscillating magnetic field may therefore be kept very closely at the required frequency by the use of correcting elements which respond to a change in number of atoms arriving at the detector after having undergone the internal energy transition.

The M.I.T. clock was contained in a metal can 6 ft. long and 10 in. in diameter (although with considerable external electronic equipment), and an atomic beam which used only about 0.000001 g. of caesium per day was sufficient. It was expected that comparatively routine manufacture of similar clocks for physical and astronomical laboratories might be started in the near future. The Teddington group pointed out that the caesium clock was a first example of the use of an atomic frequency standard with an accuracy greater than that obtained by using a unit of astronomical time and represented "the highest accuracy ever achieved in the measurement of any physical quantity in terms of a definitive standard." It was suggested that the caesium frequency replace present astronomical observations as the standard for our time unit.

The Hodoscope.—A new kind of instrument for observing the paths of nuclear particles was described by M. Conversi and A. Gozzini, of the University of Pisa, It. An energetic particle, as an electron or a meson, in passing through a gas leaves a trail of electrons and ions; that is, in its collisions with the gas atoms the particle knocks off atomic electrons, leaving the atoms

with net electrical charges. If a strong electrical field is applied to the region of the ion trail, before ions and electrons have had time to recombine into neutral atoms, the electrons will be accelerated by that field, and as a result of the acceleration will give a luminous glow. Conversi and Gozzini utilized this effect in their detector, which they called a hodoscope. The instrument consists of a large number of small neon-filled glass tubes, arranged in layers within a latticework of aluminum plates which can be electrically charged so as to set up the required electrical field. The passage of a particle through the neon tube chamber is recorded by particle counters placed outside the chamber, and these counters set off a circuit by which a strong electric field, of as much as 10,000 v. per centimetre, is applied in the hodoscope chamber. The momentary luminous glow may be photographed, and the lighted neon tubes very nicely show the path of the particle.

Atomic Velocities in a Gas.—The distribution of the velocities of the atoms and molecules in a gas had long been assumed to be as theoretically predicted by James Clerk Maxwell about 100 years ago; in this distribution the particles have an average velocity, which rises with the gas temperature, but individual molecules may have velocities that are much greater or less than the average velocity. There had been abundant indirect evidence to place the "Maxwellian distribution law" among the virtually unquestioned laws of physics, but attempts to measure directly the velocity distribution had not been altogether successful. It was of interest that a satisfactory confirmation was obtained by R. C. Miller and P. Kusch of Columbia University, New York, N.Y. The velocity distribution was obtained for potassium and thallium atoms in atomic beams emerging from a hot oven. Good agreement was obtained between observed distribution in the beam and that predicted by theory on the assumption that the atoms in the oven gas were in a Maxwellian velocity distribution. (See also ATOMIC ENERGY; ELECTRONICS; INTERNATIONAL GEOPHYSICAL YEAR, 1957-58; METEOROLOGY; STANDARDS, NATIONAL BUREAU OF.)

"FINAL TRIP TO THE COSMOS," a 1955 cartoon by Long of the *Minneapolis Tribune* (Minn.)

Physiology. **A New Adrenal Cortical Hormone.**—Until relatively recently attempts to isolate the active hormonal principles of the adrenal gland had resulted in the isolation and identification of 28 steroids, seven of which had biological activity; *i.e.*, were able to maintain life in an animal from which the adrenals had been removed.

After the removal of the known active hormones from glandular extracts, there remained an amorphous fraction that had high biological activity. This, of course, suggested the presence of a yet unidentified adrenal cortical hormone.

The known adrenal hormones possess a variety of biological effects. The specific effects or activities are related to the chemical structure of the compound and can be divided into three main classes. One group is most potent in causing the deposition of glycogen in the liver and in maintaining the work capacity of muscles during continued exercise. Another group acts mainly on the kidney, causing the retention of salt and normalization of the salt content of the blood. The third group seems to be concerned mainly with the synthesis of body proteins and with the development of secondary sex characteristics during growth.

The unknown hormone in the amorphous fraction demonstrated properties that placed it in the second class or salt active group. The activity of this fraction in this respect was much greater than that of any of the known adrenal hormones.

The new hormone, obtained from the amorphous fraction, was first isolated in 1953. Analytical, biological and clinical work progressed rapidly during 1955 in spite of the small amounts available.

The new hormone was named aldosterone. It is about 30 times as active as any known adrenal cortical hormone in maintaining sodium balance and well-being in an animal from which the adrenals have been removed. It is less active than cortisone in causing glycogen deposition. Likewise on the basis of a few trials it has no effect on rheumatoid arthritis. In one respect its action is unique in that it was reported to reduce pigmentation in patients with Addison's disease. It was recently detected in the peripheral blood of normal men and thus is probably a natural hormone. Its activity is great enough to account for all the activity of the amorphous fraction, and it was believed that its discovery would probably complete the list of natural adrenal cortical hormones.

Fats in Nutrition.—Fats and oils in the diet are known to be the richest source of calories; however, the opinion has existed that these materials are optional components of diet and not really necessary for good nutrition.

In addition to the above concept the idea has also developed that fats, in addition to being nonessential, may have a deleterious effect on the health and longevity of those that consume high-fat diets for long periods of time. Such dietary habits have been shown to result in an elevated incidence of high blood pressure and hardening of the arteries and a high incidence of disease of the coronary arteries.

As a result of these observations much attention was paid during the preceding several years to the use of low-fat or fat-free diets in an effort to control the development of diseases of the blood vessels as well as to prevent obesity.

However, considerable investigational work seemed to indicate that fats and oils are not optional components of the diet but that by virtue of their presence in the diet a more satisfactory nutritional state results. In addition, it was shown that the complete absence of fat in the diet in a carefully designed experiment can have adverse effects on a number of physiological functions.

Young rats maintained entirely on a low-fat or fat-free diet grow at a much slower rate than do rats eating a diet containing fat. The experimental data suggested that the optimal rate of

growth results when the diet contains fat to the amount of 30% by weight or 50% on the basis of caloric content.

The attainment of sexual maturity by young rats is definitely delayed when these rats are fed low-fat diets from the time of weaning. Pregnancy and lactation are critical criteria for evaluation of the nutritional value of a diet. In this respect they are more valuable criteria than growth alone. Reproductive failure occurs when rats are raised to maturity on fat-free diets.

The experiments relating to the improvement of pregnancy and lactation by the presence of adequate dietary fat suggested that it is not the caloric value of the fat *per se* that is responsible for the beneficial effects, but rather the chemical nature of the fat. Thus a small single dose of an unsaturated fat (100 mg. of ethyl linoleate) given three weeks before the animals were bred ensured a normal pregnancy. A saturated fat (hydrogenated coconut oil) was ineffective. (An unsaturated fat is one in which the fatty acid contains one or more double bonds; *i.e.*, unsaturated with hydrogen.)

Another important indication of the nutritional condition of an animal is the ability of its tissues to perform work. Two different laboratories reported that the capacity of rats to continue strenuous exercise is improved on high-fat diets as compared with diets of low fat content or fat-free.

One of the strong arguments for the use of low-fat diets was that these diets cause a lowering of blood cholesterol, the substance deposited in the lining of the blood vessels, causing narrowing of the opening, in hardening of the arteries. On the basis of recent work, however, it appeared that the lowering of blood cholesterol is accompanied by an increase in the deposits of free cholesterol in the liver and adrenals. Fats in the diet prevent these deposits from appearing under otherwise identical experimental conditions. The presence of unsaturated fats, as far as the above effect is concerned, seems to be necessary. In addition, fat-deficient rats are more susceptible to X-irradiation than are normal rats and also show greater capillary fragility and permeability.

There was good evidence that fat is an essential component of the diet for good nutrition. Some of the beneficial effects of fat depend definitely on the presence of small amounts of unsaturated fats, while other effects seem to be related to the caloric value alone.

Further work was necessary to determine what the optimum value for total fat in the diet should be and what portion of this should consist of unsaturated fats.

The Properdin System.—The adult human being, as well as other species, possesses a high degree of resistance or immunity to infection by various bacteria and viruses. A portion of this immunity is acquired; *i.e.*, an infection with certain bacteria or virus has resulted in the appearance in the blood of a definite chemical substance or antibody that can destroy or neutralize the original infecting agent at a time subsequent to the original infection. An innate (or natural) immunity also exists. Little is known of the factors or the mechanisms concerned in this phenomenon. It has been supposed that certain animals can produce substances in their blood that are similar but not identical to antibodies. These substances differ chiefly in that their production is not related to previous exposure to or infection with any bacteria or virus. Likewise, these materials are not specific; *i.e.*, they will destroy or inactivate a wide variety of infectious agents. Recent work established the existence of such a substance and the system in which it participates to result in natural immunity.

This system was termed the properdin system.

Properdin is a plasma protein (a euglobulin) that is present in varying amounts in the blood of various species of animals. Its participation in the immune reaction is believed to be as

allows: Properdin, in the presence of traces of magnesium ion normally present in plasma) combines with a substance (probably a carbohydrate) in the wall of the bacterial cell. The bacteria thus "prepared" are acted upon by a third substance, a complement (possibly an enzyme) in the plasma, and in the process the cell is destroyed. The action on some viruses is believed to be similar.

A method was devised by which it was possible to remove properdin from plasma and determine the amount present. On the basis of this method the mechanism of action and the possible role in natural immunity was established.

Among common animal species, the rat is resistant to infection, whereas the guinea pig is susceptible. When the blood of these animals was tested for normal properdin content, the rat had the higher concentration (25–50 units per millilitre) and the guinea pig the lower (1–2 units per millilitre). Human blood also has a rather low concentration (four to eight units per millilitre).

Outside the body, it is possible to demonstrate that human blood serum has a high killing power for various bacteria. Thus human serum has high bactericidal activity against a strain of *typhosy bacillus*. When properdin is precipitated and thus removed from normal serum, this serum becomes nonbactericidal.

Certain high molecular weight carbohydrates such as native dextrans or levans when injected intravenously into mice increase the susceptibility of these mice to infection. The explanation lies in the demonstration that dextran or levan combines with properdin or inactivates the complement or both.

When rats are irradiated with X-rays in high dosage over the entire body they will die as the result. An overwhelming infection in which bacteria appear in the blood in large amounts is common and a contributing factor in the eventual fatal outcome. Again the probable cause is the demonstrated very low blood level of properdin that comes about as a result of the radiation.

These experimental results briefly relate a few of the reasons that establish the properdin system as an important factor in natural immunity.

Pickersgill, John Whitney (1905–), Canadian politician and federal cabinet minister, was born on June 23 at Wycombe, Ont. He was educated at the University of Manitoba and at Oxford and Paris universities. He was a lecturer in history at Wesley college, Manitoba, 1929–37. In 1937, he became third secretary in the department of external affairs, Ottawa, but was almost immediately attached to the office of Prime Minister William Lyon Mackenzie King. In 1942, he was appointed private secretary to the secretary of state for external affairs, holding this post until 1945 when he was named special assistant to the prime minister, continuing until he was appointed clerk of the privy council and secretary to the cabinet in June 1952. Pickersgill entered politics when appointed secretary of state in June 1953 and in August of that year was elected member of parliament for Bonaville—Willingate, Nfd.

On July 1, 1954, he was named minister of citizenship and immigration.

Pickersgill became the central figure of a *cause célèbre* in national politics when early in April 1955, he said in speech at Victoria, B.C., "I do not believe any immigrant, no matter where he comes from or how good he is, is as good as another Canadian baby." Though he indicated only that he was a be-

liever in the "cradle" as the best method of increasing Canada's population and did not mean to say that Canadians were superior to foreign peoples, some sections of the press and others made Pickersgill's remark into a "Canadian baby incident" in national politics. (M. L. S.)

Pittsburgh. In 1955, the physical redevelopment program of Pittsburgh, Pa., moved ahead. The district's long-projected sewage treatment system was assured by creation of the Allegheny County Sanitary authority, with \$100,000,000 available for construction. A Regional Industrial Development corporation was organized with Gwilym A. Price as chairman and John P. Robin as president. The Metropolitan Study commission, after two years of work, proposed a plan to streamline governmental functions in 129 political subdivisions of the county.

Mellon park, in the heart of the downtown business district, made possible by a \$4,300,000 gift by Mellon family foundations, was opened together with a six-level underground garage. The Parking authority completed two additional open-deck garages, its third and fourth. The cross-town thoroughfare moved into final planning phase and clearing of teeming "lower hill" for construction of a large auditorium and convention hall seemed assured.

In Gateway centre a state office building was under construction and plans were ready for another to be built for the Bell Telephone company.

The University of Pittsburgh completed a new building for the Schools of Engineering and Mines, pushed construction of a science building, announced that it would build dormitories and a student centre, and pressed construction contracts totaling more than \$20,000,000 in the Medical centre. Pennsylvania College for Women, 86-year-old liberal arts institution, changed its name to Chatham college.

Manufacturing employment in the Pittsburgh district averaged 1% lower in the first eight months of 1955 than in the same period in 1954 and 14% lower than in the like months of 1953. Estimated total employment in the district was 2% below 1954 and 7% below 1953.

The Bureau of Business Research of the University of Pittsburgh estimated the value added by manufacturing in 1955 in the four-county Pittsburgh area to be about \$2,100,000,000 and the total value of products manufactured to be about \$4,800,000,000.

Population (1950 census), 676,806; area, 55.49 sq.mi. Local government total budgets: city, \$48,320,743; Pittsburgh school district, \$24,959,564; Allegheny County, \$37,504,191. City real estate tax rates: land, 32 mills; buildings, 16 mills. The school levy was 11¼ mills on all real estate; county, 9½ mills. Assessed taxable real estate valuation in the city was \$1,112,837,843 and in Allegheny county, \$2,634,793,147. Bonded indebtedness as of Jan. 1, 1955, was: city, \$49,421,300; school district, \$13,132,000; Allegheny county, \$94,184,000. Enrolment in public schools was 79,271; in Catholic parochial schools, 48,734.

(C. F. Ls.)

Pius XII (1875–), the 262nd successor of St. Peter in the see of Rome, was elected by the cardinals in conclave on his 63rd birthday, March 2, 1939, and was crowned as pope on March 12. (See *Encyclopædia Britannica*.)

Delayed by the grave illness he suffered during the winter of 1954, Pope Pius XII's Christmas message was published and

broadcast, unpronounced, on Jan. 3, 1955. In this document he called on all nations to live in peace and harmony. This can be achieved, the pontiff said, if "a bridge of truth" between east and west is built on the principles of Bethlehem and founded not on the "governmental or social systems" of the democratic and communist worlds but "on the divine moral order" and on the human beings living in these two worlds.

During the first two months of 1955, citizens of Rome could be seen kneeling on the cobbles of St. Peter's square in silent prayer for the pope, who was still gravely ill. On March 2, visibly ailing and weary, he appeared for seven minutes at a window of his study on the upper floor of the Vatican palace to bless the thousands of persons who had come to manifest their attachment on the day of his 79th birthday, the sixteenth of his elevation to the pontificate.

On April 3, appearing, at last, fit and vigorous, the pope made his first Palm Sunday appearance in two years. He took part in the ceremonies opening Holy week and held an audience for 1,000 delegates to the World Congress of Prevention of Work Accidents.

On April 10, Easter Sunday, the pope made his first ceremonial outdoor appearance. In a strong and clear voice he delivered his traditional message. He appealed for international talks to achieve "progressive disarmament" and "lasting understanding" among power blocs. The main part of his message, in which he imparted his blessing to the world, was devoted to the hopes and terrors of the nuclear age. Alluding to the U.S.S. "Nautilus," the pope said: "Without fear or trepidation we have noted the recent advances . . . of nuclear energy . . . in the service of men."

On April 24, at the occasion of the seating of 14 newly appointed scholars in the Pontifical Academy of Sciences, the pope defined the mission of the scientist. "The mission confided to you," he said, "ranks among the most noble, for you should be in a sense the discoverers of the intentions of God. It pertains to you to interpret the book of nature, to describe its contents and to draw the consequences therefrom for the good of all."

On Sept. 7, 1955, the pope addressed 1,500 delegates to the tenth International Congress of Historical Sciences. "The Catholic Church," he declared, "does not identify itself with any culture. This is not permitted to her by her very essence. She is, nevertheless, disposed to maintain relations with all cultures. She recognizes and allows to subsist all that in them is not opposed to nature. But in each one she introduces the truth and the grace of Jesus Christ and thereby confers a deep likeness on them all." (See also ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.) (J. LaF.)

Planned Parenthood: see BIRTH CONTROL.

Plastics. Unrevised totals for 1953 and 1954 production of plastics and synthetic resins in the U.S. are given in the table.

Much of the development work which took place in the plastics industry in 1955 centred on a group of improved resin formulations which were made available during the year.

Among these was a new type of polyethylene produced by a catalytic technique and known to the trade by various names, including, among others, low-pressure polyethylene, high-modulus polyethylene, high-density polyethylene and Ziegler process polyethylene. Although methods of production varied among the several producers, accounting in part for the confusion in nomenclature, all of the new polyethylenes were characterized in general by higher heat resistance (up to 250° F. or slightly higher), greater rigidity and stiffness and higher impact strength than conventional polyethylenes. While the new material would prob-

Production of Plastics and Synthetic Resins in the U.S.

	(in pounds)	1954	1953
Cellulose plastics (all)*†		123,200,000	129,000,000
Phenolic and other tar acid resins * †		396,000,000	460,200,000
Urea and melamine ‡		253,350,000	242,600,000
Styrene and styrene-derivative polymer and copolymer resins*		500,100,000	492,300,000
Vinyl resins		516,800,000	511,400,000
Miscellaneous§		539,150,000	446,600,000

*Includes fillers, plasticizers and extenders.

†Includes sheets, rods, tubes and moulding and extrusion materials.

‡All dry resin except moulding material which includes filler.

§Includes acrylic, polyethylene, nylon, silicone and other resinous moulding materials, as well as petroleum resins and coumarone indene.

Source: U.S. Tariff Commission.

ably overlap into many fields now serviced by conventional polyethylene (which, continuing its phenomenal growth, was estimated to have reached a consumption figure of 330,000,000 to 340,000,000 lb. in 1955), it was expected primarily to broaden the over-all base for plastics applications, especially in such markets as toys, housewares, packaging, piping and industrial components.

Considerable activity was also noted in the production and use of nylon moulding material in 1955. Manufacturers found increasing use for moulded nylon wheels, cams, bearings, gears and component parts. Similarly, polyester film, which started to move into prominence in 1954, broadened its market areas in 1955 to take in a variety of new applications ranging from recording tapes, chemical drum liners and electronic capacitors to ladies' shoes, metallic fabrics and toys.

Interest in polyurethane foams for upholstery, clothing and industrial applications was stimulated by indications that there would be large-scale production in the United States within the next few years. Vinyl foams moved in increasing volume into such end products as arm rests, crash pads, gasketing, wearing apparel, cushioning and packaging. The mouldable styrene foam introduced in 1954 also showed up in 1955 in a number of new

DEMONSTRATION OF STRENGTH OF MYLAR polyester film, under full scale production by the du Pont company in 1955. The material has a tensile strength of about 23,500 lb. per sq.in. Its chief use is for electrical insulation either alone or laminated to other materials

applications ranging from Christmas displays to huge ball-shaped marine floats.

Other variations in moulding compounds introduced during the year included a new form of cellulose acetate with a high heat distortion point of 225° F. and low moisture sensitivity and a new lightweight plastic, combining styrene, acrylonitrile and butadiene for exceptionally high impact strength.

Great strides were made during 1955 by the sheet-forming industry. Refinements in both machinery and methods made possible the forming of larger, more intricately designed pieces to greater depths—and consequently opened new outlets for formed pieces in packaging, displays, toys, housings and various industrial components. A few companies also set up continuous automatic production lines for sheet forming, and more appeared to be in the offing for 1956.

Another moulding technique which gained momentum during 1955 was known as premix or gunk moulding. This method involves the mixing together of resin, filler, reinforcement, catalyst and other ingredients into a puttylike mass which is then weighed out and inserted into the mould. The technique offers a means for economical and rapid moulding of parts with varying wall thicknesses, intricate contours and moulded-in inserts. In 1955 its biggest application was for automotive parts.

Also of note in 1955 was the development of techniques for laminating sheets of decorative, abrasion-resistant vinyl to metal or to reinforced plastics and then forming the combinations into housings, doors, etc. Another application which aroused interest was melamine tableware produced by moulding a lithographed foil as an integral part of the finished piece. Poland. A people's republic of eastern Europe, Poland is bounded east by the U.S.S.R., south by Czechoslovakia, west by Germany and north by the Baltic sea. Area: 20,359 sq.mi. Pop.: (1950 census) 24,976,926; (1955 est.) 27,100,000; national minorities (Germans, Jews, Byelorussians, Ukrainians, Lithuanians, Slovaks and Czechs) 250,000. Language: Polish. Religion: Roman Catholic. Chief towns (pop., 1955 est.): Warsaw 965,000; Lodz 670,000; Wroclaw 490,000; Cracow 430,000; Poznan 370,000; Szczecin 300,000; Gdansk 180,000; Stalinogrod (Katowice) 200,000 and 11 other towns with a population of more than 100,000. First secretary of the Polish United Workers' (Communist) party in 1955, Boleslaw Bierut; chairman of the council of state, Aleksander Zawadzki; chairman of the council of ministers, Jozef Cyrankiewicz.

History.—*Foreign Affairs.*—In 1955, both the Warsaw government and the Polish nation followed anxiously the attempts at solving the German question. While both were in agreement as to the necessity of maintaining the existing Polish-German frontier, there was probably divergence between them as to the divisibility of German reunification under a really representative government. All escapees from Poland affirmed that the Polish people would welcome the reunification of Germany, if that would mean for Poland a common frontier with the free world. The Communists considered such an eventuality dangerous.

Following a similar decision of the U.S.S.R., the Warsaw gov-

STALIN PALACE OF CULTURE AND SCIENCE, opened in Warsaw, Pol., in July 1955

ernment on Feb. 18 passed a decision terminating a state of war between Poland and Germany.

The second conference of seven European people's democracies and the U.S.S.R., held in Warsaw from May 11 to 14, was attended by their respective premiers and foreign and defense ministers. At the first conference held in Moscow from Nov. 29 to Dec. 2, 1954, it had been decided to strengthen and further co-ordinate their military power if the Paris agreements were ratified. As N. A. Bulganin, the Soviet premier, said in Warsaw, the ratification of these agreements created a new situation. A collective treaty of mutual assistance was signed on May 14 by the eight premiers. On the same day Marshal Ivan S. Konev was appointed commander-in-chief of the unified armed forces. By May 30 all the signatory states had ratified the Warsaw treaty.

On July 6, the fifth anniversary of the signing of an agreement between Poland and the German Democratic Republic on the demarcation of the Polish-German frontier, celebrations were held in Warsaw and in east Berlin. Otto Grotewohl, east German premier, visited Warsaw, while Bierut went to Berlin. The two governments published a declaration which stated that the Oder-Neisse frontier was final.

Home Affairs.—Jozef Swiatlo, a high official of the Polish ministry of state security, who had escaped from Poland in Dec. 1953, was broadcasting from Sept. 1954 through Radio Free Europe a series of talks disclosing the details of the Polish police-state system. This campaign had unexpected results in Poland. Stanislaw Radkiewicz, minister of state security, was dismissed on Dec. 7, 1954, the ministry was disbanded and a committee of state security was created instead at the ministry

of the interior. The *Trybuna Ludu*, the chief party organ, called on the newly created committee to extirpate all manifestations of misuse of state power and to preserve respect for law and justice. In Jan. 1955 Roman Romkowski, deputy minister of the former ministry, and Jacek Goldberg-Rozanski and Anatol Fejgin, its former two directors, were arrested for "using forbidden methods of investigation" and "gross cases of despotic action." Many innocent persons were released from prisons and forced labour camps of which there were at least 226, including 64 for women, with a total of about 180,000 inmates.

Another development was the calling back to Poland of the Polish *émigrés* and political exiles. In August thousands of Poles in Great Britain, the United States, France and other countries received by post at their private addresses an appeal signed by 45 names inviting them to return home to help in building a new Poland. The letter contained a quotation from a speech by Bierut in which it was said that the people's Poland would generously forget "all the guilts and faults" of those returning. Among the few Poles who had returned by the end of the year was Hugon Hanke, the so-called "premier" of the Polish government in exile, no longer recognized by an overwhelming majority of Polish political leaders in exile.

Polish organizations abroad countered this Warsaw campaign by asking (through the British Broadcasting Corporation, the Voice of America and Radio Free Europe) what had happened to at least 200,000 Poles detained in Soviet prisons and camps of forced labour, among them 16 Polish underground leaders who were arrested at the beginning of 1945. In October, breaking a nine-year silence, the Soviet authorities admitted that one of the 16 leaders, Gen. Leopold Okulicki, last commander of the underground Polish anti-German army, had died in a Moscow prison on Christmas eve 1946. (See also EASTERN EUROPEAN ECONOMIC PLANNING.) (K. SM.)

Education.—Schools (1953-54): nursery 8,200, pupils 380,000; primary 22,980 (including 14,116 seven-grade); pupils about 3,000,000, teachers about 100,000; special 111, pupils 13,800; secondary 792, pupils 195,000, teachers about 5,000; vocational about 3,000, pupils 474,000; teachers' training colleges 149, pupils 44,000; adult education courses 980, pupils 145,000; institutions of higher education 82 (including 7 state universities, 1 Catholic university at Lublin and 8 colleges of engineering), students 136,000 (including 1,967 at the Catholic university).

Finance.—Monetary unit: zloty with official exchange rate, high and fictitious, of 4 zlotys to the U.S. dollar. Budget (1954 est.; 1955 est. in parentheses): revenue 115,350,000,000 zlotys (122,000,000,000 zlotys); expenditure 103,480,000,000 zlotys (114,900,000,000 zlotys), including 53,600,000,000 zlotys (60,800,000,000 zlotys) invested in the national economy.

Foreign Trade.—(1938; 1950 in parentheses). Exports U.S. \$223,000,000 (U.S. \$631,000,000); imports U.S. \$231,000,000 (U.S. \$844,000,000). Main sources of imports (1950): U.S.S.R. 40.1%; Czechoslovakia, Hungary, Rumania and Bulgaria 18.3%; Germany (eastern and western) 15.5%; U.K. 2.2%; rest of western Europe 14.6%; U.S. 1%. Main destinations of exports (1950): U.S.S.R. 23.2%; four eastern European countries 24.6%; Germany 13%; U.K. 7.7%; rest of western Europe 27.7%; U.S. 1.7%. In 1955 the Soviet share in Polish foreign trade amounted to 38%, that of people's democracies (including German Democratic Republic and China) to 32%. Polish trade with 17 western European countries (1952; 1953 in parentheses): exports U.S. \$258,000,000 (U.S. \$235,800,000); imports U.S. \$172,000,000 (U.S. \$154,100,000).

Transport and Communications.—Railways (1950, standard gauge): 24,552 km.; passenger traffic (1950) 26,352,000,000 passenger-km.; freight traffic (1950) 32,000,000,000 ton-km.; freight carried 148,128,000 metric tons. Roads (1950, hard surfaced): 96,605 km. Licensed motor vehicles (1950 est.): cars 30,000; commercial 40,000. Shipping (1954, ships of 100 tons and over): vessels 142, total tonnage 291,000 gross tons. Freight traffic in Polish ports (external trade, metric tons, 1950): loaded 12,453,000, unloaded 3,215,000. Ships entered (1950): 7,250,000 net registered tons. Air transport (1953): 2,507,000 km. flown; 3,334,000 passenger-km. Telephones (1954): 235,000. Radio licences (April 1954): about 1,500,000; loudspeakers served by relay stations 1,250,000.

Agriculture.—Main crops (metric tons, 1934-38 average within post-1945 boundaries; 1951-53 estimated average in parentheses): wheat 1,965,000 (1,600,000); barley 1,632,000 (1,000,000); rye 6,854,000 (6,300,000); oats 2,830,000 (2,000,000); millet 130,000 (61,000); potatoes 38,014,000 (28,200,000); sugar beets 5,962,000 (7,700,000). Sugar, raw (1948-50 average; 1953 in parentheses): 954,000 (1,120,000). Livestock (1950; 1953 estimates in parentheses): cattle 7,164,000 (7,400,000); pigs 9,928,000 (8,400,000); sheep 2,194,000; horses 2,797,000.

Industry.—Employment outside agriculture (1938; 1954 estimate in parentheses): 2,730,000 (6,000,000). Production (metric tons, 1938; 1954 in parentheses): coal 38,104,000 (91,256,000); lignite 10,000 (7,200,000); crude petroleum 507,000 (250,000); electricity 3,977,000,000

kw.hr. (15,000,000,000 kw.hr.); pig iron 880,000 (2,400,000); steel 1,441,000 (4,000,000); zinc, metal 108,000 (1955, plan: 198,000); cement 1,719,000 (3,500,000).

Pole Vaulting: see TRACK AND FIELD SPORTS.

Police. Problems of economy and efficiency were of primary concern to police administrators of the United States in 1955. They were confronted at the beginning of the year with an unbroken seven-year upward crime trend and with a 35% increase in operating cost since 1950 (based on the average of the per capita costs in all population groups). The principal increment in expenditures resulted from salary increases, which amounted to 25% for patrolmen and 22% for chiefs (based on the average of median salaries in all population groups). Salary expenditures had increased 39%; the difference between this figure and the salary increment is accounted for by additional policemen.

Police employees in state and local governments increased from 248,000 to 259,000 (more than 4%) between Oct. 1953 and Oct. 1954. City police employees increased from 164,000 to 171,000 (more than 4%) between April 1954 and April 1955. Employees in the latter group who were without arrest power (civilians) increased 7% to 16,000. The percentage of police employees who were civilians increased from 7.5 in 1950 to 9.6 in 1955. Substitution of civilians for police officers in clerical, communications and other inside work, as well as such outside tasks as guarding school crossings and checking compliance with parking regulations, was responsible for this trend.

Effective police manpower had not increased in proportion to the number of men added to the forces. Shortened work weeks and more liberal provisions for annual and holiday leaves absorbed a substantial part of the added manpower. For example, a change from a 48- to a 40-hour week decreases available man-hours by about 17%. A total of 132 cities of more than 10,000 population reduced the police work week in 1954, compared with 122 cities in 1953 and 159 in 1952. The work week was reduced to 40 hours in 57 of the 132 cities.

The 1955 police administrator was thus confronted with the problem of meeting demands for shorter work weeks and pay increases, of checking the upward crime trend and of avoiding prohibitively high operating costs. The solution lay in the more effective use of manpower.

Efforts of the police to use their forces more effectively in preventive patrol was apparent in trends toward more complete motorization and greater use of one-man patrol cars. Among 235 cities of more than 50,000 population, the number of patrol cars increased one-third between 1950 and 1955, and the number of departments that used some one-man patrol cars on all three shifts and the number that used one-man cars exclusively both increased 19% in the same period. The exclusive use of one-man cars had increased 78% in all cities since 1950.

The police continued to demonstrate their appreciation of the value of mechanical and electrical devices. Several departments adopted crash helmets for their motorcycle officers and seat straps for their cars. More than 600 radar units were in use for scanning the speed of motorists. Mobile emergency headquarters units for communications during disasters were provided in increasing numbers. Teletype networks increased in number and coverage. Some departments experimented with small radio receivers for their foot patrolmen. Increased use was noted of punch-card sorting and tabulating machines for statistical analyses, bookkeeping tasks, processing traffic tickets and warrants and searching fingerprint files.

In 1954, 61 city police employees, as compared with 63 in 1953, were killed while on active duty in cities that represented more than 97% of the urban population. Deaths from any mis-

hap, such as traffic accidents, incurred in line of duty are included. On the whole, the death rate among policemen was highest in the states that had the highest aggravated assault rate. The death rate was highest in cities of less than 10,000 population (6.6) and lowest in cities between 10,000 and 25,000 (2.0). Cities of more than 250,000 inhabitants had a death rate of 2.6, compared with 4.3 for cities between 100,000 and 250,000; with 2.8 for cities between 50,000 and 100,000; and with 4.8 for cities between 25,000 and 50,000.

The 1955 experience of the police in England and Wales was similar to that in the U.S. in some respects. The work week was shortened, pay increases were granted, pensions for police widows were improved and about 2,000 police houses were built. During the year there was a continuing diminution in police strength, although the number of policewomen rose slightly.

The 62nd annual conference of the International Association of Chiefs of Police was held in Philadelphia, Pa., in Oct. 1955. More than 1,000 police executives were in attendance, with nearly 40 representatives from Canada, China, Egypt, Germany, Guatemala, Indonesia, Iran, Japan, the Philippine republic and Thailand. Subjects of special interest discussed at the conference included traffic, civil defense, public relations, juvenile delinquency, professionalization, police training in colleges and universities, one-man patrol car operation, legal restrictions that hamper the police, and the American Bar foundation survey of the administration of criminal justice. (See also CRIME; FEDERAL BUREAU OF INVESTIGATION; SECRET SERVICE, U.S.)

(O. W. W.)

Poliomyelitis. The year 1955 was one of excitement, temporary disappointment and strongly renewed hope for the prevention of paralytic poliomyelitis by vaccination against it. The Salk vaccine was the centre of interest and of controversy.

In 1954 the National Foundation for Infantile Paralysis undertook and paid for a nation-wide poliomyelitis vaccine field trial to determine whether the vaccine developed by Jonas Salk of the University of Pittsburgh, Pa., could in fact protect children against paralytic poliomyelitis under natural conditions of exposure to the disease. In the course of this trial, the largest controlled medical experiment in history, 440,000 children received three injections each of the Salk vaccine, 210,000 got injections of a harmless pink fluid (placebo) and 1,830,000 were kept under observation for possible polio attacks until Jan. 1, 1955.

For the first three months of 1955, a time of relative quiet on the polio front, the enormous amount of information collected in the field trial was studied and analyzed at the Poliomyelitis Vaccine Evaluation centre established at the University of Michigan, Ann Arbor. The centre and the study were under the direction of Thomas Francis, Jr., professor of epidemiology. The study was kept in secret code to prevent premature and incorrect leaks of information.

On April 12 a scientific convocation was called at the University of Michigan to hear and assess Francis' evaluation of the field trial and the Salk vaccine. Approximately 500 scientists and physicians most concerned with poliomyelitis attended the meeting.

The Francis Report.—The Francis report, as it was immediately named, marshalled convincing evidence that the Salk vaccine was both safe and effective. Concerning the safety of the vaccine, Francis noted that neither minor reactions, such as fainting, dizziness or mild skin rashes, nor so-called major reactions, such as high fever, paralysis or kidney disease, could be attributed to the vaccine. These reactions occurred with equal or greater frequency among children who had received only inoculations of the harmless placebo substance. Nor was there

any evidence at all that the vaccine was a source of poliomyelitis infection.

In measuring the effectiveness of the vaccine, Francis placed greatest reliance on the evidence obtained from the placebo study areas, where strictly controlled and almost identical populations were compared. "On this basis," he told his audience, "it may be suggested that vaccination was 80 to 90 per cent effective against paralytic poliomyelitis; that it was 60 to 70 per cent effective against disease caused by Type I virus and 90 per cent or more effective against that of Type II and Type III virus."

(There are only three immunologic types of polio virus known, though there are many hundreds of strains of polio virus. Each type is capable of causing paralytic disease. However, in any epidemic situation, one or another type is usually predominant. One of the most important features of the Salk vaccine is the fact that it is trivalent, offering protection against all three types of polio virus. In making the vaccine, the virus is inactivated [or killed] by treating it with formalin.)

Salk's New Dosage Schedule.—Salk was also a speaker at the April 12 meeting in Ann Arbor. After crediting, with due modesty, the many other investigators whose efforts had made possible the development and evaluation of the vaccine to which his name was attached, he pointed out the following important results of his continuing research:

The vaccine available in 1955 was an improvement over that made in 1954 because it had been since discovered how to prevent and avoid the damaging effect of a chemical preservative added to the vaccine.

A better dosage schedule for giving the vaccine had been worked out. Salk's new dosage schedule, put into effect in 1955, called for a second injection of vaccine two to four weeks after the first injection and a third injection, or booster shot, to be given at least seven months later. The effect of this "full immunization" schedule, Salk said, would be to increase greatly the level of protective antibodies against the disease, often above the level produced by an attack of the disease itself, and also to extend considerably the length of time that the artificially induced immunity to paralytic polio would last.

(The duration of immunity produced by the Salk vaccine had not yet been determined by the close of the year. This matter was still subject to extensive and continuing scientific research. Records of inoculated children must be reviewed for many years. Animal experiments were also being conducted. The weight of scientific opinion was that full immunization with three injections of the Salk vaccine, the third injection being delayed seven months, would provide a high degree of protection against paralytic polio for a considerable number of years.)

Vaccine Licensed.—Another event of April 12 was the licensing of the Salk vaccine as "safe, pure and potent" for general use, sale and distribution by the Laboratory of Biologics Control of the National Institutes of Health, a part of the U.S. public health service legally responsible for licensing all biologic products. On the basis of convincing evidence supplied by the Francis report and other data, the U.S. secretary of health, education and welfare issued licences for immediate distribution of the vaccine to six commercial manufacturers who had been in the process of making it for many months beforehand according to certain "minimum requirements" previously established. The six firms were: Cutter laboratories; Eli Lilly and company; Parke, Davis and company; Pitman-Moore company (division of Allied Laboratories, Inc.); Sharp and Dohme division of Merck and Company, Inc.; and Wyeth laboratories.

The summarized scientific content of the Francis report, Salk's new dosage schedule and the announcement of the licensing of the vaccine were immediately communicated on April 12 to approximately 40,000 physicians in the U.S. and Canada through

EMERGENCY WARD of the Haynes Memorial hospital, Boston, Mass., filled with iron lungs after an epidemic of polio in Aug. 1955

a closed-circuit television broadcast to 64 cities.

Vaccine Supply.—In Oct. 1954, six months before the results of the Francis report were known, the National Foundation for Infantile Paralysis had taken a "calculated risk" of placing advance orders for 25,000,000 c.c. of vaccine. It had also made advance plans, in co-operation with public health officers, school officials and medical societies, for the administration of this vaccine before the 1955 polio season to all children in the first and second grades in school and to "polio pioneers" of the 1954 field trial.

Approximately 9,000,000 children were eligible for this 1955 vaccine program. The National foundation's calculated risk was considered both a moral obligation and a practical expedient for assuring a vaccine supply in 1955. It permitted vaccine manufacturers to keep production lines going and it recognized the critical fact that vaccine production and safety testing took time (now a minimum of 120 days, formerly 90 days).

Temporary Setback.—The 1955 vaccine program got under way on April 16 in San Diego, Calif. Within ten days it began to run into difficulties. In California and Idaho a disproportionately high number of cases of poliomyelitis were reported suddenly among children who had received the vaccine. These cases were quickly traced to two lots of vaccine from one manufacturer. It was soon evident that there had been some sort of a laboratory accident. The offending vaccine was immediately withdrawn. But on May 7 the surgeon general of the U.S. public health service called the entire nation-wide immunization program to a halt.

Public Health Service Technical Report.—Several hectic weeks of investigation and conference with experts on the part of the public health service took place. On May 26 a revised set of minimum requirements for the manufacture and testing of the Salk vaccine were promulgated, making, as it was said, "a safe vaccine safer." These technical revisions called for larger testing samples, for two consecutive negative tests of vaccine pools and for tests of random samples of final containers, and also forbade certain reheating practices. A technical report on the Salk vaccine was issued by the public health service on June 10, saying in part:

"Events which in the traditional course of scientific development would have covered years were telescoped into months and,

as a result, both successes and failures have been magnified. . . . We are therefore concerned with an effective vaccine for the prevention of poliomyelitis, and we are concerned with a safe vaccine. . . . We have every belief that this vaccine will fulfill its bright promise."

A subsequent public health service report of Aug. 25, dealing with the specific circumstances that had interrupted the vaccine program, declared that investigation of manufacturing practices and consideration of detailed processing data "warrants the presumption that a combination of inadequate inactivation and failure of the safety tests permitted the presence of undetected infective amounts of live virus in some lots of vaccine." However, the public health service again repeated its belief that the revised minimum requirements of May 26 "provide adequate safeguards for the routine production and use of poliomyelitis vaccine."

6,500,000 Children Vaccinated.—Vaccine was again released by the public health service in June, at first in dribbles, then in ever-increasing quantities. By fall approximately 6,500,000 U.S. children had received at least one injection of vaccine and about half this number had two injections. With the reopening of schools in the fall, the vaccine program was stepped up. So long as the vaccine was in short supply, priorities for its use were established. Priorities were based on past experience of poliomyelitis attack rates in various age groups. The first priority category was the 5 to 9 age group; to come thereafter, in order, 6 months to 5 years, 10 to 14 years, 15 to 19 years and pregnant women.

Results of 1955 Vaccine Program.—It became evident quite early in the usual polio season that even one injection of the Salk vaccine was helping to cut down the 1955 incidence of paralytic polio among the children who received it. The attack rate was only one-quarter to one-third as high among vaccinated as among unvaccinated children.

These promising early results encouraged hopes and plans for "universal vaccination" against paralytic polio in the near future. Active research programs, looking toward a still better vaccine and improved methods of making it, continued throughout the year. Especial effort was directed toward finding cells other than monkey kidney cells (from monkeys imported from India) on which the polio virus needed for vaccine manufacture could be grown in tissue culture. The possibility of producing a live virus vaccine also continued under investigation.

Continued Need for Rehabilitation.—In spite of the vaccine program a substantial number of cases of poliomyelitis, approximately 30,000, were reported in the U.S. in 1955. This emphasized the fact that patients stricken with paralytic polio before or, occasionally, in spite of vaccination would continue to need help and rehabilitation. It was estimated that among the 750,000 people in the United States who still endured moderate to severe aftereffects of paralytic polio, at least 35,000 needed and would benefit by full-scale rehabilitation programs. To assist patients in iron lungs, and if possible to free them from this device, two new respiratory centres, one in New York city and one in Columbus, O., were opened in 1955, bringing the total of such centres in operation to 14.

The U.S. was not alone in beginning a vaccine program in 1955. An excellent program was inaugurated under governmental auspices in Canada, where nearly 1,000,000 children received two doses of Canadian-made Salk vaccine without a mishap. In Denmark about 500,000 children were vaccinated.

Political Parties, British. **Conservative Party.**—The year 1955 was an important one in the history of the Conservative party. On April 6 Sir Winston Churchill resigned the premiership, and was succeeded by Sir Anthony Eden. On April 21 Sir Winston's resignation as leader of the party (a post he had held for 14 years) was read and Sir Anthony Eden was appointed his successor.

The general election resulted in the Conservative majority over Labour rising from 26 to 67, and over all parties from 18 to 58. Only three Conservatives lost their seats, two being victims of the redistribution of boundaries. This was the first occasion in 90 years when a government had increased its majority, and previously, spring elections had not been considered fortunate for the Conservative party.

Apart from the Finance bill, the legislation before the general election was not of a major character. It included an act to protect children from harmful publications, colonial development and welfare and a measure affecting Scottish crofters, while further improvements in benefit rates under the National Insurance act came into operation.

During the year the Conservative party maintained an individual membership of 2,750,000 in England and Wales. The six by-elections before the general election showed no change. The Conservatives held five and Labour one.

About 4,000 representatives attended the Bournemouth conference in October. Several resolutions congratulated the government; others called for economy, electoral reform, copartnership, expansion of technical education and vigorous action against monopolies. One resolution, which was rejected, advocated an extension of postal voting to the holidays. R. A. Butler, chancellor of the exchequer, spoke of the dangers of inflation and intimated clearly that the necessary measures would be taken.

For the first time Sir Anthony Eden addressed a mass meeting at the end of the conference as premier and leader of the party.

The Young Conservatives had 145,000 members and 2,000 branches in 1955, and claimed to be the largest voluntary political youth movement in the free world.

Publicity and organizational activities reached a climax during the general election campaign when from party headquarters alone 14,000,000 leaflets and 180,000 posters were issued.

(M. C.-W.)

Labour Party.—The total membership of the Labour party as returned in the 1955 report was 6,498,027. Of this figure, 5,529,760 was trade union affiliated membership, 933,657 individual membership and 34,610 Socialist and co-operative society membership.

The major event for the party during the year was the general election. Labour put forward 620 official candidates, of whom 277 were elected. There were 26,760,661 votes cast, representing 76.8% of the electorate, compared with 82.6% in 1951. Labour polled 12,405,246 votes, 46.3% of the total, 1,500,000 less than in 1951. Comparison with previous elections is complicated by the fact of redistribution; over the country, four Labour and two Conservative seats were abolished, and three Labour and eight Conservative seats were created. Thirty-seven seats were won on minority votes, 25 Conservative, 11 Labour and 1 Liberal. Apart from the general election there were nine by-elections during the year. None of these involved any change in representation.

Labour's election manifesto, entitled "Forward With Labour," approved at the start of the election campaign by the National Executive committee, was based on the party's policy "Chal-

lenge to Britain." The manifesto covered all aspects of policy. In international affairs it called for immediate top-level talks, a cessation of hydrogen bomb tests and the admission of Communist China to the United Nations. In home affairs the emphasis was on checking the rise in prices and strengthening the social services. Producer marketing boards were proposed for the distribution of agricultural and horticultural produce.

The Labour party in parliament was highly critical of the government on home economic affairs and urged greater action in international affairs. A resolution moved by C. R. Attlee called again for top-level talks between the Soviet Union and the west. Another resolution, moved by Edith Summerskill, asked for an international scientific conference to study the effects of nuclear tests. The 1955 budget was criticized as being in contrast with the government's grim economic policy a few weeks earlier; it was suggested that it was an "electioneering" budget. It was also criticized for bestowing benefits once again predominantly on companies and the well-to-do.

The annual conference at Margate in Oct. 1955 was devoted mainly to electoral organization and future policy. A new program of policy statements was announced, and a document on party organization was discussed and received. The National Executive committee elected E. G. Gooch as chairman, and Miss Margaret Herbison as vice-chairman for the year 1955-56.

On Dec. 7 Clement Attlee resigned his 20-year leadership of the Labour party and received an earldom from the queen. Hugh Gaitskell was elected as his successor. (A. W. Bx.)

Liberal Party.—The general election was more memorable for the British Liberal party than for either victors or defeated challengers. It was the first since 1929 in which Liberals did not lose both seats and many votes. Declarations on the night of May 26 suggested the likelihood of a greatly increased total poll and possibly more M.P.'s, with only one more candidate (110) than in 1951; but changed local circumstances caused slumps that shattered both prospects. Representation remained at six, with seats and members unchanged. Aggregate votes fell 8,000 to 722,395. But the Liberal percentage of all votes (2.7) was up by 0.15.

In North Devon, Hereford and Denbigh, Liberals were newly in second place. At Inverness, where a by-election in Dec. 1954 gave the first strong hint of a hopeful trend, John Bannerman, Scottish rugby international, chairman since September of the Scottish Liberal party, reduced the Conservative majority to 966; and in Orkney and Zetland Joseph Grimond, Liberal whip, had a clear majority for the first time.

The manifesto, "Crisis Unresolved," was widely acknowledged as the clearest election warning of economic difficulties that were acute by summer. It treated the danger as a continuance of the crisis with which the Liberal manifesto dealt in 1951. Its remedies were freer economy, reduced public expenditure and more incentives for workpeople.

The assembly's general effect was restatement. Chief developments were the assertion of general armaments limitation as a greater step toward peace than abolition of thermonuclear weapons; a call for revision of the United Nations charter and to give right of entry to all sovereign states accepting the charter's terms.

(R. A. Sm.)

Political Parties, U.S. A heart attack suffered by Pres. Dwight D. Eisenhower in Sept. 1955 upset all previous political calculations and left both major political parties uncertain at the close of the year about the identity of their 1956 presidential candidates and those candidates' chances for election.

Before he was stricken, there was an almost universal assumption in political circles that the president would seek a

second term. Eisenhower himself said nothing to clarify the enigma surrounding his intentions. He suggested at times that any new term bid on his part was doubtful. At other points he seemed to be enjoying the presidency with a verve that indicated he wanted four more years of it despite his advancing age, 65 on Oct. 14.

The president's heart attack stunned Republicans. It left them in palpable confusion as to their campaign plans and their nominee. Democrats accepted the stricture with genuine outward sorrow but also with an inward surge of hope that, with Eisenhower off the G.O.P. ticket, their nominee might have a much better chance of election.

The immediate reaction of most leaders of both parties was that the president would not run again. But as the doctors' bulletins from his sickroom at Fitzsimons Army hospital in Denver continued to glow with reports of his progress toward recovery, hopes revived in the Republican leaders that he would find himself able later to undertake a limited campaign for re-election. These hopes were bolstered as the president was welcomed rousingly back to Washington, D.C., went to his Gettysburg, Pa., farm and began to resume his White House duties on an ever-increasing scale.

If the president decided not to run, the field of potential Republican candidates ranged from the reluctant to the anxious, from the experienced to the merely hopeful.

By his discreet handling of a delicate role immediately after the president's heart attack, Vice-Pres. Richard M. Nixon appeared to have enhanced his position as a possible heir apparent. Evidently sobered by the responsibility that was his as a man separated from the presidency by a single heartbeat, Nixon took steps in a New York speech to sound a bipartisan viewpoint far more pleasing to the Democrats than the Republican speeches he had made during the 1954 congressional campaign.

In that campaign Nixon had become the number-one target of Democrats angered by his remarks indirectly linking them with communism. They were so stirred they assembled what they called a "chamber of smears," largely from clippings of his campaign speeches. Their attack was so vigorous that Republican National Chairman Leonard W. Hall charged the opposition with operating "a highly organized campaign . . . to besmirch" the vice-president.

In a frank mood in March, Nixon had told the Republicans that as a party they were "not strong enough to elect a president." He said the G.O.P. had to have "a presidential candidate strong enough to get the party elected." His plain implication at that time was that only Eisenhower could fill this role.

In the mind of some party leaders another Californian, Chief Justice Earl Warren, ranked above Nixon among the G.O.P. presidential possibilities if Eisenhower did not run. Although Warren said in April that his purpose to remain on the bench was "irrevocable," there remained the possibility that he might change his mind if Eisenhower himself requested Warren to do so.

A third Californian, Sen. William F. Knowland, was less reluctant. Knowland, the senate Republican leader, said as early as January that he would not join in a "draft Eisenhower" movement. He said he did not think the Republicans wanted a "reluctant" candidate who had to be pushed into making a race. After the president's heart attack, Knowland said that if Eisenhower did not plan to run again he should make the fact known early so the country could appraise other candidates.

The possible candidacies of Nixon, Warren and Knowland all were clouded to some extent by the announcement of Gov. Goodwin J. Knight that he wanted California's G.O.P. convention votes pledged to him as a favourite son candidate, although he conceded he was no serious contender for top place on the

ticket.

There was a widespread outbreak of possible favourite son candidacies among the Republicans. Included in this category were governors Christian Herter of Massachusetts, Walter J. Kohler of Wisconsin, William G. Stratton of Illinois and others less widely known on a national scale.

Harold E. Stassen, previously an unsuccessful bidder for the Republican nomination, remained in the public eye while functioning as Eisenhower's special assistant for disarmament. Some politicians took at less than face value the contention of former Gov. Thomas E. Dewey of New York, twice the Republican nominee, that he had retired from the active field. There was mention of the president's brother, Milton Eisenhower, president of Pennsylvania State university, University Park, and many others.

On the Democratic side, the principal contender at the end of the year seemed to be Adlai E. Stevenson, former Illinois governor who met defeat at Eisenhower's hands in 1952. Despite his loss of four southern states in that year, Stevenson was regarded generally as the man to beat for the Democratic nomination.

One who might undertake that task was Sen. Estes Kefauver of Tennessee, a 1952 primary election winner who did not fare well when the chips came down for Stevenson at the party's 1952 nominating convention.

Voluntarily confined to an early role as New York state's favourite son, Gov. Averell Harriman gravitated more and more toward a position where he might become the candidate if Stevenson stumbled in his race for the nomination.

Behind Harriman was an imposing line of potential favourites, best known of whom was Sen. Lyndon B. Johnson of Texas, the senate's Democratic leader. Himself a victim of a heart attack in midsummer, Johnson's return to physical vigour was marked by his political manoeuvrings to set the stage for the 1956 convention's selection of what he called a "moderate" candidate and the writing of a platform that would offend neither of the divided northern and southern wings of the party.

Gov. G. Mennen Williams of Michigan made it clear he would be receptive to a nomination if Stevenson were eliminated. Sen. Stuart Symington, a Missourian who had warred with the Eisenhower administration on the issue of whether the free world or the U.S.S.R. controls the air, continued to be regarded as a dark horse candidate. Gov. Frank J. Lausche of Ohio was a possible favourite son aspirant.

Former Pres. Harry S. Truman switched suddenly to a waiting game after saying four times between April and August that he was for Stevenson for the nomination. Truman said in November he was not backing any candidate and would not make up his mind until the following spring.

In congress, where the legislative records the two parties would carry into the presidential and congressional campaigns were being written, the Democrats generally pursued what Speaker of the House Sam Rayburn, Texas Democrat, described as a "loyal opposition" course. Senator Johnson undertook to get along with the president on many issues but marshalled his forces for telling upsets of the Republicans on several political questions.

At the close of the congressional session, when Eisenhower said that not enough of his proposals had been passed, Johnson fired back that the Democratic-controlled senate was not a "rubber stamp" and would not follow presidential instruction "like a bunch of second lieutenants carrying out orders."

In most instances, congressional Democrats went along on foreign policy matters. They helped save the president's foreign trade program from an attack by Republican protectionists and gave him the defense appropriations he asked. But they too

"DON'T WORRY 'BOUT THE BOVINE," a cartoon of 1955 by Manning of the McNaught Syndicate, Inc.

sharp partisan exception to his highway construction, school building and farm programs. They boosted his housing and minimum-wage recommendations. They tried unsuccessfully to cut individual income taxes \$20 a year as a basis for whooping up the 1956 issue that they were for the "little fellow" while they tried to hang a "big business" sign on the Eisenhower administration.

In this latter connection, the Democrats centred fire on big businessmen they contended had violated ethics by permitting a conflict of interest while they held federal appointment. Biggest Democratic target on this score was Harold E. Talbott, secretary of the air force, who resigned after a controversy over his alleged solicitation of business for an engineering firm in which he was interested.

The Democrats fought to the point of a presidential cancellation the Dixon-Yates contract for construction of a private power plant to supplement the Tennessee Valley authority (TVA) system. By and large, however, they regarded falling farm prices as their biggest vote-getting issue for 1956 and set about making the most of it.

In an almost straight party vote, Democrats forced through the house a bill restoring high, rigid price supports on basic field crops, a program congress had abandoned previously in favour of flexible supports at President Eisenhower's urging.

The Democrats made Secretary of Agriculture Ezra Taft Benson a prime target for their attacks. Benson and other Republican officials said the drop in farm prices was a result of the "inherited mess" of crop surpluses built up under Democratic rigid price props.

Despite Democratic concentration on farm belt woes, Republicans paeanned a theme of "peace-prosperity-progress." They pointed to booming business, rising wages and corporate incomes, a fairly stable price level and increasing employment. In this, the Republicans felt, they had the makings of a 1956 victory. Toward the end of the year they began to boast that many voters who once thought the Democrats the most likely party to bring good times were coming around to the belief that the

G.O.P. offered better prosperity insurance.

Republicans worked hard on organization. They assembled their 48 state chairmen for a campaign school in Washington, D.C., and flew them to Denver for a breakfast where Eisenhower uttered some prophetic words to the effect that "humans are frail—and they are mortal." He urged the party not to become dependent on one man, words remembered sharply a few weeks later when he was stricken with a heart attack.

The G.O.P. earlier had chosen San Francisco as the site for its 1956 convention in compliance with Eisenhower's wishes. Although its scheduled four-day meeting there, beginning Aug. 20, had been arranged on the obvious basis that Eisenhower would be the nominee, there was no move to lengthen the sessions when his entry became doubtful.

Democrats had picked Chicago and an Aug. 13 date to start a convention their leaders were striving months in advance to make as harmonious as possible. Democratic National Chairman Paul M. Butler sought to smooth over the loyalty oath controversy which had split the 1948 and 1952 conventions.

Butler said the party was willing to take back into the fold any penitents among 1952 general election bolters. Gov. Allan Shivers of Texas, who supported Eisenhower in that year, said that whether his state backed the party nominee in 1956 would depend on "the issues, the platform and the nominee." He made it clear he was against Stevenson. However, Speaker Rayburn spearheaded a Texas "loyalist" movement aimed at wresting the state party machinery away from Shivers and aligning it with the national ticket.

Sen. Barry Goldwater of Arizona, chairman of the Republican senatorial campaign committee, charged that union leaders were planning "massive use of political slush funds." He said the union merger would put too much political power in one man's hands. Union leaders vigorously denied these charges as they did a suggestion by Senator Knowland that they were trying to "capture" the Democratic party, make it over in the image of the British Labour party and win control of the government by 1960 at the latest. (See also ELECTIONS, U.S.; SOCIALISM; UNITED STATES.) (J. L. BE.)

Political Science. In 1955 there was continued progress in the internationalization of political science with dominant emphasis in the fields of international politics and administration, comparative government and political behaviour. The Third World congress of the International Political Science association was held in Stockholm, Swed., at the end of August and the subjects discussed were "Political Implications of Development Programs," "Small and Large States in International Organization," "The Government of Great Cities," "The Role of Party Systems in Democracy," "The Role of Public Opinion Polls in the Study of Political Parties" and "Relations Between Social Classes and Political Parties." The movement toward extending knowledge in the theory and practice of public administration was also advanced in a number of ways. For example, the first general course at the Advanced School of Public Administration for Central America got under way in 1955 at San José, Costa Rica, a project jointly maintained by the governments of five Central American countries and the United Nations; the United Nations, in co-operation with the government of Egypt, also established a public administration training centre at Cairo, Egypt; and the Foreign Operations administration of the U.S. government created administration training centres in a number of countries, among them Iran, Pakistan and South Vietnam. One of the major problems of the so-called underdeveloped countries is the management of state enterprises. Following the successful Rangoon conference of the United Nations on this subject in 1954,

the International Institute of Administrative Sciences in co-operation with the Royal Institute of Public Administration held a conference at Oxford, Eng., the two subjects discussed being "Common Elements in the Management of Business and Public Institutions" and "Increased Efficiency of State Economic Enterprises."

Another field of political science which had shown marked growth in recent years and where international collaboration was the rule was that of public opinion research. An example of this was the annual conference of the World Association for Public Opinion Research held at Konstanz, Ger., in Sept. 1955.

In the United States there were a number of interesting developments. One of these was a trend toward the establishment of joint courses in business and public administration where the effort was to elucidate the common organization and managerial elements in both areas and to focus on problems of policy formation and decision making. In 1955 there were several developments in this direction, one of them being the elevation of Cornell university's school of business and public administration to full graduate status.

A second trend, which began shortly after World War II, was the rapid growth of interest in political behaviour, this being part of a larger emphasis on the behavioural sciences sponsored primarily by the Ford foundation and the Social Science Research council. A number of seminars and training centres relating to political behaviour cropped up in 1955, an example being a faculty seminar at the University of Pennsylvania on "Research in Political Behavior: Its Achievements, Problems, Prospects," which met five times during the 1955 academic year. This was an interuniversity experiment attended by about 30 faculty members representing 10 different disciplines. The major purposes of the seminar were to provide an interdisciplinary forum for the discussion of fundamental issues which arise when behavioural research is discussed, and to identify, analyze and evaluate the major types of behavioural research both within and outside of the field of political science.

In the United States, as in other countries, the recent period for professional political scientists had been a time of intensive re-examination and self-analysis, as to both scope and content. This was illustrated, for example, in the report of Northwestern university's comprehensive survey of political science methodology as published in the *American Political Science Review* for March 1955. There was a new ferment in the subject, as well as a judicious review of past methods. According to this survey, there were no less than five areas in which modern methodologies had led to intensified or somewhat original forms of activity. The first of these was studies relying on "gross [unrefined] quantitative data" in such areas as legislative personnel, voting in legislative assemblies and other centres of interest in government and politics. The second category also relied on quantitative data but the items of evidence were more precisely defined and more severely judged before acceptance and the analysis to which they were subjected was more sophisticated. The third type, which appeared to be increasingly attractive, was the intensive examination of a process, event or series of occurrences, such as the full circumstances surrounding the passing of an important law. The fourth area, where the method was not new but the sophistication was notable, was the field of political biography. The fifth concentrate, although not given a name by the authors of the survey, had to do with a dynamic realism in describing the political process. The overall trend in the United States, said the authors of the survey, was a transition from the political scientists' main preoccupation with the historical-legal approach to what might be described as an empirico-descriptive approach.

In short, to return to the world view, the year 1955 saw a

continuation of the growth of international collaboration combined with the development of new groups and subgroups on political science in which the dominant emphases were on international politics, comparative public and private administration, comparative government, political behaviour and interdisciplinary co-operation. (M. E. Dk.)

Polo. The Triple C team from Detroit, Mich., carried off the United States open championship by defeating the Brandywine four of Kennett Square, Pa., in the final of the 1955 tourney played on Oak Brook's International field at Hinsdale, Ill., on Sept. 11. Scoring six times in the last two chukkers, the team of Don Beveridge, Bill Linfoot, Billy Barry and Harold Barry erased a 7-3 deficit to triumph 9-8. By their victory they gained permanent possession of the 45-year-old trophy, biggest prize in American polo. R. Williams, Ray Harrington, Clarence (Buddy) Coombs and Bill Mayer rode for the losing side. Meadow Brook of Westbury, L.I., took the Paul Butler national handicap title at Hinsdale on Sept. 18 by halting Oak Brook, 13-6. Hugo Dalmar, Pete Bostwick, Alan Corey, Jr., and Devcreux Milburn made up the winning quartet. A Triple C four successfully defended the national 20-goal crown, turning back the Milwaukee Polo club, 6-4, in the title game at Milwaukee, Wis. A Farmington (Conn.) team retained 12-goal honours by subduing the Blind Brook Polo club, 8-5, at Harrison, N.Y.

Indoors, the Squadron A team of Phil Brady, Jack Ivory and George Sherman captured national senior laurels by beating the New York Athletic club trio of Archie Young, Herb Pennell and John Pflug, 11-8, in the deciding contest of a three-game series at the Squadron A armory in New York. New York A.C. took the opening contest, 13-7, then Squadron A squared the series at 1-1 by winning the second game, 8-4. The national 12-goal title fell to the New York A.C. team of Fred Rice, Pennell and Zenas Colt when they defeated Squadron A, 14-12. A Huntington (L.I.) team of Ray Koch, Vince Rizzo and Joe Rizzo triumphed in the Sherman Memorial tourney by topping a New York trio, 12-11. The New Haven Polo club won the first Parsells Memorial event and Squadron A took New York league honours.

Cornell captured the national intercollegiate championship tourney by turning back Yale, 19-5, in the final at Squadron A armory. (T. V. H.)

Portugal. A republic of southwestern Europe, forming part of the Iberian peninsula, Portugal is bounded east and north by Spain. Area: 35,529 sq.mi., including Azores (890 sq.mi.) and Madeira (308 sq.mi.). Pop.: (1950 census) 8,510,240, including Azores (318,558) and Madeira (269,769); (1955 est.) 8,771,000. Language: Portuguese. Religion: Roman Catholic. Chief towns (pop., 1950 census): Lisbon (cap.) 783,226; Oporto 281,406; Setubal 44,235; Coimbra 41,977; Vila Nova de Gaia 38,003; Funchal (Madeira) 37,035. President of the republic in 1955, Gen. Francisco Higinio Craveiro Lopes; prime minister, Antonio de Oliveira Salazar.

History.—The financial year 1954 closed with a surplus of 52,500,000 escudos on a total revenue of 6,735,600,000 escudos. For the same year the balance of payments showed a credit of 1,387,000,000 escudos, which was about 697,000,000 escudos less than in 1953, notwithstanding expanding foreign trade returns

and more favourable terms of trade. For 1955 a budget surplus of 3,800,000 escudos was estimated on a total revenue of 7,334,500,000 escudos.

The national development plan was revised in the light of the first two years' experience: provision was made for a net increase in expenditure of 1,242,600,000 escudos for the four-year period ending 1958; 944,000,000 escudos of this was earmarked for home and overseas electrification schemes. It was estimated that reduced rates following the change-over from thermal to hydroelectric power generation had resulted in an economy amounting already to more than 12,000,000,000 escudos in charges paid by consumers. Rates in the Lisbon district were 40% lower than before World War II. The Sorraia valley scheme, a multiple purpose hydroelectric project involving, initially, the construction of two dams about 150 km. northeast of Lisbon, was reported to have made rapid progress. In addition to providing two power stations with a combined output of 16,500,000 kw.hr. a year, this scheme would ultimately permit the irrigation of more than 27,000 ha. of hitherto barren land in the Sorraia valley and in the Vila Franca de Xira area, where it was planned to produce crops of rice, wheat, maize and animal pastures.

A Portuguese delegation led by José Frederico Ulrich, president of the Nuclear Energy board, attended the international conference at Geneva on the peaceful uses of atomic energy. It was announced that Portugal's main lines of development in the field of nuclear energy would be: (1) prospecting for radioactive minerals in the national territory, home and overseas; (2) the use of radioisotopes in medicine; and (3) building and equipping atomic power plants.

With the arrival in August at Lisbon of a new motor ship, the "Niassa," Portugal's ten-year plan for the postwar renewal of its merchant fleet was completed. The plan involved the expenditure of about 4,000,000,000 escudos: more than 60 new ships had been built, some in Portuguese shipyards but the majority abroad. The creation of the new merchant fleet, comprising more than 200 vessels of a total dead weight of nearly 600,000 tons, represented an immense economic effort.

A number of measures including the supply of prefabricated buildings as well as some ambulatory schools and libraries, were taken to provide increased educational facilities in remote country districts. (F. B. H.)

See Oswald Blackston, *Portuguese Panorama* (London, 1955); Honor Wyatt, *The Young Traveller in Portugal* (London, 1955).

Education.—Schools (1952-53): primary 14,176, pupils 931,946, teachers 17,597; secondary 345, pupils 54,370, teachers (in the 44 state schools only) 1,196; vocational (1953) 204, pupils 35,170. Teachers' training colleges (1952-53) 16, students 2,042. Colleges of music and fine arts: 6, students 2,214, teachers 113. Universities (1953) 4, students 14,131, professors and lecturers 755.

Finance and Banking.—Monetary unit: escudo, with an official selling rate of 28.95 escudos to the U.S. dollar. Budget (1954 est.): revenue (ordinary) 5,328,000,000 escudos; expenditure (ordinary) 5,179,000,000 escudos. Internal debt (1953) 10,440,600,000 escudos; external debt 6,799,800,000 escudos. Currency circulation: (Dec. 1954) 9,800,000,000 escudos; (July 1955) 9,650,000,000 escudos. Bank deposits: (Dec. 1954) 124,180,000,000 escudos; (July 1955) 24,600,000,000 escudos. Gold reserves (Aug. 1955): 425,000,000 U.S. dollars.

Foreign Trade.—(1954) Imports 10,141,000,000 escudos; exports 7,295,000,000 escudos. Main sources of imports: dependencies 19%; continental European Payments union countries 42%; U.K. 15%; U.S. and Canada 9%. Main destinations of exports: dependencies 28%; continental E.P.U. 25%; U.K. 15%; U.S. and Canada 11%. Main exports: cork 20%; fish 11%; wine 2%.

Transport and Communications.—Roads (1953) 28,819 km. Motor vehicles in use (1953): cars 74,084; commercial vehicles 27,700. Railways (1954): 3,614 km.; passenger-

km. (1953) 1,574,000,000; goods, ton-km. (1954) 685,200,000. Shipping: merchant vessels of 100 gross tons and over (July 1954) 335; total tonnage 571,023. Telephones (Jan. 1954): 208,143. Radio receiving sets (Dec. 1953): 397,850.

Agriculture.—Main crops (metric tons, 1954): wheat 748,000; barley 104,000; oats 126,000; maize 387,000; rye 190,000; rice 144,000; potatoes 1,034,000; dry beans 28,000; broad beans 49,000; olives 283,000; olive oil 43,000. Wine production (1954-55): 1,128,000 metric tons. Meat production (metric tons, 1954): 85,000. Livestock (Dec. 1952): cattle 973,000; sheep 3,948,000; pigs 1,253,000; horses 85,000; mules 123,000; asses 245,500; goats 1,244,000. Timber (1953, metric tons): 4,400; raw cork (1952) 150,000. Fisheries (catch landed, including Azores and Madeira, 1953): 296,325 metric tons.

Industry.—Fuel and power (1954): coal 431,900 metric tons; lignite 65,140 metric tons; manufactured gas 56,010,000 cu.m.; electricity 1,639,000,000 kw.hr. Raw materials (metal content, metric tons, 1953): tungsten 2,939; manganese 5,300; lead 1,640; pyrites (production) 651,000; tin concentrates (metal content, 1954) 1,200; superphosphates (1952) 328,000; gold (1953) 462 kg. Manufactured goods (metric tons, 1954): cotton yarn 40,200; woven cotton fabrics 32,760; cement 784,300.

Portuguese Overseas Territories. Under this heading are grouped the Portuguese possessions in Africa and Asia. Their total area is approximately 803,835 sq.mi. and the total population (1950 census) 11,863,548. Areas, populations, capital towns and governors of the territories are given in the table.

History.—Changes in the constitutional status of the overseas territories came into force on Aug. 1, 1955. Angola, Mozambique and the state of India were all granted new statutes providing, among other things, for the establishment of legislative councils, composed of 23 members, 18 of whom are elected and 5 nominated by the provincial governor. These bodies have power to approve or reject measures proposed by the governor and to introduce bills themselves. They replace the former purely consultative *conselhos do governo*. Their resolutions cannot be overruled either by the governor or by Lisbon except on the grounds that they do not accord with the constitution of the republic. In the other provinces, where the new statutes do not provide for legislative councils, the existing *conselhos do governo* are given "closer contact with the respective Governors, to assist them in their functions."

Disturbances in the Indian territories of Gôa, Damão and Diu on Aug. 15 (India's Independence day) were on a much larger scale than in previous years. The number of lives lost was never precisely established: it was variously reported at between 20 and 30, with many more injured, when the Portuguese opened fire on groups of *satyagrahis*, so-called "peaceful demonstrators," who had marched across the frontier in defiance of orders to stop. These casualties gave rise to high feelings and some public disorder within India itself: Premier Jawaharlal Nehru was accused of having obliquely encouraged the demonstrators' marches into Portuguese territory while at the same time purporting to disapprove of them. In the beginning of September the Indian government declared that *satyagraha* to "liberate" Gôa was no longer desirable, and steps were taken to disperse the volunteers encamped at numbers of points along the border. At the same time Nehru reaffirmed India's determination not to

PORTUGUESE BORDER GUARDS beating Indian passive resistance demonstrators who made "peaceful marches" into Diu in Aug. 1955, according to the Indian source of the photograph

tolerate the presence of the Portuguese in Gôa, even if the Gôans themselves wanted them. As Lisbon remained equally intransigent the deadlock persisted. The closing of the Portuguese legation in Delhi and of all consular services on both sides of the frontier, demanded by India, produced a complete rupture of diplomatic relations.

(See also INDIA.)

Celebrations which had been planned for mid-November in Macao to mark the fourth centenary of Portuguese occupation were cancelled in consequence of a Peking declaration toward the end of October that Macao belonged to China; Portugal thus seemed to be facing the imminent prospect of another delicate situation in its overseas territories.

In Angola and Mozambique new institutes were established for scientific and medical research. The Limpopo railway connecting the Mozambique port of Lourenço Marques with Southern Rhodesia was inaugurated. Oil prospectors in Angola, about 30 km. from the city of Luanda, reported successful results from experimental wells.

Angola.—Schools (1953): primary 1,030, pupils 51,407, teachers 1,598; secondary 21, pupils 2,582, teachers 189; vocational 164, pupils 4,276, teachers 1,185. Teacher training colleges 2, students 121, teachers 10. Principal products (metric tons, 1953; 1954 in parentheses): sugar (*tel quel*) 52,000 (52,000); coffee 75,000 (60,000); broad beans (exports) 20,159; sisal (exports) 30,579; palm kernels (exports) 11,600 (9,200); cottonseed 11,000 (13,000); palm oil (exports) 6,683; diamonds 729,400 metric carats; maize (1951) 135,000 metric tons. Foreign trade (1954): imports 2,753,884,000 escudos; exports 2,957,436,000 escudos. Roads (1953): 35,800 km.; motor vehicles (1953): 19,795. Railways (1953): 2,477 km. Shipping (1953): vessels entered 3,943, of which Portuguese 3,169; total gross tonnage 4,515,401. Budget (1955 est.): ordinary revenue 1,324,630,626 escudos, extraordinary revenue 397,500 escudos; ordinary expenditure 1,125,750,626 escudos, extraordinary expenditure 596,380,000 escudos. Monetary unit: angular, at par with the escudo. (Escudo valued at 3.478 cents U.S.)

Cape Verde Islands.—Schools (1953): primary 119, pupils 6,167, teachers 149; secondary 1, pupils 637, teachers 20. Principal products: castor oil, coffee, mustard, brandy, oranges and hides. Foreign trade (1953): imports 271,849,000 escudos, exports 292,583,000 escudos. Shipping (1953): vessels entered 4,032; gross tonnage 6,527,755. Roads (1953): 545 km. Budget (1955 est.): balanced at 40,692,290 escudos (ordinary) and 21,600,000 escudos (extraordinary).

Guinea.—Schools (1952): primary 63, pupils 3,287; secondary 1, pupils 121; vocational 2, pupils 80. Principal products (metric tons, 1953): palm kernels 13,000; peanuts (exports) 2,600. Foreign trade (1951): imports 162,100,000 escudos, exports 143,600,000 escudos. Shipping (1953): vessels entered 83; gross tonnage 186,483. Budget (1955 est.): balanced at 97,004,310 escudos (ordinary) and 37,350,000 escudos (extraordinary).

São Tomé and Príncipe Islands.—Schools (1952): primary 18, pupils 2,558; secondary 1, pupils 43; vocational 1, pupils 93. Principal products (exports, metric tons, 1953): palm kernels 6,479; cocoa beans 10,883; copra 4,932. Foreign trade (1953): imports 117,470,000 escudos, exports 246,471,000 escudos. Shipping (1952): vessels entered 2,098; net tonnage 582,734. Budget (1955 est.): balanced at 50,308,671 escudos (ordinary) and 35,500,000 escudos (extraordinary).

Mozambique.—Schools (1953): primary 1,574, pupils 198,609, teachers 2,008; secondary (state and state-aided only) 6, pupils 956, teachers 100; vocational 67, pupils 5,925, teachers (1952) 185; teachers' training colleges 4, students 341, teachers 18. Principal products (metric tons, 1953): bananas 18,000; copra (exports) 24,400; sugar (1954, *tel quel*) 113,000; cotton, lint (1954) 35,000; cottonseed (1954) 69,000. Foreign trade (1953): imports 2,288,070,000 escudos, exports 1,619,757,000

escudos. Shipping (1953): vessels entered 3,274; gross tonnage 10,095,517. Roads (1953): 37,171 km.

India.—Schools (1952): primary 162, pupils 29,743, teachers (in the 162 state schools only, 1953) 264; secondary (state, 1953) 4, with 944 pupils and 29 teachers, (private, 1952) 64 with 13,172 pupils; vocational (1952) 9, pupils 568. Teachers' training college (1953) 1, students 28, teachers 4. University college (1953), students 159, teaching staff 20. Copra production (1953) 2,000 metric tons. Foreign trade (1951): imports 87,170,000 rupees, exports 25,930,000 rupees. Shipping (1953): vessels entered 258; gross tonnage 1,663,301. Roads (1953): 720 km. Budget (1955 est.): ordinary revenue 149,075,222 escudos, extraordinary revenue 76,345,250 escudos; extraordinary expenditure 76,345,250 escudos. Monetary unit: rupee=5.97 escudos.

Macao.—Schools (1952): rudimentary 89, pupils 17,947; primary 11, pupils 2,113; secondary 5, pupils 587; vocational 1, pupils 107. Foreign trade (1950): imports 171,900,000 patacas, exports 13,100,000 patacas; imports (1951) 344,300,000 patacas. Shipping (1950): vessels entered 13,679; net tonnage 4,922,437. Budget (1955 est.): balanced at 93,191,354 escudos (ordinary) and 22,000,000 escudos (extraordinary). Monetary unit: pataca=5.70 escudos.

Timor.—Schools (1953): primary 132, pupils 6,292, teachers 208; secondary 3, pupils 107, teachers 10; vocational (1952) 2, pupils 36. Foreign trade (1953): imports 63,562,000 escudos; exports 52,119,000 escudos. Roads (1953): 2,127 km. Shipping (1953): vessels entered 679; gross tonnage 137,640. Principal products (exports, metric tons, 1953): copra 1,191; coffee 1,381.

United States.—On June 10, 1955, the president signed into law the Postal Field Service Compensation act, which, he stated, represented the greatest forward step for the country's postal employees in more than a century. This act raised by an average of 8.1% the salaries of the 500,000 postal employees, including 15,000 in the Washington area. The annual increases provided in the law averaged about \$320.

Revenues of the post office department for the fiscal year ended June 30, 1955, amounted to \$2,349,476,528 and expenditures to \$2,712,150,122, resulting in a gross operating deficit of \$362,673,594. Efforts of the postmaster general to obtain from congress postal rate increases on first-class mail from three to four cents an ounce and on air-mail from six to seven cents an ounce failed.

On June 30, 1955, U.S. treasury savings stamps were on sale at approximately 17,000 post offices. Sales from July 1, 1954, to June 30, 1955, amounted to \$16,697,641.90. During the year U.S. savings bonds with a sale value of \$47,629,331.25 were sold in behalf of the treasury department. At the close of the fiscal year 1955, bonds were on sale at 5,560 post offices.

Through the 36,316 post offices, the 4,439 postal stations conducted under contract agreement and the 2,652 classified stations and branches, 55,195,500,000 pieces of mail matter were received for domestic mails and foreign destinations, transported and delivered during the fiscal year ended June 30, 1955. This mail had a total weight of 10,841,225,000 lb., an increase of 2,982,300,000 pieces but a decrease of 167,415,000 lb. from the preceding year.

On June 30, 1955, there were 171,000 mi. of domestic air-mail routes in the United States. Following intensive traffic and cost studies, the post office department initiated in 1953 air service on a space available basis for three-cent first-class mail between New York, Washington and Chicago. This proved so successful that the experimental "air lift" by 1955 provided direct service through 24 major and local service air lines to about 200 U.S. cities in 33 states.

During the 1955 fiscal year rural route service was available to more patrons than ever before. Approximately 38,000,000 persons, comprising an estimated 9,570,986 families, were served by 32,076 rural free delivery routes covering 1,544,704 mi. each week day. These figures represented a reduction of 294 in the number of rural routes from the year preceding, but an increase of 17,415 in route mileage; also an increase in the number of families served estimated at 135,965, or more than 500,000 persons.

Parcel post revenues for the September quarter of the 1955 fiscal year reflected increases in rates over the comparable quar-

ter of the preceding year ranging from three to six cents for domestic packages of one pound or less, depending on the distance sent. The increases on each additional pound ranged from two to four cents, also varying with the distance. The additional revenue from these rate increases amounted to about \$34,400,000. This was offset, however, by a reduction of approximately \$19,800,000 which resulted from a decrease in parcel post volume, leaving a net increase in parcel post revenue of \$14,600,000. Also during the 1955 fiscal year, added gross revenue from other domestic mail rate increases, including box rents, amounted to approximately \$5,506,000.

At the close of the fiscal year ended June 30, 1955, there were 2,711,110 depositors in the postal savings system, as compared with 2,934,795 on June 30, 1954, a decrease of 223,685, or 7.7%. The outstanding principal to the credit of depositors at the close of the year was \$2,007,996,458, a decrease of \$243,422,779, or 10.8%. In addition there were accrued interest obligations amounting to \$95,466,479.86, making a total liability to depositors of \$2,103,462,937.86.

During the 1955 fiscal year the post office department operated 3,174 government-owned buildings.

A new position of assistant postmaster general for personnel was approved by congress in 1953. Subsequently a bureau of personnel was established by the postmaster general, and for the first time in history responsibility for the department's 500,000 employees was centralized in one office.

During the 1955 fiscal year a complete revision of the postal manual was undertaken by the department. Chapters 1 and 2 of a new postal manual containing all the information needed by the public regarding domestic and international mail was issued in condensed loose-leaf form. A loose-leaf directory of post offices and a directory of international mail were published which had previously been issued in bound form. A publication entitled *Post Offices by Counties*, which contains an alphabetical list of post offices arranged by counties within the various

states, was published.

On June 30, 1955, 14 regional headquarters offices had been established, at Cincinnati, O.; Chicago, Ill.; Dallas, Tex.; Portland, Ore.; Minneapolis, Minn.; St. Louis, Mo.; Washington, D.C.; Philadelphia, Pa.; San Francisco, Calif.; Boston, Mass.; New York, N.Y.; Atlanta, Ga.; Denver, Colo.; and Memphis, Tenn. This decentralization of management was expected to provide operating economies, prompt action on necessary changes and better administration, because decisions would be made by those personally familiar with local conditions. Policy making and over-all direction would be the function of the Washington staff.

(I. Gg.)

Canada.—Many improvements were made during 1954-55 to meet current expansion. Gross postal revenue reached an all-time peak of \$151,717,273 from business transacted at 12,318 post offices; expenditures totalled \$144,013,279, compared with \$132,363,594 the previous year; 46,902,959 money orders were sold to the value of \$690,824,786, increases respectively of 2.4% and 2.2%.

There were increases in domestic and international first-class mail rates and an extension of "drop" letter rates to rural routes. Air-mail service for articles other than letters, postcards and parcels was extended to countries in Europe, Asia and Australasia and to South Africa, and air parcel post was extended to five additional lands. Parcel post agreements were signed with South Africa and the U.S.S.R.

There were 3,335,000,000 mail items of all classes handled by the post office, a 6% gain. There were 189 projects for new post offices or additions to existing ones in the planning stage, 28 post office buildings were completed and 47 were under construction.

Two more towns received full letter carrier service, and there were 123 letter carrier walks established throughout Canada servicing about 88,000 families.

Projects undertaken included the installation of a transorma electric sorting unit at Peterborough, Ont., the development of a model electronic mail-sorting machine at Ottawa and the purchase of 500 specially designed stamp-vending machines. About 1,200 postmasters of the smaller offices with some assistants became eligible for superannuation. (See also AVIATION, CIVIL; PHILATELY.)

Potash: see MINERAL AND METAL PRODUCTION AND PRICES.

Potatoes. The white (Irish) potato crop of the U.S. was again in 1955 a problem crop. Production of 383,771,000 bu., 8% more than 1954 but 4% below average, was nevertheless about 30,000,000 bu. in excess of probable market requirements. The 1,444,000 ac. for harvest was a modest 2.5% expansion over 1954, stimulated, perhaps, by buoyant spring markets, and far below the average for the previous decade of 1,967,000 ac.; nevertheless, it did not show the reduction of 5% to 15% from 1954 which had been recommended by the U.S. department of agriculture. The yield was 265.8 bu. per acre, as compared with 252.8 bu. in 1954 and 213.1 bu. per acre average 1944-53.

Generally favourable weather and advancing technology were major factors in the high yields; size and quality were generally good.

Prices were highly erratic, but extraordinarily high in the late spring of 1955, rising by as much as 200% as a freeze damaged the early crop in the southeast, then broke very sharply as the early, intermediate and late crops were harvested progressively. In October, producers received an average of 72.3 cents per bushel, as compared with 93.8 cents per bushel a year earlier. Representatives of potato growers urged that culls plus

"WELL, WHATA-YA KNOW, ONE FOR ME," a 1955 cartoon by Fitzpatrick of the St. Louis Post-Dispatch (Mo.)

U.S. Potato Production by Leading States
(In thousands of bushels)

State	Indicated 1955	1954	Average, 1944-53
Late crop			
Maine	65,875	48,960	61,758
Idaho	50,000	40,800	41,758
New York	29,760	31,560	33,341
California	18,170	15,410	14,195
Washington	16,365	13,200	10,595
Colorado	15,945	17,600	18,126
Oregon	14,295	13,200	11,613
Minnesota	14,056	16,605	15,190
North Dakota	13,720	20,600	19,958
Pennsylvania	13,395	14,500	18,568
Wisconsin	10,905	11,610	12,358
Michigan	8,270	9,800	14,252

Tennessee	1,236	1,425	2,366
South Carolina	1,102	1,595	1,979

20% of all potatoes grading U.S. no. 2 or better be withheld from the market.

The U.S. department of agriculture in September activated a diversion program under which growers received supplementary payments for 1955-crop potatoes diverted to starch, flour or feed. By early October, producing areas approved included all of Maine, Oregon, Washington and Colorado, plus some sections of California and Idaho. Payment was 50 cents per hundred-weight through December; 40 cents January through March, and 30 cents April through June, but only in areas that submitted satisfactory marketing plans for moving their crop.

The Commodity Exchange administration of the U.S. department of agriculture suspended the several potato traders who defaulted on 128,000,000 lb. of May futures contract potatoes on the New York Mercantile exchange.

The important potato crop of western Europe was indicated as generally smaller than in 1954 or normal. The Canadian crop was a large one and prices were much depressed.

Sweet Potatoes.—The U.S. 1955 sweet potato crop was indicated at 36,101,000 bu., 20% above the 29,880,000 bu. of 1954 but 23% below the average crop of 46,951,000 bu. Harvested acreage was only 339,000 ac., 2% less than 1954 but very small by comparison with the 496,000 ac. average for 1944-53. Yields averaged 106.6 bu. per acre, as compared with 86.5 bu. in 1954 and an average for 1944-53 of 94.3 bu. Louisiana with 9,800,000 bu. was the leading producer, followed by North Carolina (4,500,000 bu.), and Virginia (3,045,000 bu.). Average price to producers in October was \$1.44 per bushel as compared with \$1.84 per bushel in October 1954.

Presbyterian Church. Eleven church organizations in the United States bear the name "Presbyterian" in their official titles. The total number of congregations in the 11 branches of Presbyterian churches approximated 15,000 in 1955, with a communicant membership numbering about 3,850,000. Membership was concentrated in three branches: 237,233 in the United Presbyterian Church, 784,050 in the Presbyterian Church in the United States and 2,658,903 in the Presbyterian Church in the United States of America. The combined membership of these three, totalling 3,680,186, comprised 96% of the total of the 11 groups of Presbyterians.

The major effort at union among Presbyterians was projected in 1949 when the three above-mentioned organizations entered into a period of negotiation. A plan of union was formulated and approved in 1954 by the general assemblies of the three organizations. The plan was submitted to the presbyteries for their approval or rejection. The presbyteries of the United Presbyterian Church and of the Presbyterian Church in the U.S.A. approved the plan; but an opposition element in the Presbyterian Church in the U.S. was able to have enough presbyteries vote against the plan to thwart the constitutional requirement for approval. Consequently this plan for a three-way union was defeated. In June 1955 the general assembly of the United Presbyterian Church created a permanent committee on interchurch relations to negotiate with a like committee of the Presbyterian Church in the U.S.A. "on a union of the two fellowships."

For co-operative purposes on a more extensive scale the reorganized Alliance of Reformed Churches Throughout the World Holding the Presbyterian Order (World Presbyterian alliance) met in its 17th general council at Princeton, N.J., July 27-Aug. 5, 1954. This council represented 42 nations with a church membership of more than 40,000,000. The alliance for functional purposes is divided according to areas rather than sections as formerly: namely, North America, Latin America, Europe, South Africa, Asia and Australasia. The North American Area council representing ten member churches in North America held its first meeting under the reorganization in Ottawa, Ont., Feb. 15-17, 1955. The member churches are: Associate Reformed Presbyterian, Evangelical and Reformed, Free Magyar Reformed, Presbyterian of Jamaica, Presbyterian in Canada, Presbyterian in the United States, Presbyterian in the United States of America, Reformed in America, United Church of Canada and United Presbyterian of North America. At the Ottawa meeting the intent was voiced of moving from a period of fellowship and discussion to one of "study and action" in the interest of "service around the world, the promotion and defense of religious and civil liberty, and a united witness."

Within the bounds of the United States the Presbyterian churches were confronted with a growing demand for new church buildings created by the rapid growth of population in both urban and rural districts. Through contributions of members, funds were secured to purchase land and to construct places of worship. The Presbyterian Church in the U.S.A. made building aid appropriations during 1954 to the amount of \$2,355,984. Outstanding loans exceeded \$6,000,000 and mortgage grants surpassed \$9,000,000. A survey throughout this branch of the church estimated a need for 204 new churches before 1958 involving building aid to the extent of \$5,500,000.

Presidents, Sovereigns and Rulers.

The following is a list of the names of those holding chief positions in their countries as of Dec. 31, 1955:

Country	Name and Office	Accession
Afghanistan	Mohammed Zahir Shah, King	1933
	Mohammed Daud Khan, Prime Minister	1953
Albania	Haxhi Leshi, Chairman of the Presidium of the People's Assembly	1953
	Col.-Gen. Mehmet Shehu, Chairman of the Council of Ministers	1954
Anglo-Egyptian Sudan	Sir Knox Helm, Governor General	1953
	Ismail el-Azhari, Prime Minister	1954
Argentina	Gen. Pedro Aramburu, Acting President	1953
Australia	Field Marshal Sir William Slim, Governor General	1953
	Robert Gordon Menzies, Prime Minister	1949
Austria	Theodor Kröner, President	1955
	Julius Raab, Chancellor	1953
Belgium	Baudouin I, King	1951
	Achille van Acker, Prime Minister	1955
Bolivia	Victor Paz Estenssoro, President	1955
Brazil	Nereu Ramos, Acting President	1955

Country	Name and Office	Accession	Country	Name and Office	Accession
Bulgaria	Georgi Damianov, Chairman of the Presidium	1950	Poland	Aleksander Zawadzki, Chairman of the Council of State	1952
Burma	Vulko Chervenkov, Chairman of the Council of Ministers	1950		Josef Cyrankiewicz, Chairman of the Council of Ministers	1954
	Ba U, President	1952	Portugal	Gen. Francisco Higino Craveiro Lopes, President	1951
	Nu, Prime Minister	1948		Antonio de Oliveira Salazar, President, Council of Ministers	1932
Cambodia	Naradom Suramarit, King	1955		(Prime Minister)	
	Naradom Sihanouk, Premier	1955	Rhodesia and Nyasaland, Federation of	Lord Llewellyn, Governor General	1953
Canada	Vincent Massey, Governor General	1952		Viscount Malvern, Prime Minister	1953
	Louis Stephen St. Laurent, Prime Minister	1948	Rumania	Petru Groza, Chairman of the Presidium of the Grand National Assembly	1952
Ceylon	Sir Oliver Goonetilleke, Governor General	1954		Chivu Stoica, Chairman of the Council of Ministers	1955
	Sir John Kotelawala, Prime Minister	1953	Salvador, El	Lieut. Col. Oscar Osorio, President	1950
Chile	Gen. Carlos Ibañez del Campo, President	1952	Saudi Arabia	Sa'd ibn Abd ul-Aziz al Saud, King	1953
China	Chiang Kai-shek, President of the National Government	1943		Amir Faisal, Prime Minister	1934
	O. K. Yui, Prime Minister	1954	South Africa	Ernest George Jansen, Governor General	1951
China, People's Republic of	Mao Tse-tung, Chairman of the Central People's Government Council	1949		J. G. Strijdom, Prime Minister	1954
	Chou En-lai, Chairman of the State Administrative Council	1949	Spain	Gen. Francisco Franco Bahamonde, Chief of State	
Colombia	Lieut. Gen. Gustavo Rojas Pinilla, President	1953		(President of the Council of Ministers)	1939

Panamá	Ricardo Arias Espinosa, President	1955			
Paraguay	Gen. Alfredo Stroessner, President	1954			
Peru	Gen. Manuel A. Odría, President	1950			
Philippines, Rep. of the	Ramón Magsaysay, President	1953			

Prices. The United States in 1955 experienced the same stability of prices which characterized the four previous years. Both wholesale and consumer prices fluctuated within extremely narrow limits as the nation enjoyed one of the most prosperous years in its history. National income tended to run \$15,000,000,000, or approximately 5%, above that of 1954; compensation of employees also was roughly \$9,000,000,000 in excess of the preceding year; and corporate profits before taxes reached in the second quarter of 1955 a level approximately a third higher than the low point in 1954. With this increase in the main factors determining the demand for consumers' and investment goods was associated a corresponding increase in production, so that prices for the year, as a whole, showed a remarkable degree of stability.

This continued stability of prices is illustrated in Table I. On the basis of the index 1947-49=100, wholesale prices declined from 1951 to 1953 by a little more than 4%, and fluctuated within the following two years within a small fraction of 1%. Consumers' prices showed a steady rise after 1951, but the curve was flattening out and by the middle of 1954 had begun to level off.

Although the monthly average of consumer prices in the first nine months of 1955 was slightly below the average for 1954, the chart (on page 567) shows that this result was achieved by a decline of the index in the second half of 1954. In the winter and spring of 1955 the consumers' price index reached its lowest

Table I.—Wholesale and Consumers' Price Indexes, United States, Selected Years
(1947-49=100)

Year	Wholesale prices	Consumers' prices	Year	Wholesale prices	Consumers' prices
1929	61.9	73.3	1948	104.4	102.8
1933	42.8	55.3	1949	99.2	101.8

level, and in the late spring and summer of 1955 it began to rise again. Though the price increase was not sharp, it continued steadily, and some concern was expressed over potentially inflationary tendencies in the United States economy.

In spite of the sizable increase in disposable personal income (*i.e.*, income of households and single individuals after withholdings of direct taxes) personal savings did not increase. Whereas, for example, in the second quarter of 1954 disposable personal income amounted to \$253,900,000,000, annual rate, and personal savings to \$18,800,000,000, annual rate, the corresponding figures for the second quarter of 1955 were \$267,100,000,000 and \$16,600,000,000. In other words, whereas disposable personal income on an annual rate increased by \$13,200,000,000, personal savings decreased by \$2,200,000,000. This means that a total of \$15,400,000,000 more spendable funds appeared on the market in 1955 than in 1954.

Another sign of the inflationary potential in the U.S. economy was the large increase in consumer credit. Whereas in Aug. 1954 the total of outstanding consumer credit amounted to \$28,700,000,000, it amounted in Aug. 1955 to \$33,600,000,000, an increase of almost \$5,000,000,000 or approximately 17%. Most of this increase was in automobile loans, but other forms of consumer credit were included. (*See also* CONSUMER CREDIT.)

The sustained level of purchases of consumer durables and the increase in instalment credit during 1955 provoked a series of measures designed to keep in check any inflationary tendencies that might develop. One such measure was an increase in discount rates in Aug. and Sept. 1955 from 2% to 2½% in most Federal Reserve districts and again in November to 2¾%. This action was followed by an increase in commercial bank rates and the rates charged by most major finance companies. In Oct. 1955 the large New York banks raised their rates for prime

paper to 3½%, the highest rate in 25 years. All these measures contributed to some extent to the maintenance of stable consumers' prices, in spite of the large increase of spendable funds. (*See also* FEDERAL RESERVE SYSTEM.)

But although measures of credit restriction were partly successful in maintaining stable prices, two other factors must be cited which counteracted the pressure on prices exerted by the high level of expenditures on consumers' durables. One was the restraint of the federal government, which curtailed its expenditures as much as possible, and the other was the continued decline in agricultural prices and the resulting low level of food prices. Table II shows that the retail price index of food, which in Aug. 1954 had stood at almost 114, dropped by Jan. 1955 to 110.6 and maintained itself around 111 for the remainder of the year. Table III shows that wholesale prices of farm products, and consequently wholesale prices of processed foods, declined steadily and almost without a break from the middle of 1954 throughout 1955.

Whereas during the second half of 1954 and the first half of 1955 the over-all wholesale price index fluctuated somewhat erratically around a level congruent with that reached and maintained in the previous two years, it showed a rising trend beginning with June 1955. Wholesale prices in Sept. 1955 were higher than during any other month since Sept. 1952 and an examination of the price trends of certain industrial classes showed that they evinced signs of reaching and perhaps even surpassing the peaks of 1951.

In fact, the trend of industrial wholesale prices was strongly upward in 1955, and the index was maintained at a relatively stable level only because of the decline in prices of farm products and commodities directly processed from farm products, such as foods, hides and skins, and the commodities in the mis-

cellaneous column (which consist in large part of animal feeds). Wholesale prices of textile products, chemicals, tobacco manufactures and bottled beverages, as well as fuel, power and lighting materials, remained fairly stable throughout 1954 and 1955. Lumber, wood products, pulp, paper and furniture—all products made of timber—showed a moderate price increase which, however, was large enough to bring the prices of these commodities to a level matching the highest postwar level ever reached. Metal and metal products industries, as well as rubber and its products, showed sharp price rises throughout 1955.

If a comparison is made of the wholesale price indexes for Sept. 1955 in the various commodity groups with the month representing the highest index ever reached in the postwar period, it is found that in 7 out of 15 commodity groups wholesale prices were lower than those reached in the peak month (usually in 1951 or 1952), and that in 8 groups—rubber, lumber, pulp and paper, metals, machinery, furniture, nonmetallic minerals and tobacco and beverages—wholesale prices were higher than ever before. In some commodity groups, notably in the rubber, minerals, metals and metal products classes, prices were rising rapidly in 1955. Wholesale prices of rubber, for example, rose by 19.5% in the period from Sept. 1954 to Sept. 1955, and wholesale prices of metals by 10.6% in the same period.

As against the sharply rising wholesale prices of some industrial commodities, farm prices remained stable and even fell in the same period. This means that the "parity ratio" (*i.e.*, the ratio between prices received by farmers to prices paid by them for goods and services, the latter including interest, taxes and wage rates) continued to decline in 1955. Whereas in 1951 the monthly average of the parity ratio had been 107, it had declined by 1952 to 100, and fell further in 1953 to 92, in 1954 to 89 and in the first nine months of 1955 to 86. This decline in farm prices was one of the chief reasons for the fall in farm incomes in 1955 as compared with previous years. The problem of farm prices, farm price maintenance and farm incomes thus became one of the acute economic problems of the year.

The decline of farm prices and of farm incomes might have had more serious effects if the number of farm operators had remained constant. But with the fall in farm prices and the simultaneous increase in agricultural output was associated a decline in the farm population. Hence average production per person engaged in agriculture was in 1955 about one-third larger than in the 1947–49 period; and although aggregate farm income had declined by about 16% since the peak year of 1951, farmers' incomes on a per capita basis dropped in the same period by less than 10%. On the whole, the decline in the number of farm operators and improvement of agricultural productivity, partly as a result of greater use of power machinery and equipment and partly as a result of more rational choice of crops, prevented a more drastic decline in the income of the average farm family,

in spite of sharply falling prices of agricultural products.

Prices of farm real estate remained strong throughout 1955, however, despite the steady decline in farm commodity prices and farm incomes in the last four years. Average value per acre of farm land had been increasing since 1953, and the value of farm land and buildings in mid-1955 was close to the peak reached in 1952. At the same time farm debt outstanding had risen by about 10% since 1954. These were signs that farmers had tended to adjust to the new price relations between farm and nonfarm commodities by extending their land holdings (resulting in a rise of real-estate values) and by increasing their short-term and mortgage indebtedness to counteract, to some degree, the decline in real income, which was felt by many to be only temporary. Although these trends tended to make farmers more vulnerable, the maintenance of a prosperous economy and the improvement of export markets for U.S. farm products were felt to be the best insurance against the farm situation's developing in a catastrophic direction. (B. F. H.)

Great Britain.—The fortunes of the sterling area depending a great deal on the prices of a few basic commodities, experience in 1955 was rather mixed. Tin prices were generally steady or rising within the range £700–£750 a ton, and rubber prices rose rapidly to a peak of 3s. 6d. a pound in September (double the price at the same month in the previous year) but fell back toward the end of the year.

Against this, wool and cocoa prices fell off during the year and their effect was more serious. Crossbred types of wool, largely from New Zealand, were firm in price in 1954 and fell relatively little in 1955. The main price declines were in the better (merino) qualities from Australia. At the new season's auctions late in 1954 merino wool prices were 15% or more below those of the previous season, and another similar fall occurred in the auctions late in 1955. Two successive falls of this amount had

serious repercussions on the Australian economy. Australian spending on imported goods in 1954-55 was related more to the higher prices of wool of the previous year than to the lower receipts from current and prospective wool sales. Import cuts were imposed late in 1955, but before this Australian outgoings of dollars and other currencies were at a high rate. This was a factor influencing the loss of gold and dollar reserves of the sterling area, and the weakness of the sterling exchange rate, which developed by the middle of 1955.

British wholesale prices were rising slowly but steadily during 1955; this was true of import prices, of prices of industrial materials and of prices of industrial products both for the domestic market and for export. In the middle of the year there were increases of 7½% in rail freights, of 18% in pit head prices of coal and of about 5% in steel prices, all being reflected in firmer prices of industrial products by the end of the year. There was a temporary and sharp rise in the price of imports at the beginning of 1955 (because of high tea, cocoa and coffee prices) and an equally temporary worsening in the terms of trade. Apart from this, levels of import prices and of export prices were alike 2%-3% higher in 1955 than in 1954 and the terms of trade were almost unchanged.

Retail prices in 1955 were generally about 4% above the levels of the previous year. The rises were concentrated on the prices of foods, fuels and service items; retail prices of manufactured goods were still absorbing increases in costs, though there were signs that this was not likely to continue.

Other Countries.—The general level of wholesale prices was little changed from 1953-54 to 1955 in Canada and Switzerland and only slightly higher in Belgium. The more usual experience, however, was that prices over a wide range of goods at wholesale were rather higher in 1955. This was so not only in Great Britain but in the German Federal Republic, the Netherlands, Sweden and other industrial countries. These increases were attributable not so much to higher costs of materials as to the common tendency for wages to rise more than productivity and for consequent increases in fuel prices and freight rates.

The question was much discussed in 1955 whether increasing costs were reducing the power of Great Britain to compete in export markets relative to the German Federal Republic and other European countries, and whether all European industrial exporters were losing ground relative to the United States. The test lay in the levels at which prices of manufactured goods could be sold, shown in Table VII. The general inference from the different index numbers, though by no means perfectly comparable, was that, at least for most of 1955, the leading industrial countries were able to absorb increased costs equally well. Export prices rose more in Great Britain and Germany than in the United States in the period 1950-52. Following the devaluation of 1949, British and western German exporters had a price advantage over their competitors in North America; they used up this advantage in raising their prices during the Korean war boom. After 1953 export prices in both countries were rather lower and rising quite slowly. However, it was still uncertain late in 1955 whether British export prices could absorb the large wage increases of the early months of the year, increases which were on a larger scale than those in the German Federal Republic or the United States. (See also AGRICULTURE; BANKING; BUILDING AND CONSTRUCTION INDUSTRY; BUSINESS REVIEW; INCOME AND PRODUCT, U.S.; STOCKS AND BONDS; WAGES AND HOURS.) (R. G. D. A.)

Prince Edward Island. Smallest province of Canada (2,184 sq.mi.), Prince Edward Island lies in the Gulf of St. Lawrence. It joined the confederation in 1873. Pop.: (1951) 98,429, (official June 1, 1954, est.) 105,000. Capital: Charlottetown, pop. (1951) 15,689.

History.—After four stormy years, the provincial potato marketing board became a major issue in the summer of 1954, but a special plebiscite among the potato growers extended its life indefinitely. The board continued during 1955 as the selling agency and licensed dealers were relegated to an assembling and shipping role. The fisheries division of the provincial department of industry and natural resources continued measures to modernize the fishing industry and lead it away from too-full dependence on the lobster market. The provincial government's industrial loan policy continued to attract new industries (evaporated milk, potato chip, fish filleting, vegetable canning), and assist the tourist trade, farming and rural electrification.

The leader of the Liberal party and premier of the province during 1955 was A. W. Matheson.

Education.—Latest available statistics for provincially controlled primary and secondary schools were for the 1953-54 school year, when 766 teachers taught 19,933 pupils who had an average attendance of 16,905. Revenues for such schools totalled \$2,126,974.06.

Public Health and Welfare.—For the year ending March 31, 1954, the federal government paid out \$2,591,882 in family allowances on behalf of 35,812 children; \$3,264,400 in old-age security pensions to 6,804 pensioners; \$199,452,018 in old-age assistance payments to 612 recipients and \$41,081,050 in pensions to 95 blind persons. Mothers' allowances and families assisted as of March 31, 1955, totalled 237; children aided 611. Total benefits for year were \$73,250,000.

Transportation and Communications.—On March 31, 1955, there were 12,551 passenger cars using the 3,180 mi. of provincial roads of which 350 mi. were paved and 1,450 mi. standardized. On March 31, 1955, there were seven airports. During 1955 there were 13,790 telephones in use. On March 31, 1955 there were 22,000 radios in use.

Banking and Finance.—On Jan. 1, 1955, there were 24 branches of chartered banks doing business. Gross fund of debt was \$18,600,000 less sinking funds. Gross funds of debt \$3,740,426; net fund of debt \$24,859,574; unfund of debt \$2,974,147. Outstanding liabilities amounted to \$17,833,720 for the year ending March 31, 1955. There were 57 credit unions at the end of March 1954; loans made totalled \$870,052,088; assets \$1,187,656.

Agriculture.—During 1954 farm cash income averaged \$5,000,000 per quarter. Revised statistics did not go beyond 1951, when the wheat crop was valued at \$146,150; oat crop at \$3,425,400; barley \$153,400; potatoes \$11,011,200; hay \$4,776,000. In 1954 the island farms had 120,000 cattle; 77,000 swine; 39,400 sheep and lambs; 980,000 domestic fowl. Value of mixed grains was \$3,305,450.

Fisheries, Furs and Forestry.—During 1954 fisheries statistics showed 3,827,400 lb. of fish landed worth to the fisherman \$2,870,210, and with marketed value \$3,641,040. Irish moss; number of pounds gathered 11,528,200; value \$140,890; marketed value \$273,188. Island trappers brought in 6,000 pelts worth \$10,050.

Manufacturing.—Latest available statistics were for 1954, when 1,798 employees in 224 plants earned \$22,954 in salaries and wages. Finished products were as follows: butter and cheese \$3,793,000, fish processing \$3,220,589, prepared stock and poultry food \$1,238,344. (G. V. F.)

Printing. Most of the developments announced for the graphic arts industry during 1955 consisted of refinements of elements used either in actual printing operations or in fabricating the elements making up the printing plates. Automation as such, compared with general industry, made little progress during the year. A new fluorescent light-sensitive paper was announced. Through use of the specially prepared paper, staging and correcting colour plates for newspaper use were eliminated and separation prints of greater brilliance were secured. It is a plastic base paper with fluorescent coating over which is laid the silver emulsion and gelatin protective coating. The emulsion is developed and fixed in normal manner. For the fluorescent exposure, the camera screen is raised and special Kemart lights are used in place of regular arc lamps. This exposure varies from $2\frac{1}{2}$ to 3 min., which affects only the very light tones. (Harvey Holsapple, Kemart Corp., Minneapolis, Minn.)

One of the major problems of the converting section of the industry has been the restoring of moisture to the film or paper web after the web has passed through ink drying chambers in the printing press at speeds up to 500 f.p.m. A firm announced a steam conditioner cabinet at the end of the press or other processing equipment whereby moisture in correct amount is restored to the film or paper stock by means of steam jets which attack the web at all angles under pressure of 3 to 5 lb. per square inch. Automatic controls shut off the steam when the press is stopped and vice versa. Temperature within the steam unit is maintained at 190° F. (Worth Wade, American Viscose Corp., Philadelphia, Pa.)

Equipment and a method for photographing type lines or made-up page forms, or both, containing type matter, photoengravings and rules was developed. The equipment consists of a fixed focus camera with special frontal lighting equipment, spray booth, make-up table and complementary photographic developing equipment and materials. The first step is to spray the form with lampblack suspended in a solvent which evaporates immediately. The coating is wiped off the image or printing surface with a smooth rubber block and a specially sanded

rubber block to diffuse reflection from the printing surface. The form is then placed in vertical position on the copyboard. The light source, approximately four feet in diameter, consists of a number of Mazda light bulbs which, in rotating, produce an evenly distributed specular light on the form. The maximum photographed area is a 22-in. diameter circle. When the form is photographed the image is always positive. The camera is provided with two focal planes. The vertical position is used for black and white prints and positives used in making albenum process negatives. A plane mirror is used to laterally reverse the image. Positives made in horizontal position are used for deep-etch and rotogravure work. With these two positions the image can read right or wrong according to the process used. (Ludlow Typograph Co., Chicago, Ill.)

A letterpress cylinder printing press make-ready system was announced. After the form has been put on the press, a proof is taken on a plastic coated sheet. The freshly inked sheet is then taken to a special cabinet. During rotation the sheet passes under a bank of infrared lamps. Rays from the lamps penetrate through the still moist black ink and cause the image components to raise. The white plastic nonprinting areas do not accept the rays and consequently do not raise. The inked areas, however, do raise under the action of the infrared rays. The printed areas rise in the solids as much as 0.004 in. In the middletone and highlight areas, the images rise from zero to 0.003 in. After being treated, the now made-ready sheet is returned to the printing press cylinder and fastened in the cylinder packing. Thus the printing areas in the form receive greater or less pressure in printing. The solid areas, of course, in letterpress printing, require more printing pressure than the lighter areas. (Minnesota Mining & Mfg. Co., St. Paul, Minn.)

The matching of colour in the printing industry, especially with respect to reproduction of original art work, has always been a problem. A solution in the handling of the same reproduction by the different people involved was claimed by the introduction of a specially constructed lamp outfit. The equipment is used for examining, checking and matching colours through emittance of the various light rays necessary to produce an approximation of blue sky sunlight. This is done by using specially processed fluorescent-type lamps, each of which produces intrinsically one of the colours, except red, that compose the daylight spectrum. Red of adequate quality is supplied by special incandescent lamps in combination with the fluorescent-type lamps. Luminous efficiency of the unit is said to be high since it contains no filters and the heat factor is correspondingly low. (L. Court Butler, White Plains, N.Y.)

Other minor but important developments were announced. One of these was a dimensionally stable material, called Wellite, for mounting photoengravings in place of the usual wood base, which is unstable material. Its development was credited to Battelle Memorial institute, a Columbus, O., research organization. The blocking consists of asbestos with inorganic binders moulded into sheet form under pressure. It is further treated by grinding for uniform thickness and surface smoothness. A thermoplastic resin coating for bonding engraving to base is applied to one surface of the base. (Wells Mfg. Co., South Bend, Ind.)

A lightweight curved printing plate was announced. It consists of a perforated aluminum saddle, a layer of Vinyl plastic and a thin electrotpe. The light weight of the plate greatly reduces the effect of centrifugal force during the printing operation. While being treated, the sandwich is compressed approximately 0.006 in. to permit the plastic to enter the perforations in the saddle while the plastic and the electrotpe are bonded to produce, in effect, a one-piece curved printing plate. (Printing Plate Supply Co., Chicago, Ill.) (M. St.)

Prisons. The year 1955 was one of continued crises in the nation's prisons. Between January and September, 20 riots occurred in ten state prisons and reformatories, one state hospital for the criminally insane and two county jails. Besides the considerable property damage resulting from these disturbances, many guards were held hostage, several prisoners seriously injured and, in one of the jail riots, one prisoner was killed.

Within a period of several months, six riots occurred in the Nebraska penal system. Two riots, five weeks apart, broke out behind the walls of the Washington State prison. Rebellions erupted also in the Massachusetts State prison, the Texas State prison, the Ionia State reformatory in Michigan, the Wyoming State prison, the Nevada State prison, the Great Meadow Correctional institution in New York, the Rhode Island State prison, the Rusk State Hospital for the Criminally Insane in Texas, the State Prison camp in Greenville, N.C., the Nassau County jail on Long Island, and the Bexar County jail in Texas. In practically all instances, the usual investigations by citizen committees or legislative commissions followed, but without concrete results except a tightening of security measures and a good deal of acrimonious political debate.

Professional penologists and serious students of correctional administration had long recognized and pointed out the deep-seated and varied causes which underlie these destructive disturbances. The conditions which make these flare-ups of mass violence possible continued to be: overcrowding; untrained personnel; lack of classification of inmates; political meddling in prison administrations; inadequate parole systems; harsh and unfair treatment; idleness; and in most cases an almost total lack of rehabilitative programs.

Another problem which characterized the prison situation during the year was the accelerated increase in prison population. At the end of 1954, there were 182,051 persons serving sentences in state and federal prisons and reformatories for adult offenders, or an increase of 9,322 over those in prison at the close of 1953. Prisoners in state institutions numbered 162,048 at the end of 1954, an increase of 8,682 over the previous year. In federal institutions the year-end population rose to 20,003, an increase of 640. At the same time, the number of persons committed by the courts to both state and federal institutions

Sentenced Prisoners in U.S. Prisons and Reformatories
(Dec. 31 of each year)

Year	Federal institutions	State institutions	Total	Rate per 100,000 Population
1954	20,003	162,048	182,051	114.4
1953	19,363	153,366	172,729	110.6
1952	18,014	149,360	167,374	109.2
1951	17,395	147,501	164,896	109.1
1950	17,134	148,662	165,796	110.4
1949	16,868	146,474	163,342	110.7
1948	16,328	138,764	155,092	106.8
1947	17,146	133,719	150,865	105.8
1946	17,622	121,813	139,435	100.8
1945	18,638	114,581	133,219	104.4
1944	18,139	113,835	131,974	104.2

increased even more sharply. A total of 79,946 persons were sent to prison in 1954, as compared with 73,299 in 1953, an increase of more than 9%.

In the face of persistent prison riots and an evergrowing prison population, little significant legislation or concerted action was taken during the year toward the improvement of basic conditions or expansion of facilities.

The federal prison system too was not immune from the problem of overcrowding or the need for expanded facilities. Federal institutions were located in 19 states and the District of Columbia. These comprised 28 institutions, including 6 penitentiaries, 5 reformatories, 6 correctional institutions, 6 camps, a medical centre, a detention or jail facility, a youth centre for adolescent offenders, a training school and a forestry camp for juvenile delinquents. Designed for a normal capacity of 18,990, the federal prison system as of Sept. 8, 1955, had to cope with a total population of 19,913.

The rehabilitation program in the federal system included classification, casework services, medical and psychiatric treatment, education and vocational training, religious counselling, and an extensive program of employment and industrial production. The latter program was operated by Federal Prison Industries, Inc., a government-owned corporation, but administered as an integral part of the federal bureau of prisons. During the fiscal year, this industrial production program employed about 20% of the prison population and produced goods for sale to other government agencies valued at \$20,362,250. Out of the earnings, the corporation financed entirely the costs of the vocational training program, and during the fiscal year paid out to inmates employed in the shops \$1,185,978 in wages, which were sent to dependents or kept for the inmates in anti-

GUARDS RUSHING PRISONERS during a riot and fire at the Nebraska Men's reformatory, Lincoln, Sept. 9, 1955

pation of their release. In addition, the corporation had returned to the U.S. treasury over the past nine years in excess of \$28,500,000, in itself a substantial return to the taxpayer for the cost of operating the federal prisons. (See also CRIME.)

Protestant Episcopal Church. Statistics given by the *Episcopal Church Annual* at the beginning of 1955 showed moderate gains under all headings except parishes and postulants for the ministry. The total number of baptized members was 2,907,321, an increase of 116,386 over the previous year. The number of communicants, 1,816,611, represented an increase of 38,980. The decline in the number of parishes (a decrease of 87 to a total of 7,912) probably resulted from the closing of city churches in consequence of population shifts. There were 7,367 ordained clergy at the beginning of 1955, an increase of 134 over the previous year. The number of lay readers was 8,626, an increase of 876. The church schools had 678,935 pupils, an increase of 60,933, and 75,861 teachers, an increase of 4,765. Total receipts came to \$125,532,521.67, an increase of \$22,116,881.20.

There was an encouraging reversal of the previous decline in the number of baptisms. A total of 98,255 infants were baptized, an increase of 19,148. Adult baptisms came to 19,044, an increase of 4,092. The number of confirmations was 104,014, an increase of 9,414. The ratio of clergy to communicants was the same, in round numbers 1 to 246, but if fractions were taken into account, there was a slight decline. A total of 418 persons were ordained to the diaconate, an increase of 15, and 388 to the priesthood, an increase of 21. There were 666 candidates for the ministry, an increase of 9. The number of postulants (those preparing to become candidates) was 1,195, a decrease of 9.

The general convention met in Honolulu, T.H., in September, convening outside the continental United States for the first time in history. It voted a record budget of \$6,807,947 for the general church program and rejected a recurrent proposal to omit the adjective "Protestant" from the name of the church. It received reports on the organization of theological seminaries in the dioceses of Long Island and Kentucky. The Long Island institution was designed to specialize in the training of older men, coming to the ministry from other callings. Plans were announced for the removal, in 1956, of the church archives, in the custody of the Church Historical society, from Philadelphia, Pa., to Austin, Tex., where space was to be provided for them in the library of the Episcopal Theological Seminary of the Southwest.

Psychiatry. The steadily increasing population of mental hospitals in the United States and the high incidence of neurotic and character disturbances led the president's commission for the study of the nation's health to declare in 1955 that emotional disabilities represented the nation's foremost health problem.

Estimates of the extent of mental illness in its milder, less

incapacitating forms varied because of the difficulty in drawing a sharp line between mental health and the milder forms of emotional disturbance. Hospital statistics, however, showed that in 1955 a total of between 700,000 and 750,000 hospital beds, or one of every two in the United States, were filled by mental patients, and although 16,000 new patients were being admitted each year, many mental hospitals had long waiting lists. In the last 50 years, as the nation's population had doubled, the mental hospital population had quadrupled.

The relative increase in mental illness was less attributable to increased tensions of modern life than might at first appear. At least part of the increase in numbers of patients resulted from the relative increase in numbers of elderly and consequently more vulnerable people, and part from the greater understanding and acceptance of emotional illness by the public and the consequent greater acceptance of the advisability of hospitalizing relatives when it becomes necessary. Furthermore, sociological changes in family structure and mobility had complicated the problem of keeping mentally ill patients at home. In many areas, however, as patient loads had increased modern treatment methods had not been applied, usually as a result of inadequate hospital staffing which in turn was a product of limited budgets and limited trained personnel. Funds and professional staff were often not available for intensive application of occupational, physical and the so-called physiological therapies, for the development of a therapeutic milieu within the hospital geared to the specific needs of the individual patient or for careful professional planning for rehabilitation, particularly in the transitional period immediately following discharge from the hospital. These methods require an initial increase in expense, and additional money was hard to obtain.

However, in areas where human and financial resources had been mobilized to carry out modern treatment and rehabilitation methods, the results were gratifying, and although initially more expensive, in the long run they represented financial as well as human economy.

A more spectacular approach to the problem of treatment resulted from the use of new medications. Chlorpromazine, reserpine and several newer drugs were tested on a wide scale during the year. Although many reports in the medical and public press continued to be enthusiastic about their value, and although some of these drugs possess a definite tranquillizing effect, most observers continued to be conservative in their expectations and concerned about complications, particularly with the synthetic compounds. There is sufficient variation among individual patients in response to these drugs to make their use inadvisable except under careful medical observation.

During the year, studies of individual differences of reaction to narcotic and other drugs gave promise of leading to a better understanding of susceptibility to drug addiction and perhaps to alcoholism. It was believed that these investigations might help psychiatrists to predict the effects of treatment more accurately and consequently to prescribe more specifically.

In other areas, co-ordinated psychological and physiological studies sought to establish a more comprehensive background for the study of psychiatry. Refined techniques of investigation of the electrical activity of the brain made possible more thorough evaluation of brain function in mental illnesses. With these techniques the effects of psychological stimuli on brain physiology could be more clearly demonstrated. To some extent the improvements in technical methods had resulted in increased interest in the temporal lobe of the brain, whereas previous investigations of psychological function were more concerned with the frontal lobe. Seizure patterns originating in the temporal lobe were implicated as contributing to the cause of some varieties of impulsive antisocial behaviour.

The cause, treatment and legal status of homosexuality continued to be subjects of major concern to psychiatry. Although the evidence in favour of psychological rather than endocrine causative factors continued to accumulate, treatment methods were still prolonged, cumbersome and generally unsatisfactory. Psychiatrists continued to search for better treatment methods, and at the same time sought to clarify and find better solutions for the somewhat chaotic laws affecting sexual deviants.

Finally, a few overdue words were spoken during the year in recognition of adolescents as individuals with personality strength and potentialities for positive development. The apprehension about rising delinquency rates had led to the categorization of all adolescents as potential delinquents who require restraint, without discriminating between those whose backgrounds predispose them to delinquency and those whose struggles to establish their own independent identities may be safely permitted latitude. Since children tend to respond to the expectations of their parents, the general expectation of delinquent behaviour in adolescents may in itself be a factor in its production. (See also CHEMOTHERAPY; PSYCHOLOGY; PSYCHOSOMATIC MEDICINE.) (C. K. A.)

Psychology. Psychology can be viewed as a pure science concerned with investigations of the behaviour and experience of organisms, especially the human organism, but, as do almost all other sciences, psychology has its applied or technological aspects concerned with application of scientific findings to practical human problems in industry, the school, the clinic, etc. During 1955 problems of professionalization and of maintaining standards of competence among persons offering psychological services to the public continued to preoccupy many psychologists and psychological organizations. On the other hand, basic technological research productivity continued to expand, a trend that had been especially marked since the end of World War II. In the course of the year, the *Psychological Abstracts* listed more than 8,000 titles of papers in technical journals and books on psychological topics published throughout the world. Some of the significant directions and trends of progress in basic principles and applications will be noted.

The study of perception, of how the individual becomes aware of the world around him through his senses, is a problem that has long interested psychologists. In recent years there has been much interest in the influence of motivation, *i.e.*, of interests and needs, of a person on his perceptions. Some studies seemed to imply that basic sensory capacities are modified by the motivations of the observer while other studies found them to have little effect on perception. On the basis of researches during 1955, it appeared that motivations are important in selective aspects of perception. From an array of potential stimulus objects that are in the environment, the individual is most likely to "see" (to respond to) those items that are relevant to his motivational state. Also, wishes often determine what the person "sees" when the stimuli are unclear or are inadequately presented to the sense organs. The evidence shows that motivation has little if any effect on fundamental sensory capacities when the latter are measured adequately.

The capacity of organisms to modify their behaviour in terms of consequences of that behaviour, the capacity to acquire new knowledge, in short, to learn, is a phenomenon of central psychological interest. Studies on learning are particularly concerned with testing a number of competing and conflicting theories regarding the fundamental nature of learning. A very considerable amount of research results during the year failed to show definitive support for any one of the various theories. Careful logical analysis of some of the theories of learning was

beginning to indicate that in the final analysis differences among learning theories might turn out to be more apparent than real. Psychologists had a body of solid empirical knowledge regarding simpler forms of learning, particularly of lower animals, but as yet they had not achieved an adequate theoretical formulation of the phenomena of learning.

Many would consider the topic of personality, its development and dynamics, to comprise the central problem of psychology. Because of its great complexity, the human personality is very difficult to grasp scientifically. There are many theoretical approaches to its study. A glance at articles in scientific journals and books published during the year showed that European (continental) psychologists on the whole took a more phenomenological, philosophic and speculative approach to the study of personality while the majority of psychological studies from England and America were more likely to be empirical, objective and concerned with statistical treatment of data, including factor analysis. An important development in the field of personality study was the publication and subsequent influence of W. Stephenson's book, *The Study of Behavior*. The book sets forth Q-technique, as it is called by Stephenson, which is a procedure of factor analysis of correlations between persons rather than between tests, which is the more traditional approach. It becomes possible to do objective and quantitative statistical analysis of interrelations and patterns of traits, even of a single person. An important application of Q-technique appeared in the publication by the staff of the counselling centre at The University of Chicago of their long-term study of personality changes of persons undergoing client-centred psychotherapy. Their work was pioneering in its attempt to study objectively and scientifically the influence of psychotherapy on personality.

Psychological testing consists of trying to assess or evaluate major aspects of behaviour such as abilities, aptitudes or personality characteristics on the basis of a small sample of behaviour obtained in a more or less standardized fashion; *i.e.*, with a test. In order to develop valid tests, psychologists must first have some estimate of the psychological characteristics they wish to measure against which to check the validity of their tests. This is called the criterion. For measures of basic abilities and skills, the criterion problem was easily solved and psychological testing is most effective in those areas. But the criterion problem is extremely difficult to solve when one attempts to measure personality traits and the complex personal characteristics which must be evaluated in order to make tests, for example, to select salesmen or business executives or to measure ability for leadership. Much research and many tests of these complex personality attributes which are used in industry and the clinic are in great need of improvement by means of checks against more adequate criterion behaviour. An important trend in 1955 was a growing awareness of the need for serious concern for the criterion problem in work on assessment of human characteristics. Some systematic investigations of the criterion problem were reported. More studies were needed.

Physiological mechanisms underlying psychological and behavioural phenomena represent an important problem investigated not only by psychologists but by related disciplines such as neurophysiology. A significant event of the year was the Wisconsin symposium on "Interdisciplinary Research in the Behavioral, Biological and Biochemical Sciences" at which scientists from the several disciplines reported and discussed research findings on problems of the biological basis of behaviour. Among many significant topics discussed at the symposium was the behaviour correlated with functions of a region of the brain called the rhinencephalon. This area of the brain was so named

(the nose brain) because it was formerly believed to mediate olfactory sensations. In recent years evidence had been accumulating which suggested that parts of this phylogenetically ancient region of the brain function primarily as centres for emotional behaviour. Reports at the symposium confirmed and enlarged this interpretation of the function of the rhinencephalic structures.

Comparative or animal psychology continued to be an active field of research, likewise largely of interdisciplinary nature. Theoretical views of some of the German students of animal behaviour (ethologists) had stimulated much interest and several research projects in laboratories in England and America as well as in some continental laboratories. A phenomenon called "imprinting" (*Prägung*), which was described by the German ethologists, was carefully and quantitatively investigated. In some species of birds (mallard ducks were used) the first living thing, or even animated object, that the duckling sees during a critical period shortly after hatching becomes his parent in the eyes of the duckling. He follows the pseudoparent and in other ways behaves toward it as ducklings usually behave toward the mother duck on which, in the natural state, they are almost inevitably "imprinted." Whether or not such a behavioural mechanism, or phylogenetic vestigial remnants of it left behind in evolution, can be found in mammals, especially higher mammals, is an interesting problem which was being investigated. (See also PSYCHIATRY; PSYCHOSOMATIC MEDICINE.) (G. J. Ts.)

Psychosomatic Medicine. Psychosomatic medicine is a development in the practice of diagnosis and treatment which takes into account the composition of the human being as both a mind and a body and which relates various physical conditions to emotional backgrounds, thus recognizing both the mental and physical components. Psychosomatic medicine therefore emphasizes the interdependence of mental processes and physical or bodily functions.

During 1955 an outstanding study was presented by George L. Engel and Franz Reichsman demonstrating the relationship between feelings, relationships between people and gastric secretions. For many years it had been known that the behaviour of the stomach was related to feelings, and this in turn to relationships between people. Numerous theories had been developed regarding these relationships, and increasingly specific hypotheses had been formulated. Although it was known and physicians had based their treatment of patients on the fact that removal from tension and stress is beneficial to those suffering from disturbances of the stomach, it had not helped to achieve a sharper understanding of what brings about abnormal stomach activity.

The investigators reporting this work used a technique of investigation which made possible the observation of the function of the stomach in a living child from moment to moment and hour to hour during the daily life of this patient while in the hospital. This observation differed from many other types of investigative work that had been performed in that the changes that took place in the stomach were correlated with changes in the feelings of the child and the relationship it demonstrated to people in the natural course of events. This was in sharp contrast with many types of investigations in which attempts were made to bring the stomach to a base line and then to watch the change that took place when something was changed either in the patient or in his surroundings. Obviously, to bring the stomach to a base line may involve producing artificial situations which are not lifelike.

The patient studied was an infant who was born with a closure of the tube leading from the mouth to the stomach, which required, immediately after birth, the construction of an opening into the stomach through which the child could be fed. The

baby did not do well, and she was admitted to the hospital at the age of 16 months in a severely weakened and underweight condition. At this time investigations were begun. An experimental procedure was developed in which one of the physicians was thereafter in frequent attendance upon this little girl patient. He talked to her, fed her through the tube, took samples of juices from her stomach and became quite obviously, to anyone who would observe the reaction between the two, her "good friend." Thus it was possible for the "good friend" doctor to observe the child directly and to observe her reactions to others in the environment or to other medical procedures which were required.

At the same time, the second investigator was in an enclosed room from which he had complete vision of the child and the "good friend" doctor. He could hear everything that went on and yet could not be seen by the patient or her doctor, and thus was able to observe the total situation. After certain preliminary planning it was possible for these doctors to set up a series of criteria and to give names and values both to the various feelings that the child exhibited and to her relationships with other people, as well as a number of other behavioural characteristics. It was possible for them to define a number of different feelings that the child was experiencing, such as contentment, joy, irritation, rage and depression in terms of the posture, the movement, the facial expression and the vocalization of the child. Likewise, it was possible to define the degree of interest shown by the child in people or things, from one extreme of little or no interest to the other extreme of primary attention or vigorous participation. Having established these criteria, which were recognizable by others and therefore were similar to any accurate measuring scale, such as a ruler, they could relate this to the activity of the hydrochloric acid in the stomach and to other measures.

Since observations could be made on the activity of the stomach at the same time that records could be made of the feelings the child was exhibiting and the degree of its relationships with people, these could be correlated in a statistical manner. The results revealed that the correlations between these three different measures were intimately related one to the other. Since the stomach activity and the behaviour of the child were observed from moment to moment and hour to hour during the daily routine of the child, minimum disturbance was introduced into the situation. Observations could be made upon the child while it was sleeping, while it was being fed and while it was playing, and its reactions to "strangers" and to people who performed necessary cleansing and medical functions could be observed.

Several striking and important observations were recorded which verified and confirmed work done in other fields. The secretion of the hydrochloric acid in the stomach was intimately integrated into the total behaviour activity of this infant. Feeling states which were expressive of social communication, whether they were ones which were pleasurable or ones which were aggressive, were associated with rising rates of secretion of hydrochloric acid. If the child showed a feeling of depression, which was related also to a relative reduction in the degree and the rate of communication with things and people around the child, this was associated with a decrease or even a cessation of gastric secretion. The more active were the interactions of the child with the things and people around her, the more active was the rate of the secretion of hydrochloric acid in the stomach.

A particularly striking discovery was the finding that the injection of histamine—a powerful stimulant of secretion in the stomach—produced a completely different result depending upon who gave it to the child. When the histamine was injected into

the child (a standard laboratory process) by the "good friend" doctor, a copious flow of gastric juice resulted, actually giving the highest amounts recorded at any time. When the same dose of histamine was injected into the child by the "stranger" doctor (some physician that the child did not know but who might look very much like the "good friend" doctor), little or no secretion occurred. Actually, some of the amounts secreted were lower than the lowest amounts occurring during everyday events related to the depressive state.

This work was outstanding in its method and in its verification of many of the theories about people's inner feelings, their relationships with other people and the operations of the various organs. The results of these studies confirmed in many aspects hypotheses that had been derived from the study of the stomach alone by physiologists, from the study of adults by psychoanalysts and physiologists and from the observations of infants by pediatricians and by people interested in the importance of the early feeding relationship of the child and its mother.

The findings of this technique marked an important milestone in the search for more accurate and detailed understanding of the total operation of man. The study was an example of excellent psychosomatic research. (See also PSYCHIATRY.) (G. C. H.)

BIBLIOGRAPHY.—*Affects, Object Relations and Gastric Secretions: the Study of an Infant with a Gastric Fistula*, presented at the American Psychosomatic Society, Atlantic City, N.J., May 5, 1955, and at the American Psychoanalytic Association, Atlantic City, May 7, 1955.

Public Assistance: see CHILD WELFARE; SOCIAL SECURITY.

Public Health Engineering.

An important advance in organized air pollution activities was signified during 1955 by the enactment of federal legislation directed to the support of research and to the encouragement of co-operative state action in pollution abatement. The problem of ultimate disposal of highly radioactive wastes resulting from nuclear power plant operation assumed greater significance with the realization that general use of this power source might well depend upon the development of feasible waste disposal methods. Recommendations on national policy for the best use of the nation's water resources were prepared by several special federal commissions. The year was further marked by an aggravation of public health engineering problems in municipal fringe areas.

Community Air Pollution.—In response to the increasing nation-wide concern over air pollution, congress enacted the Air Pollution Control act, P.L. 159. This legislation focused support mainly on research by government and private agencies to develop knowledge which would be useful in abatement programs.

Research and control efforts in the field of air pollution were the subject of several scientific meetings sponsored by state governments, professional societies and the federal government. Research on the photochemistry of hydrocarbons furnished the basis for a "smog alert" system tried by local agencies in some areas. A national air sampling network, operated co-operatively by federal, state and local agencies in 30 representative U.S. cities, completed 18 months of sampling intended partly to obtain data on so-called "background" levels of air pollution. The average total particulate content of local atmosphere was found to be related to the size of the local population.

Radiological Health.—Public health problems introduced by nuclear power plant operations were emphasized following changes in the Atomic Energy Commission Enabling act to facilitate nonfederal operations in reactor development. Of overwhelming significance was the need for a practicable method for disposal of long-lived radioactive wastes. Among the methods

under study were disposal at sea and permanent storage underground or at protected sites in uninhabited areas. The Oak Ridge National laboratory reported satisfactory disposal of liquid waste containing approximately 0.003 curies of radioactivity per gallon by discharge to pits located in Conosauga shale. Realization that spent reactor fuel elements should be processed at specially selected sites rather than at the individual plant brought to the fore the problem of transportation of such materials.

Sewage and Waste Disposal.—The increased diversity of industrial wastes discharged to surface waters continued to be a major problem for water pollution control agencies. This problem was aggravated by the difficulties of fixing water quality requirements for important water uses. The principles underlying successful operation of sewage lagoons were the subject of joint studies by the public health service and the states of North and South Dakota. Growing interest in anaerobic processes for waste treatment followed their successful application to packing house wastes. Another event of widespread interest was the successful treatment of Kraft pulp and paper mill wastes by the activated sludge process. Problems of designing and financing sewage treatment plants for new housing subdivisions in outlying areas were studied by agencies concerned with future incorporation of such plants in metropolitan sewerage systems.

Water Supply.—Increased practice of supplemental irrigation in the eastern United States drew attention to the possibility that a major change was occurring in surface water use. A number of states were considering legislation establishing state control of allocation of water to specific users to replace the traditional doctrine of riparian rights. Provision of water service to new housing developments in outlying areas continued to be a major administrative problem for municipalities. Recognition of the value of the membrane filter technique for bacteriological examination of drinking water led to inclusion of this technique as a tentative method in the tenth edition of *Standard Methods for the Examination of Water, Sewage and Industrial Wastes*. The usefulness of the membrane filter was increased by the development of a delayed incubation procedure permitting transportation of the filter without affecting coliform organism count.

Milk and Food.—Research on the use of ionizing radiations in food preservation indicated that commercial application of this procedure was close at hand. In response to a need for improved sanitation in the poultry-processing industry, the public health service with the assistance of the states developed a poultry ordinance recommended for adoption by states and communities. Continued expansion in the use of automatic vending machines for perishable foods emphasized the need for a code of sanitary control that would effectively reach the machine operator as a food handler. Similarly, the increasing popularity of partially prepared and precooked frozen foods pointed to the need for more rigid sanitary controls in handling these food products.

Refuse Disposal.—Application of incinerator design practice to prevent air pollution was evident in Philadelphia, Pa., and in Washington, D.C., where equipment for effectively controlling fly ash was incorporated in large municipal installations. Small communities increasingly favoured the sanitary land fill as an economical and acceptable method of refuse disposal. Although interest in composting of refuse continued to be widespread, the need for improved mechanical techniques and the uncertain marketability of the product discouraged adoption of this disposal method.

Vector Control.—Resistance of insects to chlorinated hydrocarbon insecticides continued to be the most significant problem

encountered in vector control, despite the increased use of organophosphorus compounds in fly and mosquito abatement programs. Reports suggested the occurrence of resistance to DDT in eight species of *Anopheles* found in certain areas in Asia, Europe and South America. Resistance of *Anopheles quadrimaculatus*, the principal vector of malaria in the United States, to several chlorinated hydrocarbons was found for the first time in the U.S. in Bolivar county, Miss. Increased propagation of houseflies in privies following application of chlorinated hydrocarbons indicated that this practice should be discontinued until the factors responsible were clarified.

Industrial Hygiene.—Interest in noise control increased in proportion to the number of workmen's compensation claims involving alleged loss of hearing. Epidemiological studies were undertaken on the effects of various noise levels. Effective instrumentation for measuring impact noise was developed. The anticipated development of nuclear power reactors for civilian use confronted industrial hygienists with new problems of radiological safety. Research on the effects of microwaves on health was directed to radar detection devices, radar cooking devices and diathermy equipment. (See also ACCIDENTS; EPIDEMIOLOGY; PUBLIC HEALTH SERVICE, U.S.; WORLD HEALTH ORGANIZATION.) (B. B. BR.)

Public Health Service, U.S. The principal federal health agency, the public health service of the U.S. department of health, education and welfare, continued during 1955 its program of research, medical care for specially designated groups and technical assistance to state and local health agencies.

During the year the public health service played a major role in the testing and release of a new vaccine against paralytic poliomyelitis and in the development of a nation-wide voluntary program of distribution. A poliomyelitis surveillance unit was established to investigate all cases of the disease and to gather information relating to the safety and effectiveness of the vaccine. (See POLIOMYELITIS.)

The Nation's Health Record.—The general death rate in the United States in 1954 was 9.2 per 1,000 population. This was the seventh consecutive year that the death rate had been below 10 per 1,000.

The infant death rate was 26.6 per 1,000 live births, and the maternal death rate 5.3 per 10,000. The tuberculosis death rate dropped from 12.6 per 100,000 population in 1953 to 10.5 in 1954. The principal diseases of childhood, scarlet fever and streptococcal sore throat, diphtheria, whooping cough and measles, which caused about 15 deaths per 100,000 population in 1944, were responsible for about 2 deaths per 100,000 population in 1954.

Major cardiovascular diseases accounted for 53% of deaths in 1954, and malignant neoplasms for 16%.

Increases were reported in the number of cases of infectious encephalitis, infectious hepatitis, measles, poliomyelitis, scarlet fever and streptococcal sore throat, whooping cough and psittacosis. There was a marked reduction in cases of malaria.

There were an estimated 4,021,000 births and 1,476,000 marriages in 1954. (See also BIRTH STATISTICS; DEATH STATISTICS; INFANT MORTALITY.)

Research.—Research activities during the year included clinical trials of the antirheumatic drugs prednisone and prednisolone, which were found to be four times as potent and in some respects less hazardous than cortisone. The cancer chemotherapy program was accelerated and the pilot program for detection of cancer of the cervix, in Memphis, Tenn., completed its third year.

New evidence that diet can influence the development of den-

tal caries was discovered and further investigations of fluorides in drinking water showed that they have no effect on growth or calcium metabolism in the bones of young rats. Heart disease research was carried out on the use of the tranquillizing drug, reserpine, in hypertension and the effect of injections of heparin on the fat-clearing factor in the blood. A method for establishing blood flow rates to different parts of the brain was developed, and it was demonstrated that 12 amino acids, the building blocks of proteins, are essential to growth of cells in tissue culture.

An experimental vaccine for the adenoidal-pharyngeal-conjunctival viruses was developed and clinical trials on human volunteers begun. The deficiency of glutamic acid in the brain of epileptic patients was clearly demonstrated.

Medical Services.—The public health service continued to supply medical services to merchant seamen and other federal beneficiaries, and to assist other federal agencies in providing needed medical care. The service maintained 16 hospitals, including 2 for treatment of narcotic addiction, 1 for tuberculosis and 1 for the treatment of leprosy; 25 outpatient clinics and 96 outpatient offices. Added to the service's activities was complete responsibility for health services to American Indians.

The hospital survey and construction program was expanded to provide federal funds for construction of nursing homes, chronic disease hospitals, diagnostic and treatment centres and rehabilitation centres. By the end of the fiscal year, June 30, 1955, 28 state plans for construction of these facilities had been approved.

Under the original hospital construction program 2,514 projects had been approved by the end of the fiscal year, and when all were completed, 118,814 hospital beds, 547 health centres and 18 state health department laboratories would be added to the nation's health resources.

Services to the States.—Federal appropriations for grants-in-aid for state and local health services totalled \$21,263,000, a decrease of about 7% from the 1954 appropriation. Consultative and technical assistance was given to states and communities in health education, public health nursing, disease control and collection of vital statistics. During the year, congress authorized a \$500,000 fund for research and investigation in problems of air pollution.

Programs of interstate carrier sanitation and vessel inspection were continued. A model poultry ordinance was developed, and the first national conference on shellfish sanitation was held. Comprehensive water pollution control programs for river basins in half of the nation's area were developed.

Experimental studies proved that in guinea pigs tuberculosis can be completely prevented by giving isoniazid at the time of infection. A national study to involve ultimately 1,000 children was initiated to determine whether isoniazid would prevent tuberculosis meningitis and other complications.

Assistance was given 34 states, the District of Columbia, Alaska, the Virgin Islands and Puerto Rico in venereal disease case finding. A diabetes case-finding program was begun in Oxford, Mass., and a study made of 11 representative home-care programs.

The epidemic intelligence service aided 15 states in 18 epidemic situations and investigated 170 other outbreaks of disease.

In its international health activities, the service staffed health programs in 42 countries and aided 771 persons from 68 countries who came to the U.S. for additional training in 111 fields of health study. (See also EPIDEMIOLOGY; INDUSTRIAL HEALTH.)

Public Utilities.

With the continued levelling off in the applicable level of wages and prices in the United States there was a falling off in the number of rate increase cases before both state and federal commissions during 1955. This was true in particular of rates for water, electric and telephone service. However, the pressure for increases in the rates for natural gas service continued, reflecting in part increases in the price of natural gas at the producer end of pipelines transmitting such gas in interstate commerce.

Since the enactment of the Natural Gas act in 1938 and beginning with the Columbian Fuel corporation case of June 29, 1940, the Federal Power commission had uniformly held that it had been the intent of congress to restrict the jurisdiction of the commission to the transmission of gas at wholesale in interstate commerce and to prohibit the exercise of jurisdiction over the production and gathering of natural gas, as well as over the sale of such gas as incident thereto. In 1951 this question was presented to the commission once more in the Phillips Petroleum company case (10 F.P.C. 246). The commission again decided that the Phillips company was an independent producer of natural gas, that the sales involved were sales in interstate commerce for resale for ultimate public consumption but that such sales, though made after the completion of production and gathering, were incidental to such production and gathering and that, therefore, they were excluded from its jurisdiction under the Natural Gas act.

The states of Michigan and Wisconsin challenged this interpretation because the Michigan-Wisconsin Pipe Line company which serves retailing utilities in these states draws its supplies exclusively from the reserves available to Phillips Petroleum company. Upon final review of the commission's decision by the United States supreme court on June 7, 1954, in *Phillips Petroleum Company v. State of Wisconsin, et al.* (347 U.S. 672), that court held that the Federal Power commission must exercise jurisdiction over independent natural gas producers and gatherers such as the Phillips company. Pursuant to this mandate the commission issued orders prescribing regulations as to the filing of rate schedules and as to applications for certificates of convenience and necessity by producers and gatherers who sell gas in interstate commerce for resale. This order affected thousands of independent suppliers not hitherto subject to the act and gave rise to many suits at law challenging the validity of the order.

In the case of producing and gathering facilities owned by the pipeline companies themselves, the commission in its historic rate-making processes had included these facilities along with its other properties as a part of the net investment rate base upon which a reasonable return was allowed. Natural gas acquired for transportation from nonaffiliated independents had been included in the cost of service at higher contractual costs considered as "fair field prices" and presumably fixed at competitive levels. The Federal Power commission departed from this historic policy in deciding a case, *In the Matter of Panhandle Eastern Pipe Line Company* (3 P.U.R. 3d 396), on April 15, 1954. In pointing out that the use of the historic policy resulted in "indefensible discrimination" between the pipeline company and independent producers, the commission for the first time used the "fair field price" standard also upon the company's own production. This action was justified by the commission, in light of the decline in Panhandle's own production from 52.4% of sales in 1942 to 22.6% in 1952, by explaining that it was in the public interest that pipeline systems retain a substantial production of their own. This decision was in 1955 on appeal in a lower court.

These two distinct but related decisions raised the question of what was the proper fuel policy for the country to follow.

The commission was suggesting such a policy by supporting the Harris bill, favourably reported in the house, and the Fulbright bill to come before the senate in the next session of the congress. These bills, if enacted into law, would clear up the uncertainties through amendment of the Natural Gas act by making certain that the production of natural gas would not be subject to federal regulation as a public utility and that the pricing of natural gas supplies would take its cue from some "fair field price" obtaining in competitive fuel markets. Opposition to the proposed legislation was certain to be sectional and vigorous.

A significant change affecting the use of fissionable materials by public utilities was made by congress in a 1954 amendment of the Atomic Energy act of 1946. At the time of the earlier legislation it was deemed important to preserve the protection afforded by making such facilities and technological knowledge the property and monopoly respectively of the federal government. Private contractors had been used under a strict security system to assist in development of a weapons program. When the utilization of atomic power was no longer secret and the hope of securing complete international control faded, the question was raised whether maximum progress could be made under the government monopoly system.

In the belief that greater progress can be made through widespread participation in the development of atomic energy for peaceful purposes, congress decided that the strict controls of monopoly and of public ownership might be relaxed. The primary objective should be to reduce costs and thus make atomic energy economically feasible. Under the new dispensation private industry could own and operate production facilities such as the various types of reactors, but the government would continue to own what were termed "special nuclear materials." The Atomic Energy commission, however, was authorized to distribute the use of such materials to licensees, charging for the same to commercial users or distributing it free to those engaged in research and development. Under the 1946 act the government owned both fissionable materials and facilities.

Scientific and economic data remained restricted except that regulations provided for the freer flow of information, consistent with national security, in order to further industrial and scientific progress. By late 1955, 19 applications had been received by the Atomic Energy commission for the use of nuclear materials, of which applications by groups of utilities headed by Consolidated Edison company of New York, Commonwealth Edison company of Chicago, Detroit Edison company and Yankee Atomic Electric Power company were the most important. The Atomic Energy commission could also produce electric power at experimental facilities and was authorized to dispose of its surplus to public agencies, co-operatives and private utilities in high-cost power areas. The greatest barrier to private investment thus far stemmed from the nonavailability of insurance coverage.

(M. G. G.)

Canada.—The largest current project in 1955, the building of 2,500-mi. \$350,000,000 natural gas pipeline from the oil fields of Alberta to the consumer markets of eastern Canada, was bogged down by difficulties in raising the required capital. A solution seemed to be imminent whereby the federal government and the province of Ontario would advance the cost of building the large unprofitable link through the uninhabited parts from Manitoba to central Ontario. Meanwhile, however, Trans-Canada Pipe Lines had undertaken to build the 335-mi. line from Toronto to Montreal, with a spur to Ottawa, which, pending the arrival of gas from western Canada, would serve those territories with gas imported from the U.S.

Nine hundred miles were added in 1954 to the network of oil pipelines and 209,000,000 bbl. were shipped through against 160,000,000 bbl. in 1953. In the first eight months of 1955

throughput of 134,000,000 bbl. was again 20% ahead of the same 1954 period.

Canadian railways carried less freight and fewer passengers in 1954 than in the preceding year, and the two large companies experienced a drop in operating revenues—Canadian Pacific railway to \$461,000,000 against \$509,000,000 and Canadian National railways to \$641,000,000 from \$697,000,000. The trend was sharply reversed in 1955 when car loadings for the first ten months came to 3,396,000, up more than 11% from the previous year.

The power production of central electric stations rose from an average monthly rate of 5,457,000,000 kw. in 1953 to 5,761,000,000 kw. in 1954 and exceeded this rate by more than 11% during the first eight months of 1955.

The largest telephone utility, the Bell Telephone Company of Canada, added 167,000 telephones to its operation during 1954, bringing the total to 2,294,000. During 1955 the company was installing 39 relay stations as part of a transcontinental microwave radio relay system for coast-to-coast television service.

Canada's public utilities were planning to spend \$1,077,000,000 on capital account during 1955 as compared with \$1,114,000,000 in 1954.

Puerto Rico. A self-governing commonwealth in the West Indies voluntarily associated with the United States, Puerto Rico is the smallest and easternmost island of the four Greater Antilles, which together with the Lesser Antilles form a chain of about 200 islands beginning south of the tip of Florida and extending to the northeastern coast of Venezuela. Puerto Rico has an area of 3,435 sq.mi. Population (1950 census) 2,210,703; (July 1, 1955, estimate) 2,264,000. Chief cities (1950 census): San Juan, the capital, 224,767 (including Río Piedras, annexed in 1951, 357,205); Ponce, 99,492; Mayagüez, 58,944; Caguas, 33,759; and Arecibo, 28,659. Language: Spanish; English also taught in the schools.

History.—During the fiscal year 1954-55 two new important acts were enacted by the legislative assembly. One provided for the establishment of the Institute of Puerto Rico Culture and the other established the right of every person who is head of a family to possess and enjoy as a homestead a property of not more than \$1,500 in value. This act states that the right of homestead is unrenounceable and that no sale shall be made under a judgment or execution of any property when the same is claimed or occupied as a homestead.

In the same year a total of 781 trainees and visitors came to Puerto Rico through the Office of Technical Cooperation of the commonwealth department of state. Under this program, 2,374 trainees, visitors and observers came to Puerto Rico, from May 1950 to Aug. 1955, from 88 countries of the free world to make studies in different fields of interest, such as housing, community development, fiscal programs, public administration, budgeting, planning, personnel administration, hydroelectric development, health education and agricultural and industrial development.

The chief commonwealth officers for 1955 were: governor, Luis Muñoz Marín; secretary of state, Roberto Sánchez Vilella; secretary of justice, José Trias Monge; secretary of the treasury, Rafael Picó; secretary of education, Mariano Villaronga; secretary of labour, Fernando Sierra Berdecia; secretary of public works, Roberto Sánchez Vilella; secretary of health, Juan A. Pons; secretary of agriculture and commerce, Luis Rivera Santos; comptroller, Rafael de J. Cordero; head of the Institute of Cooperative Development, Ramón Colón Torres; chief justice

of the supreme court, A. Cecil Snyder; president of the senate, Samuel R. Quiñones; and speaker of the house of representatives, Ernesto Ramos Antonini.

Education.—Enrolment for the school year 1954-55 in public and private, day and night schools totalled 652,375, made up as follows: elementary, 467,814; secondary, 153,421; vocational, 1,579; and special classes for adults, 29,561. Of the total population 6-18 years of age, 73.4% was enrolled. Public and private day schools enrolled 571,029, while 81,346 were enrolled in night and vocational schools. The number of public school teachers was 11,537.

Resources available for public elementary and secondary schools, vocational education and rehabilitation and related services during 1954-55 were estimated as follows: from commonwealth sources, \$44,505,000; from federal sources, \$5,830,000; total, \$50,335,000.

The University of Puerto Rico enrolled more than 13,000 students. Other institutions of higher learning were: Polytechnic institute at San Germán, College of the Sacred Heart at Santurce, Catholic university at Ponce and Puerto Rico Junior college at Río Piedras.

Banking and Finance.—On June 30, 1955, the 13 banks and the various branches reported assets of \$414,325,000; total deposits, \$314,025,466; total bank loans, \$217,015,510; and bank debits, \$417,851,383.

The commonwealth government revenues related to central government purposes during the fiscal year 1954-55 totalled \$161,161,773, of which \$131,303,380 was received into the general fund; the balance went to special funds.

Total appropriations for central government purposes, from all funds, amounted to \$181,494,990, of which \$151,952,498 was general fund appropriations. The commonwealth government net debt as of June 30, 1955, was estimated at \$39,115,764. The net income of the Puerto Rican economy during fiscal year 1953-54 was estimated at \$961,400,000.

Trade.—During the year ended June 30, 1955, the value of all merchandise exported amounted to \$352,940,580, of which \$342,577,772 comprised shipments to the United States. The value of all merchandise imported amounted to \$574,539,870, of which \$524,282,343 represented shipments from the United States.

Communications.—As of June 30, 1955, a total of 105,413 motor vehicles was registered. Passable by motor vehicles, the urban mileage of streets was 834.7, and the rural mileage of roads was estimated at 3,654.1. The passenger movement totalled 599,800 persons, made up of 315,491 departures and 284,309 arrivals. There were 52,166 telephones in service and 29 broadcasting stations, including two television stations. A total of 2,741 vessels with a net registered tonnage of 13,072,438 entered the 11 ports of the island.

Agriculture.—Yields of the various agricultural products for the crop year 1955 were estimated as follows: sugar cane, 9,872,967 short tons; tobacco, 340,100 cwt.; pineapples, 30,170 short tons; coffee, 193,000 cwt.

Manufacturing.—Production of the most important items during fiscal year 1954-55 were: raw sugar, 1,164,902 short tons; refined sugar, 210,430 short tons; blackstrap molasses, 56,278,713 gal.; distilled spirits, 4,141,588 proof gal.; beer, 14,720,845 gal.; rum, 4,172,194 wine gal.; portland cement, 4,060,519 bbl. of 376 lb. each; cigars, 141,235,000 units. The total value of building permits granted was \$54,757,069. Electric power generated totalled 963,060,022 kw.hr., of which 252,878,510 kw.hr. was generated by water power.

(J. R. N.)

Mineral Production of Puerto Rico

(In short tons, except as noted)

Mineral	1952		1953	
	Quantity	Value	Quantity	Value
Cement (bbl.)	3,994,000	\$10,518,000	3,641,000	\$ 9,335,000
Iron ore	155,000	797,000
Lime	9,000	195,000	7,000	157,000
Salt	13,000	122,000	13,000	131,000
Sand and gravel	123,000	164,000	227,000	250,000
Stone	689,000	1,807,000	648,000	1,237,000
Other Minerals	7,000	..	20,000
Total	\$13,610,000	..	\$11,130,000

Mineral Production.—The accompanying table shows the tonnage and value of those mineral commodities produced in Puerto Rico in 1952 and 1953 (preliminary) whose value exceeded \$100,000.

Pulitzer Prizes. The annual Pulitzer prizes in journalism, letters and music, first awarded in 1917, were established at Columbia university by the will of Joseph Pulitzer. The five prizes in letters, of \$500 each, were awarded in 1955 as follows: fiction, to William Faulkner for *A Fable* (Random House); biography, to William S. White for *The Taft Story* (Harper); history, to Paul Horgan for *Great River, the Rio Grande in North American History* (Rinehart); poetry, to Wallace Stevens for his *Collected Poems* (Knopf); and drama, to Tennessee Williams for *Cat on a Hot Tin Roof* (New Directions). This was Williams' second Pulitzer award, he having received the drama prize in 1947 for *A Streetcar Named Desire*.

Journalism prizes (\$1,000 each, except for the award for disinterested and meritorious public service which is a gold medal) were awarded as follows: for disinterested and meritorious pub-

BURL IVES AND BARBARA BEL GEDDES in a scene from "Cat On a Hot Tin Roof," 1955 Pulitzer prize-winning play by Tennessee Williams

lic service rendered by a U.S. newspaper, to the *Columbus Ledger* and *Sunday Ledger-Enquirer* (Ga.) for an editorial attack which helped to destroy the corrupt city government in Phenix City, Ala.; for distinguished editorial writing, to the *Detroit Free Press* (Mich.) for an editorial by Royce Howes entitled "The Cause of a Strike," which analyzed the responsibilities of labour and management in the unauthorized Chrysler strike of July 1954; for a distinguished example of local reporting under pressure of edition time, to Mrs. Caro Brown, of the *Alice Daily Echo* (Tex.), who uncovered a one-man political rule in Duval county; for a distinguished example of local reporting not under pressure of edition time, to Roland Kenneth Towery, of the *Cuero Record* (Tex.), who exposed a scandal in the administration of the Veterans Land program in his state; for a distinguished example of reporting on national affairs, to Anthony Lewis, of the *Washington Daily News* (D.C.), for a series of articles considered to be responsible for clearing a navy department employee unjustly dismissed as a security risk; for a distinguished example of reporting on international affairs, to Harrison E. Salisbury, of the *New York Times*, for a series of articles, "Russia Re-Viewed"; for a distinguished cartoon, to Daniel R. Fitzpatrick, of the *St. Louis Post-Dispatch*, for his cartoon, "How Would Another Mistake Help?" commenting on possible U.S. intervention in Indochina. The award also recognized this cartoonist's work throughout 1954 and his entire career, he having previously won the Pulitzer prize in 1926.

The prize for the outstanding example of news photography went to John L. Gaunt, Jr., of the *Los Angeles Times*, for a picture captioned "Tragedy in the Surf," showing at the ocean's edge young parents whose child had been drowned.

The prize in music was awarded to Gian-Carlo Menotti for "The Saint of Bleecker Street." Menotti also won the Pulitzer prize in music in 1950 for "The Consul." The \$1,500 scholarship in art was awarded to Jack W. Henderson, a student at the Art Students League of New York. (A. J. RR.)

Quarles, Donald A(burey) (1894—), U.S. secretary of the air force was born at Van Buren, Ark., on July 30, and took his bachelor's degree at Yale university in 1916, specializing in mathematics. He then enlisted in the U.S. army and saw service as an artillery officer in France during World War I. Mustered out in 1919, he joined the engineering division of Western Electric company—later the Bell Telephone laboratories—of which he became vice-president in 1948. In 1952 he was named vice-president of Western Electric and president of Sandia corporation, a subsidiary of Western Electric. In 1946-47 he was the Republican mayor of Englewood, N.J. In 1952-53 he was president of the American Institute of Electrical Engineers. On July 28, 1953, he was appointed U.S. assistant secretary of defense for research and development, in which office he supervised the development of new weapons, especially intercontinental and other types of guided missiles. He also was a key figure in the plans for the earth-circling artificial satellite scheduled for launching in 1957-58.

Quarles was named by Pres. Dwight D. Eisenhower Aug. 11, 1955, as secretary of the air force to succeed Harold E. Talbott.

Quebec. Largest province in Canada, Quebec has an area of 594,860 sq.mi. and extends westward from the Gulf of St. Lawrence, along the lower St. Lawrence river. Pop.: (1951) 4,055,681; (official June 1, 1954, est.) 4,391,050. Pop.: French language 82%, British origin 12.1%, others 5.9%. Capital: Quebec city, pop. (official est. 1954) 279,378. Largest city: Montreal, pop. (metropolitan area, official est. 1954) 1,563,363.

History.—Economic development rather than political affairs caught the Quebec headlines in 1955. Premier Maurice Duplessis attended opening ceremonies of a new \$20,000,000 asbestos ore-treating mill at Asbestos, Que., and then announced the construction of a \$6,000,000 smelter plant for copper-nickel concentrates at Chicoutimi in the Saguenay river-Lac St. Jean area. In the nearby Chibougamau mining field, Opemiska copper mine started ore production, while in northeastern Quebec the Aconic titaniferous iron ore interests concluded contracts to ship iron ore to west Germany and to United States steel mills.

Premier Duplessis and his government extended rent controls for another year. The Union National administration also made an upward revision of benefits under the Workmen's Compensation act. In 1955 the new Quebec personal income tax of 15% of the federal tax less a 5% deduction went into effect. The Quebec stand on taxation provoked a conference of all the provinces with the federal government to review tax rental agreements under which all provinces except Quebec yield income tax rights in exchange for grants. Construction of the Quebec portion of the international St. Lawrence Seaway project commenced in the port of Montreal and immediately west with construction of dikes for the deep water channel.

Education.—Primary school figures for 1952 (latest available in 1955) showed 734,102 pupils and 31,785 teachers. There were 6,431 students in normal schools, 16,124 students in secondary classical colleges and 40,228 students in universities. The government budgeted \$60,000,000 for educational purposes in 1955-56.

Health and Welfare.—The meal tax of 5% on restaurant meals priced 60 cents or more in 1953 raised \$4,165,683 toward support of general hospitals and other institutions. Liquor taxes contributed \$1,000,000, and other sources included amusement tax, theatre and dance hall admissions, race tracks and pari-mutuels. Nevertheless, the province made up a deficit of \$24,869,590 out of general revenues. The province's 50% share of old-age pensions in 1952 totalled \$5,893,084; its 25% share of blind pensions was \$369,000. In March 1954 there were 1,562,685 children in 585,050 families receiving monthly allowances ranging from \$5 to \$8.

Transportation and Communication.—Quebec reported 41,757 mi. of public roads as of March 31, 1953, exclusive of the large cities, with 68.8% classified as improved roads. Latest figures (1953) showed motor vehicle registrations at 617,855. In 1952 there were 850,528 telephones. Railway track mileage was 5,108.39 in 1952.

Banking and Finance.—The provincial budget for 1954-55 for the period ended March 31, 1955, reported revenues of \$327,325,000, ordinary expenditures of \$262,045,000, capital expenditures of \$64,596,000 and public debt charges of \$26,701,000. Surplus on ordinary account was \$38,799,000, and deficit after capital expenditures was \$26,017,000. Capital expenditures for the year included \$3,088,000 for development of hydraulic resources, \$43,910,000 for roads, \$10,895,000 for public works. Ordinary expenditures included \$27,298,000 for youth and social welfare, \$10,173,000 for land settlement, \$40,818,000 for education, \$60,408,000 for health, \$11,560,000 for public works and \$29,897,000 for roads. Savings deposited in provincial co-operative people's savings banks totalled \$286,883,023 in 1953.

Agriculture.—Gross value of agricultural production was \$491,000,000 in 1954, which was four times the average value for the 1935-39 period. Farm cash income in 1954 was \$408,000,000, nearly 4% above 1953. Cash income (1954) included: dairy products, \$154,000,000; livestock, \$112,000,000; poultry and eggs, \$51,000,000; forest products, \$45,000,000; fruits and vegetables, \$20,000,000; field crops, \$8,000,000; miscellaneous products, \$18,000,000.

Fisheries, Furs and Forests.—In 1954 lobsters for the second consecutive year displaced cod as top producer for the fisheries industry with a total value of \$823,569. Cod caught was worth \$766,714, about half the traditional average. Total value of pelts of fur-bearing animals taken in 1953 in Quebec was \$2,157,388. Mink led with \$910,128, then beaver with \$373,300, muskrat with \$308,515. Silver-blue mink totalled an extra \$147,077 and mutation mink \$144,928. In the lumbering industry, gross value of Quebec production reached \$89,401,801 in 1951, an increase of 21.5% over 1950.

Manufacturing.—Quebec is Canada's second greatest manufacturing province, with 12,024 manufacturing establishments reported in 1952. Six leading industries are pulp and paper, nonferrous metals, petroleum processing, meat packing, cotton fabrics and clothing. Value of manufactured products in 1953 was \$5,370,000,000 or 30% of all Canadian manufacture. Employees totalled 439,667 with earnings totalling \$1,216,894,000.

Mining.—Value of mineral production reached a new peak in 1954 at \$275,600,000, an increase of 9.2% over 1953 and 2% over the previous peak of 1952. Production included: metals, \$126,200,000; industrial minerals, \$95,000,000; building minerals, \$54,400,000; asbestos, \$79,300,000; copper, \$48,200,000; gold, \$37,300,000; zinc, \$25,300,000.

Radford, Arthur William (1896-), U.S. naval officer, was born at Chicago, Ill., on Feb. 27; graduating from the U.S. Naval academy at Annapolis, Md., in 1916, he was commissioned ensign that year and subsequently advanced through the ranks to full admiral in 1949. An early navy flier, he was trained at Pensacola, Fla., air station in 1920 and was assigned to the naval bureau of aeronautics in Washington, D.C. (1921-23). Later he was assigned to air units of various ships at sea and was commander of the naval air station at Seattle, Wash. (1937-40). During the early part of World War II, Radford was in charge of aviation training at the naval bureau of aeronautics; in Jan. 1943 he was ordered to duty in the Pacific as commander of a task force preparing the way for and supporting U.S. landings on Tarawa, Makar and Makin Islands. In Nov. 1944 he became commander of an aircraft carrier division in the Pacific, participating in the two Jima and Okinawa campaigns and in air strikes against the Japanese homeland. After the war he was assistant deputy chief of naval air operations in Washington, then commander of an Atlantic task fleet. He became vice-chief of naval operations in Jan. 1948, and the following year was appointed commander in chief of the U.S. Pacific fleet and high commissioner of U.S. trust territories in the Pacific.

On May 12, 1953, Radford was nominated by Pres. Dwight D. Eisenhower to succeed Gen. Omar N. Bradley as chairman of the U.S. joint chiefs of staff—first navy man to hold this post.

During a tour of the far east early in 1955, Radford de-

clared that the U.S. would use its nuclear weapons if necessary in meeting any new communist attack on South Korea. Later he suggested the possibility of a blockade of Red China. In April he returned to Formosa for secret talks with Chiang Kai-shek. On May 25, 1955, he was appointed to his second term as chairman of the joint chiefs of staff.

Radio and Television. The number of radio stations in operation or under construction throughout the world in Oct. 1955 was estimated at about 8,200. This number, which reflected little change from the estimate of 8,000 in Oct. 1954, included amplitude modulation (AM) and frequency modulation (FM) broadcasting stations and also boosters or relay stations which are used for broadcasting purposes in some parts of the world. In television, according to compilations made by *Broadcasting-Telecasting* magazine for its 1955-56 *Telecasting Yearbook*, about 700 to 750 stations were either on the air or in process of construction. This number also was approximately the same as in Oct. 1954.

Throughout the world, there were 225,000,000 to 250,000,000 radio receiving sets in use as against 210,000,000 to 220,000,000 a year earlier. In addition, about 33,500,000 television sets were in use in the U.S., and *Broadcasting-Telecasting's* compilations showed another 7,000,000 to 10,000,000 in other parts of the world. The estimated world total of 40,500,000 to 43,500,000 television sets may be compared with 36,800,000 sets in Oct. 1954.

U.S. Manufacturing.—Production of radio sets in the U.S. in 1954, latest year for which official figures were available in 1955, totalled 10,400,530. This figure, from records kept by the Radio-Electronics-Television Manufacturers association, compared with 13,368,556 turned out in 1953 when production was the highest since 1950. Television-set production in 1954 continued to climb, reaching a total of 7,346,715 as compared with 7,214,827 in 1953 and the high of 7,463,800 in 1950. In reporting the 1954 output, the trade association pointed out that 21,500 colour television sets and 1,383,486 receivers capable of receiving the new ultrahigh-frequency (UHF) transmissions were included in the total. The 1954 radio total consisted of the following: 3,067,644 home sets; 1,333,518 portables; 4,124,460 automobile radios; and 1,874,908 clock radios.

During the first eight months of 1955 radio-set production picked up sharply, and television-set output also continued to gain. Reports of the manufacturers' trade association showed 8,725,012 radio sets manufactured during this period, a gain of 43% over the same period of 1954, while television-receiver output totalled 4,820,991 for a 27% increase. Automobile sets accounted for 4,469,179 of the radios turned out during the first eight months; home sets totalled 1,792,142; portables 1,355,895; and clock radios 1,107,796.

Sets in Use.—The total number of radio sets in working order in the U.S. in Sept. 1955 was estimated by the Radio Advertising bureau, a trade organization, at 121,000,000. This number included 80,000,000 in homes, 31,000,000 in automobiles and 10,000,000 in other locations outside the home. These estimates reflected a 16-month growth of 5,260,000 home and 4,820,000 automobile sets as compared with the findings of a special study conducted by Alfred Politz Research Inc., independent research firm, which showed 74,740,000 home and 26,180,000 automobile radios in May 1954. The Politz firm did not estimate out-of-home sets other than those in cars.

The number of television receivers in working order in the U.S. in early Oct. 1955 was estimated unofficially as about 33,500,000. The U.S. census bureau reported that a total of 32,000,000 homes had one or more television sets as of June 1955.

U.S. Stations and Networks.—The total number of AM, FM and TV commercial stations on the air or under construction in the U.S. at the start of Oct. 1955 was 4,056 as compared with 3,887 a year earlier, according to figures compiled by *Broadcasting-Telecasting* from official records of the Federal Communications commission. Of the Oct. 1955 total, 3,739 were on the air as against 3,585 a year earlier. Not counted in these totals were 33 TV and a half-dozen FM stations which had been authorized to operate, noncommercially, in the educational field.

Commercial AM radio stations numbered 2,917 in Oct. 1955, a 12-month gain of 183. The number of these actually on the air stood at 2,764, compared with 2,611 in Oct. 1954. Commercially operated FM stations meanwhile continued to decline in number. The Oct. 1955 total was 559, compared with 575 in Oct. 1954 and 592 a year earlier. Of the 559 authorized, 540 were on the air in Oct. 1955, a drop of 21 during the 12-month period and 31 less than the Oct. 1953 operating total.

In television, 580 commercial stations had been authorized as of Oct. 1955, and 435 of these were in operation. These represented a net gain of two authorizations since Oct. 1954 and an increase of 22 operating outlets. Meanwhile, however, holders of 56 station authorizations had voluntarily given them up during the same 12-month period, raising to 153 the number of such permits relinquished since the FCC lifted its "freeze" on construction in mid-1952. Of the 153 permits thus abandoned, 30 were for stations assigned to operate in the established very-high-frequency (VHF) band of the spectrum and 123 were for stations in the newer ultrahigh-frequency (UHF) region.

In addition to the commercial television authorizations, 33 noncommercial educational permits brought the number of TV stations operating or authorized to a total of 613. The number of noncommercial outlets actually in operation more than doubled, totalling 16 in Oct. 1955 as compared with 7 in Oct. 1954.

U.S. Networks.—There was one casualty among the nationwide television networks in 1955. The Du Mont TV network was discontinued in September after months of steadily dwindling income. In Oct. 1955 its parent corporation, Allen B. Du Mont laboratories, of which Paramount Pictures Inc. was an important stockholder, approved a stock spin-off in which an entirely new Du Mont Broadcasting corporation was formed to concentrate on the two television stations already owned by the network, WABD in New York city and WTTG in Washington, D.C., and to acquire additional stations and operate them more or less independently rather than as part of a separate network.

The other three national television networks continued to grow. They were operated by American Broadcasting company, Columbia Broadcasting system and National Broadcasting company.

All four nation-wide radio networks continued operations. Three of these were operated by the three remaining television network companies, ABC, CBS and NBC. The fourth was the Mutual Broadcasting system.

Subscription Television.—A controversy which split the broadcasting industry and aroused much public debate took form in 1955 in a movement to legalize subscription or pay-as-you-see television.

There were many techniques by which subscription television could be conducted. The essential principle was that television programs offered under any such system could not be seen by a set owner unless he paid to see them. The principal advocates of the pay-TV theory maintained that programs of a quality and scope too expensive for standard television broadcasters—Broadway musical shows, operas, great sports events, etc.—should be made available, via subscription TV, to viewers willing to pay for them. The probable fees for such shows were

generally estimated at around \$1 per program. Owners whose sets were equipped to receive such programs would be allowed to pick and choose those which they wanted, paying only for those they tuned in.

Major segments of the broadcasting industry condemned the toll television idea wholeheartedly. They contended it was contrary to the fundamental theory of free broadcasting in the U.S., that it was unfair to make the public pay for the privilege of viewing and that in the long run pay television would destroy the present system of commercial TV broadcasting altogether. They claimed—and proponents of the pay system denied—that pay-television operators would outbid broadcasters for rights to outstanding programs and events such as are now provided free, with the result that free television's programming would suffer and the public eventually would have little or no programming available to it except that for which it was willing to pay.

U.S. Commercial Broadcasting.—Total revenues of the radio broadcasting industry (AM and FM, networks and stations) in 1953, latest year for which official radio figures were available by Oct. 1955, edged 1.1% above the preceding year's record total to a new peak of \$475,300,000, according to reports compiled by the Federal Communications commission from data supplied by networks and stations. The much younger television industry also reached a new high in 1953, gaining 33% for a total of \$432,700,000. Thus, FCC pointed out, the radio and television broadcasting industry's grand total revenues—that is, money received from the sale of time, talent and program material to advertisers—reached \$908,000,000 in 1953 for the highest total on record. (See Table I.)

In 1954 TV networks and stations continued their strong climb, recording \$593,000,000 in revenues for a gain of 37% over the 1953 television total. The comparable report for the radio industry in 1954 had not been completed by FCC by Oct. 1955.

Radio.—While the latest report available from FCC showed that total AM-FM broadcasting revenues had gained in 1953, the share recorded by the networks and their owned stations declined slightly. The four nation-wide networks, three regional networks and 22 network-owned stations reported 1953 revenues aggregating \$97,300,000, or 3.3% less than in 1952. With operating costs amounting to \$86,900,000, the networks and their owned stations were left with \$10,400,000 in profits, a drop of 7.1% below the preceding year's total. A total of 2,457 other radio stations reported total revenues of \$378,000,000, a 2.4% gain, but expenses totalling \$333,400,000 cut their aggregate profits to \$44,600,000 before payment of federal income taxes, or 8.8% less than the profit total in 1952. For the broadcasting industry as a whole (all networks and stations) profits were down 8.4% from the 1952 level, amounting to \$55,000,000. (See Table II.)

Radio time sales, the backbone of revenues, aggregated \$477,206,000 in 1953 for a slight gain (0.9%) over 1952. Continuing the trend that had been in effect for several years, time sales by networks showed a drop, falling 10.4% to a total of \$98,057,000. Nonnetwork time sales to national and regional advertisers, however, increased 4.8% to a total of \$129,605,000 and time sales to local advertisers went up by almost as great a proportion, 4.1% to \$249,544,000. These figures did not include 45 FM stations that were independently operated. Nor did FCC make a separate report on FM finances in 1953 as it had done on occasion in the past. However, because of the comparatively small number of FM stations in operation and because many of these did not attempt to sell time but rather were operated as a "bonus" to advertisers buying time on affiliated AM stations, FM's share of the AM-FM totals was known to be minor.

Estimated Radio Net Time Sales for 1954.—Although the FCC report on the radio industry's 1954 finances had not been

issued by Oct. 1955, *Broadcasting-Telecasting* estimated 1954 net time sales would approximate \$453,385,000, broken down as follows: national network \$76,219,000; regional and miscellaneous network \$4,666,000; national and regional nonnetwork sales \$121,935,000; and local time sales \$250,565,000.

Television.—Total broadcasting revenues of the television industry—networks and stations—went from \$324,200,000 in 1952 to \$432,700,000 in 1953 to \$593,000,000 in 1954, according to the FCC reports. Broadcast income, revenues less expenses but before federal income tax, rose from \$55,500,000 to \$68,000,000 to \$90,300,000 in the same period.

For all networks and stations, time sales in 1953 totalled

MARY MARTIN AS PETER PAN in a 1955 colour television production of the J. M. Barrie play

\$384,692,000 or 36% more than in 1952. Network time sales were up 25% to \$171,900,000; nonnetwork time sales to regional advertisers gained 55% to reach \$124,318,000; and local time sales rose 36% to \$88,474,000. Sales of talent and program material to advertisers added \$109,546,000 or 25% more than in the preceding year.

U.S. Programs.—Big shows, such as the 90-minute, specially prepared "colour spectaculars" which the major networks launched in 1954, became regular television fare in 1955. NBC-TV, which created the "spectacular," continued this series and initiated others, including one called "Wide Wide World" which, using live cameras, took viewers to outstanding events, historic sites and scenic spots not only in the U.S. but occasionally in Canada and Mexico as well. NBC-TV also presented, among other features, a colourcast of a Broadway production of James M. Barrie's classic *Peter Pan* which was produced by an estimated 65,000,000 viewers. CBS-TV produced a film version of Charles Dickens' *A Christmas Carol* at Christmastime and, among other extravaganzas on its schedule, presented playwright-actor Noel Coward with musical comedy star Mary Martin (who also had starred in *Peter Pan*) in a special 90-minute production opening a new CBS-TV series in Oct. 1955. ABC-TV, although not yet telecasting in colour, introduced a number of major series. One of its most popular was a series of hour-long weekly programs by Walt Disney, creator of the Disney motion-picture cartoons, which, called "Disneyland," quickly became the top-rated television series for children. Another, launched in the fall of 1955, presented similar programming for an hour a day, Monday through Friday, under the name "Mickey Mouse Club."

The volume of colour television broadcasting increased greatly in 1955. NBC-TV's schedule for the fall season called for almost five times as many hours of colour programming as

that network presented in the 1954 fall season. In Oct. 1955, for instance, NBC-TV was ready to present 37 hours of live studio programming in colour as compared with 7 hours in Oct. 1954, and the 37 hours did not include World Series baseball, football games and other outside events which NBC-TV telecast in colour. CBS-TV planned a colour increase of approximately the same magnitude although full details of its plans had not been announced by Oct. 1955.

The summer and fall of 1955 also produced a boom in the popularity of big jack-pot quiz shows. CBS-TV started the trend when it launched "The \$64,000 Question," which offered prizes up to \$64,000 in cash to contestants. This show's immediate rise to the top of the audience ratings led other networks to launch new giveaway programs of their own, such as "The Big Surprise," which offered up to \$100,000 on NBC-TV, or to add new features to prize programs already on the air, such as "Stop the Music" on ABC-TV.

Radio network programming also underwent far-reaching changes in 1955. In the most radical departure, NBC launched its week-end "Monitor" series, a 40-hour, round-the-clock program of news, features, music, interviews, sports, vignettes, etc., with pickups from points around the world as well as in the U.S. After an extended tryout of "Monitor" as a week-end service, NBC planned to extend the same concept of programming into daytime hours each day of the week, starting in November.

ABC radio also introduced, in Oct. 1955, a new type of radio programming designed for "personalized listening." Inserted at first into ABC radio's evening schedule but slated for later expansion into additional hours, the new format encompassed short segments of such diverse fare as advice on marriage, family and career problems, inspirational messages, on-the-spot visits to people and places in the U.S. and Europe, accounts of unusual events, classical readings and humorous features.

Mutual also put more and more stress on what it called "companionate" radio programming, starting in mid-1955. CBS radio strengthened its evening line-up of programs featuring "name" talent, such as Bing Crosby and "Amos 'n' Andy," but did not follow the other networks' lead in departing from the traditional pattern of presenting regular programs of the usual lengths, 15 minutes, half-hour or full hour, at the same times week in and week out.

Both radio and television continued to devote substantial periods of time to the coverage of outstanding public events. One notable innovation for television occurred Oct. 25, 1954, when Pres. Dwight D. Eisenhower permitted a cabinet meeting to be televised for the first time in history. On Jan. 19, 1955, television and newsreel cameramen were allowed to cover a presidential news conference for the first time. The telecast was not live, but the films were edited quickly by the White House and carried on the networks the same day. This became regular procedure thereafter and the public gained an insight into national and international affairs that never before had been available to it.

In the field of entertainment programming, top-rated network programs—radio and television separately—are shown in the accompanying tables as they ranked at two different periods of 1955 (August and January).

Awards.—The 12th annual awards of the Alfred I. du Pont Awards foundation were presented in March to WHAS, Louisville, Ky., station owned by the *Louisville Times and Courier-Journal*, for "programming which consistently shows a lively sense of public responsibility and an awareness of public and community interests"; to KGAK in Gallup, N.M., for "initiative shown in establishing and maintaining radio service to the Navajo and Zuni Indians in their own languages, thereby bring-

ing radio communication for the first time to these Indian peoples"; to Eric Sevareid, CBS commentator, for "thoughtful and lucid analysis of the current scene, for penetrating knowledge of men and events combined with tolerance, reasonable-

ness, and a leavening of friendly or caustic humor." Additionally, the foundation presented special commendations to WCBS-TV, New York city station owned by CBS, for shows of "unusual educational and spiritual value," and to KMJ-TV in Fresno, Calif., for "unusually comprehensive programming in the fields of agriculture and education."

The 15th annual George Foster Peabody awards for distinguished achievement in radio and television, administered by the Henry W. Grady school of journalism of the University of Georgia, Athens, with the national Peabody advisory board, were presented in April to George Gobel, NBC comic, in the field of television entertainment; John Daly of ABC in the field of radio-television news; the "Adventure" program on CBS-TV in television education; "Disneyland" on ABC-TV for youth and children's television programs; "Industry on Parade," a film by the National Association of Manufacturers, for television national public service; WJAR-TV, Providence, R.I., for its presentation on Hurricane "Carol" in the field of television regional public service; "Conversation" program on NBC for radio entertainment; "Man's Right to Knowledge" on CBS for radio education; "Pauline Frederick at the UN" on NBC for radio contribution to international understanding; KGAK, Gallup, N.M., for its "Navajo Hour" for radio local public service. The judges also issued special awards in television to "Omnibus" and "The Search," both CBS-TV programs, and a citation to Boris Goldovsky (Metropolitan Opera, ABC) for radio music. (S. T.F.; R. W. CR.)

Technical Developments.—The expansion of colour television as a nation-wide service continued during 1955, encouraged by the increasing production and sale of large-screen home receivers and a substantial rise in the total of hours devoted by the major television networks to programs in colour. Other significant developments included a growing trend toward simplification and miniaturization of electronic communications equipment, the development of promising new techniques for the long-distance transmission of VHF (very-high-frequency) and UHF (ultrahigh-frequency) radio signals and the broadening application of television to industrial, educational and medical uses.

Colour Television.—The growth of colour television was given impetus during 1955 by the introduction of a simplified 21-in. home colour receiver by the Radio Corporation of America and by major advances in standardizing and speeding production of the 21-in. colour picture tube. The new receiver, which entered production in early summer, incorporated 26 electron tubes in its circuits, compared with 36 employed in previous 21-in. colour sets. In manufacture of the picture tube for the television-set industry, RCA introduced a special optical lens to achieve the precise location of more than 1,000,000 tiny colour phosphor dots on the tube face by means of a projection process, thus simplifying substantially the task of achieving uniformity at an important stage in production.

In the field of studio colour equipment, several manufacturers completed and introduced new systems for telecasting colour film and slides and for further improving colour transmission. A simplified system for the live pickup of colour in studios was announced in July by Du Mont laboratories. This system, called Vitascan, employed a special lighting system in combination with a special camera.

Network colour broadcast facilities were further expanded with the opening of new studios on the west coast and the re-engineering of cross-country communications routes by the American Telephone and Telegraph company to accommodate colour programs. By the early part of 1955 these routes had been extended to carry colour to 139 broadcasting stations in

101 cities.

New types of transmission equipment also were put into limited use by A. T. & T., including a new microwave antenna system that was expected to permit the handling of up to 30 television programs or 20,000 telephone conversations simultaneously.

Closed-Circuit Television.—The development of new or improved closed-circuit equipment encouraged further application of television to a variety of medical, scientific, educational and industrial uses. In medicine, demonstrations were conducted to show the value of colour television in transmitting medical information from the operating room and the laboratory to medical students and medical conventions. Such demonstrations held on the east coast in January and September involved the telecasting of a surgical operation and an intercity consultation of pathologists concerning diagnosis of a diseased tissue. In Sept. 1955 the first installation of compatible colour television for hospital use was announced by the Walter Reed Army Medical centre, Washington, D.C., and RCA. Intended for use in instruction and consultation, the system was to include three complete colour chains installed at the Walter Reed hospital, the Army's Graduate Medical school and the Armed Forces Institute of Pathology. The systems would operate either independently or as an integrated system, with camera installations in operating rooms and laboratories and colour television receivers located at various points for convenient viewing. An innovation in the system was the newly developed RCA Vidicon colour television camera designed specifically for operating room use. The camera, approximately the same size and weight as standard black-and-white studio TV cameras, was developed in conjunction with separately packaged camera control, monitoring and power supply units to form a portable system weighing about 300 lb.

Several installations of closed-circuit television were completed during the year in educational institutions for group

instruction and demonstrations. Among them was an installation at New York university, New York city, for instruction of approximately 500 students. The most comprehensive of these systems was installed at Stephens college, Columbia, Mo., to include 50 classrooms, for use in an orientation course for first-year students.

Radio.—1955 brought a marked increase in the design and production of miniaturized radio broadcast receivers employing transistors rather than electron tubes. Pocket-size, personal radio sets were placed on the market by several manufacturers, most of them designed for many hours of operation on batteries of the type used in flashlights. Transistorized automobile radios also were introduced during the year. One experimental model was designed to operate directly from a 12-v. car battery, employing less than one-tenth of the power required for operation of a standard car radio equipped with electron tubes.

The use of microwave radio relay equipment for communications in industries and public service activities continued to expand. Among the important new installations announced during the year was a complete system for the Ohio turnpike, involving two-way communication between highway patrol stations and official vehicles.

Military Radio and Television.—The trend toward miniaturized communications equipment was most evident in military applications. A typical example was a two-way FM radio, or transceiver, capable of receiving or transmitting over a range of a quarter of a mile. Designed for use with small tactical units in the field, the transistorized device weighed only 15 oz. and was about the size of a small tobacco tin. In early Oct. 1955 the U.S. army signal corps announced development of an even more compact experimental radio transmitter powered by the human voice, in which sound waves were converted to electrical energy sufficient to operate the transistorized device over a range of several hundred feet.

An electronic innovation at sea was a comprehensive television system installed aboard the navy's new supercarrier "Forrestal." The navy disclosed that the giant vessel is equipped with a closed-circuit chain which allows the commander to maintain visual contact with key areas aboard the ship, and includes underwater television camera units.

Research Developments.—Research in forward scatter propagation of high-frequency wireless signals pointed toward a possible future means of transoceanic microwave and television communications. Based on the use of powerful transmitters and extremely sensitive receivers at points well beyond the horizon, scatter propagation already was in use during the year for transmission in these frequencies, sending VHF signals up to 1,000 mi. and UHF signals beyond 200 mi. without intermediate relay stations. The range of transmission in these frequencies previously had been limited largely to the line of sight, with relay facilities required for destinations beyond the horizon. Research indicated that radio communications employing scatter propagation techniques might permit long-distance point-to-point radio systems even less subject to interruption or failure than cable or wire facilities. Experiments with long-distance transmission of UHF television signals was undertaken during the year with successful reception at ranges of 150 to 200 mi.

Magnetic tape recording of television signals was carried closer to commercial application in field tests of the RCA system by the National Broadcasting company. In May 1955 the first long-distance transmission of a colour television program previously recorded on the magnetic tape took place over the NBC network facilities in a closed-circuit telecast from New York city to St. Paul, Minn. Early in the year another tape-recording system for black-and-white and colour television was demonstrated by Bing Crosby Enterprises, and plans were an-

ENGINEER TESTING TRANSMISSION in a medium called "long distance waveguide," a system for transmitting television and telephone conversations along hollow metal tubes announced in 1955

nounced for its commercial introduction in about 18 months.

Other important research developments in television included an experimental flat picture tube only three inches in depth. Employing a radically new method of electronic scanning, the tube was developed at the west coast laboratories of the Willys Motors corporation. Progress also was reported by RCA in development of a single colour pickup tube for television cameras, incorporating within one tube the colour pickup functions performed by three tubes in present colour cameras. The developmental tube showed in tests the ability to televise colour film and limited area scenes in which high levels of lighting are required.

(C. B. J.)

Radio Amateur Stations.—As of 1955 there were more than 35,000 persons licensed as amateurs by the Federal Communications commission to conduct private two-way short-wave communication. In co-ordinated volunteer activity, amateur radio-men operated days without rest in the wakes of Hurricanes "Carol," "Edna" and "Hazel." Reporting conditions to municipal authorities, almost as they occurred, amateurs with mobile radio units in their own cars contributed materially to the restoration of normal conditions. In less spectacular fashion, amateur communications furnished a vital link in dozens of local emergencies in all parts of the United States. Operation "Alert," a nation-wide civil defense test emergency in June, relied heavily on amateur communications systems in lieu of regular lines knocked out by the fictitious nuclear attack. The Edison Radio Amateur award was bestowed on Benjamin S. Hamilton of San Diego, Calif., for his outstanding organization of local civil defense communications.

More than 9,000 amateurs throughout the country manned portable and mobile emergency communications units for the annual field day test of the American Radio Relay league. During the event, the first radio transmitter to use energy from the sun was successfully demonstrated; six selenium photoelectric cells furnished a maximum of 2.8 v. to power the equipment. Expanded interest in mobile operation and single side-band techniques prompted the league to publish two new technical manuals, *The Mobile Manual for Radio Amateurs* and *Single Sideband for the Radio Amateur*. The Division for the Blind, Library of Congress, produced a new talking book of code and theory instruction aimed at the novice class amateur licence.

More than 800 local radio clubs affiliated with the league administered the FCC-established program of licence examinations given by volunteer examiners. Novice and technician class amateur licensees were granted additional frequency privileges. The Conelrad system to provide radio security in the event of enemy attack was set up for the amateur service. A favourable trend of sunspot activity permitted longer-distance communications in most of the amateur high-frequency band assignments.

(L. Ak.)

Radio Developments in Great Britain and Europe.—On July 27, 1955, the postmaster general issued two directions to the B.B.C. (British Broadcasting corporation) on the subject of political broadcasts. The first directed the corporation to retain the rule in force since 1948, whereby the B.B.C. was not allowed to broadcast discussions or ex parte statements on matters about to be debated in either house of parliament for a period of a fortnight before such debates took place. The direction also required that members of parliament should not broadcast on the subject of any legislation which was before parliament. The second direction required the corporation to refrain from the transmission of party political broadcasts other than to the U.K. as a whole. In accordance with the government's decision of Dec. 1954, the B.B.C. continued to broadcast programs in 43 languages other than English.

At the invitation of the B.B.C., 17 European broadcasting

WINNER OF \$64,000, U.S. Marine Capt. Richard McCutchen, receiving the congratulations of his father, J. C. McCutchen, who helped his son to answer successfully a series of questions about cooking on a popular U.S. television quiz program in 1955. An assistant on the show, Lynn Dollar, is shown opening the door of the soundproof booth in which the questions were answered

organizations co-operated in the compilation of a series of programs entitled "Europe—Ten Years After" at the beginning of May 1955. These programs surveyed progress and development in all fields of human endeavour during the postwar years. The European Broadcasting union, which had a membership of 25 active and 11 associate countries, celebrated its fifth anniversary on Feb. 12, 1955. Under the presidency of Sir Ian Jacob, director general of the B.B.C., the general assembly, the administrative assembly and the various committees met in Rome for the sixth ordinary session in October.

In Austria the coming into force of the Austrian state treaty resulted in the dissolution of the American-operated radio station Rot-Weiss-Rot on July 12. On the same day, Austrian National Radio, Österreichischer Rundfunk, discontinued the broadcast of "Voice of America" and "Russian Hour" programs and the relay of B.B.C. Austrian service programs from London.

In Germany agreement was reached to separate the Nordwestdeutscher Rundfunk, which was set up as an institution under public law in 1948, into two organizations: the Westdeutscher Rundfunk, to cover the *Land* North Rhine-Westphalia; and the Norddeutscher Rundfunk, to cover the *Länder* Lower Saxony and Schleswig-Holstein and the free and Hanseatic city of Hamburg. It was anticipated that the reorganization would take effect from Jan. 1, 1956.

On July 1 Radio Trieste formally returned to the control of Radio Italiana after a separation lasting ten years. In Yugoslavia legislation was introduced during the autumn with a view to the enactment of a Broadcasting Stations act. (A. Ex.)

Television in Great Britain.—The year 1955 was sharply divided into the periods before and after the opening of commercial television on Sept. 26. During the first period B.B.C. programs continued without, initially, much marked change.

Probably the most consistently high standard was preserved

by "Animal, Vegetable and Mineral," the archaeological quiz program, with its derivative "Buried Treasure." Glyn Daniel, fellow of St. John's college, Cambridge, chairman of this program, was dubbed "TV personality of the year" by the Guild of Television Producers.

Other serious programs from the talks department often touched a comparable level. In the case of "Press Conference," success was dependent on the personality of the celebrity interviewed. Christopher Mayhew's series on "Co-Existence" roused interest but its instalments were erratic. The talks department was also responsible for one of the year's greatest triumphs, the virtually all-night transmission of the general election results. For his part in this, Richard Dimbleby was given the leading position in the magazine program, "Panorama," when it extended scope as well as time.

The drama department did not discover much original work, though live productions continued on a high level. Most distinguished perhaps was Harold Clayton's of *Romeo and Juliet*, largely through its rare emphasis on pictorial beauty. Virginia McKenna was named best actress of the year by the Guild of Television Producers for her Juliet, and Peter Cushing, for the second time, best actor. Best designer was found to be Bruce Angrave for his ingenious work for "People Like Us," an experimental series of sketches for four players by J. B. Priestley. Two unsubtle but popular series were "The Whiteoaks Chronicle," from the Mazo de la Roche novels, and "The Makepeace Story," a more original cycle on the rise of the cotton industry. "The Grove Family" and the "Appleyards" continued to flourish. But the Producers guild award for the best script and the best production went to Colin Morris and Gilchrist Calder for "The Unloved," a sympathetic and skilful documentary about a maladjusted child.

"Eurovision" remained a strong B.B.C. card whose most thrilling trick was the television of a live performance of *Tosca* from an Italian studio.

From the film department came the ambitious series, "War in the Air," a fair equivalent to the U.S. "Victory at Sea." Of the compilation films on the work of various film stars, much the most important and interesting was the one on Greta Garbo.

First symptom of impending commercial competition was a steady trickle of trained talent from B.B.C. television. Big names which went almost straight from one to the other included not only B.B.C. producers such as Bill Lyon Shaw and Kenneth Carter but such celebrities as Orson Welles, Billy Graham, announcer Leslie Mitchell and comedians Harry Secombe and Arthur Askey with many lesser names. Some important stars, however, stayed with the B.B.C. Wilfred Pickles, for example, had long forestalled the audience participation which was to be the new mode. I.T.A. (the Independent Television authority) had captured the popular animal collectors, Armand and Michaela Dennis. But the subtler naturalists, Peter Scott in his "Look" series and David Attenborough in his two "Zoo Quests" to Africa and British Guiana, stayed with the B.B.C., as had one of TV's funniest comedians, Bob Monkhouse. Edana Romney with her "Is This Your Problem?" program and Jeanne Heal with her varied and accomplished interviews found no peers among I.T.A. hostesses. And in "Off the Record" Jack Payne had devised a formula for using popular recording stars.

One of the first surprises was the almost clean sweep of panel games. I.T.A. had only one indifferent sample. The B.B.C., after multiplying panel games *ad absurdum*, withdrew all but "What's My Line?" Instead, interest and curiosity centred on the audience participation and giveaway programs. These ranged from the sadistic crudity of "People Are Funny" to "Double Your Money" with its prizes for genuine knowledge. The first big win on the latter was by a university history graduate who had the

restraint to content himself with £512 instead of gambling for the £1,000.

Next to the giveaways, the principal attractions were variety programs, notably "Sunday Night at the Palladium." With such top liners as Gracie Fields, Johnnie Ray and Lena Horne and with the popular American comedy series, "I Love Lucy," following in the schedule, I.T.A. offered a strong counterattraction to the B.B.C.'s Sunday evening.

A feature of independent television was the more rigid timetable, cut into fixed slices of 15 or 30 minutes. The advertisements direct, the spot commercials, proved less startling than expected. Few were very imaginative, none offensive, most were innocuous and there were always the elegant Shell tours of Britain with John Betjeman. Drama, although presented under such titles as "Theatre Royal," "Four Star Theatre," "International Theatre," consisted almost entirely of chunks of film, more or less entertaining but seldom of high quality. Nevertheless numerous such famous names as Dame Edith Evans, Flora Robson, Wendy Hiller, Sir John Gielgud and Sir Ralph Richardson made obvious attractions. The "Granville Theatre Melodrama" also quickly won a place for itself with the viewing public.

The Independent Television News, with Chris Chataway the runner as first reader, was generally found more lively than B.B.C. news. Discussion programs, such as "Crossroads" or "Points of View," had the needed knack of informality.

By the end of the year independent television in Britain was only two months old and so far only covered a small southern stretch of England. The authority had shown itself perhaps too sensitive to the need for flexibility. It seemed likely that for some time the B.B.C. would lead in the more serious programs and lag behind I.T.A. in the big popular entertainments.

(F. B. Lr.)

Railroad Accidents: see DISASTERS.

Railroads. Following a rather slow start, railway traffic and revenues in the United States developed an upward trend during 1955, so that the railroads* had a better year than in 1954, although not as good as in 1953. Total 1955 railway revenues were \$10,100,000,000, compared with \$9,400,000,000 in 1954 and \$10,700,000,000 in 1953. After paying operating expenses, taxes and capital charges (but before dividends), the railroads realized \$915,000,000 in 1955, compared with \$674,000,000 and \$903,000,000 in 1954 and 1953, respectively. Traffic in the last three months of the year was running heavier than in either of the two preceding years, encouraging hope for continued favourable results in 1956.

Cars of freight originated on railroads in 1955 totalled 37,600,000, the 1954 figure being 33,900,000 and 1953 showing 38,300,000. Tonnagewise, railway freight traffic in 1955 came to 1,375,000,000 tons, hauled for a total of 620,000,000,000 ton-miles (one ton moved one mile), for an average haul of 437 mi. Passenger traffic, measured in passenger-miles (one passenger travelling one mile), totalled 28,300,000,000, with an average trip per passenger of 71 mi. This traffic was handled at an average revenue of 1.4 cents per ton-mile and 2.6 cents per passenger-mile. In October the Interstate Commerce commission authorized the railroads to make permanent and incorporate in their basic rates the increases in freight rates granted in 1951-52.

The physical plant of the railroads at the end of 1955 comprised 212,000 mi. of first main track and 140,000 mi. of second

* Unless otherwise specified, railroads herein refer to those of class I, which account for approximately 95% of total railway figures.

and other main tracks, yard tracks and sidings, making a total of 352,000 mi. of trackage. Utilizing this mileage were 33,000 locomotives, made up of 24,550 diesel-electric, 7,800 steam and 650 electric and other types. Passenger-train cars of railroad ownership totalled 34,100, consisting of 18,500 passenger-carrying cars and 15,600 cars used for mail, baggage and express; in addition there were 4,900 cars owned by the Pullman company. Freight cars totalled 1,831,900 of railroad ownership and 193,100 of private and other ownership, in addition to 21,000 cabooses and 85,000 units of work equipment. During the year the railroads installed in service 1,000 new locomotives (all diesel-electrics except 10 electrics), 40,000 freight cars and 450 passenger-train cars.

Approximately 1,050,000 persons were employed on the railroads in 1955, with a total payroll of \$4,800,000,000, averaging \$4,600 annually per employee. No large-scale suspension of service through labour disturbances occurred, other than a strike on the Louisville & Nashville railroad and its affiliates which lasted 59 days and was attended by some violence. In the closing months of the year, wage settlements were made with various classes of employees involving present and potential increases in the wage bill which could run as high as \$320,000,000 on an annual basis. For the first time the number of freight cars in a train was made a factor in determining the pay of trainmen. It was also considered probable that some increases in rates would be necessary to aid the railroads in meeting the increased wage bill.

Of outstanding importance was the report of the Presidential Advisory Committee on Transport Policy and Organization. This committee, appointed by Pres. Dwight D. Eisenhower, was composed of the secretary of commerce as chairman, the secretary of defense and the director of the Office of Defense Mobilization, with the secretaries of the treasury and of agriculture, the postmaster general and the director of the bureau of the budget participating on matters affecting their respective responsibilities. Its report, sent to the president at the end of 1954 and made public April 18, 1955, contained 11 basic recommendations, most of them founded upon the following principles: (1) Stimulation of reliance on competitive forces in rate making. This would be accomplished by relaxing regulation of railroads to permit them to utilize their inherent advantages and to make rates within a zone of reasonability bounded by the out-of-pocket cost of the service and the fully distributed cost thereof. (2) Protection of common carrier transportation services of all kinds by closer definition of private and contract carriers and curtailment of abuses by these carriers in respect to unfair competition with common carriers.

Further shifts in financial control of important railroads were witnessed in 1955. Following a proxy contest, the Boston and Maine came under new management. Changes in directorates affected the Chicago and North Western and the Missouri-Kansas-Texas railroads. The Toledo, Peoria & Western, previously owned and operated independently, was jointly acquired by the Atchison, Topeka and Santa Fe and the Pennsylvania railroads. Sale of the Illinois Terminal Railroad company to a group of 11 major railroads was authorized by stockholders. The Nashville, Chattanooga & St. Louis, controlled by the Louisville & Nashville through stock ownership, was authorized by the Interstate Commerce commission to merge with the parent railroad. An interesting venture toward state ownership and operation of a railroad was a bill introduced into the 1955 session of the Illinois legislature to authorize purchase of the Chicago Aurora and Elgin railway, a 54-mi. electric railway in financial difficulties.

Several railroads took steps during the year to replace preferred stock with nonsecured debt obligations bearing interest only if and as earned. Since payments of interest are deductible

before income taxes, whereas dividends are payable from earnings after taxes, the substitution reduces income taxes and thus increases amounts available for dividends on common stock. Railroads concerned in this trend during 1955 included the New York, Chicago and St. Louis (Nickel Plate); Chicago, Milwaukee, St. Paul and Pacific; Chicago & Eastern Illinois; Chicago, Rock Island and Pacific; New York, New Haven and Hartford; Bangor and Aroostook; and the Boston and Maine.

A notable financial event of the year was successful completion by the Baltimore & Ohio railroad of what was said to be the largest debt-refinancing program ever undertaken by an American railroad, involving about \$350,000,000. A significant operating change was the transfer in October to the Chicago, Milwaukee, St. Paul and Pacific of de luxe Union Pacific-Southern Pacific passenger trains which since 1889 had been handled between Omaha and Chicago by the Chicago and North Western.

Developments during 1955 in the use and expansion of trailer-on-flatcar (piggyback) service were numerous. This service is of two principal types: (1) where it is confined to traffic of the railroad itself or of a railroad-owned trucking subsidiary; and (2) where the service is also made available to shippers and trucking operators, without restriction. One result claimed from piggyback service, in addition to development or recovery of traffic for the railroads, was a marked reduction in claims against railroads for freight loss or damage.

Several lightweight, low-slung, high-speed trains of radical design were ordered by railroads in 1955. They included so-called Talgo trains purchased by the New York Central, New York, New Haven and Hartford and Boston and Maine roads and a development of Train X purchased by the New York Central and the New York, New Haven and Hartford railroads. Another type, based upon automotive body design and construction, was to receive operating tests on the Pennsylvania and the New York Central. Still another new type train, of tubular design, was ordered by the Pennsylvania railroad, and the New Haven road ordered a streamline train based upon a modification of the RDC cars which were being used on several railroads. In trial runs, a Talgo-train prototype was operated at speeds up to 103 m.p.h. on straight track, with curves taken comfortably at 85 m.p.h. Ownership and use of high-level dome cars affording a panoramic view of the countryside also increased. Electronic systems for faster reservation and sale of passenger space received further impetus.

Utilization of electronics for faster, more efficient classification of cars in yards also progressed. New devices not only automatically select and set up proper routes for cars from the hump to the classification track but also "remember" and store routes for additional cars for future use. In one instance, an entire train was automatically switched with an experimental development of this memory device.

Accounting work was greatly expedited through use of electronic equipment, including huge machines of almost unbelievable capacity and versatility. Among railroads which had ordered or installed these were the Chesapeake and Ohio; Southern; Illinois Central; and New York, New Haven and Hartford. Utilization of such machines requires intensive study and a high degree of precise programming.

A recent innovation of considerable progress was a device for self-identification of trains by means of an inert coil which is activated as it passes over a charged coil in the track. Identification is provided by tuning the inert coil to various frequencies of response. It was envisioned that this might lead to the automatic lining up of switches, setting of signals, posting of bulletin boards and announcing of trains. Experiments continued in the use of television for railroad purposes, principally

for inspection and supervision in remote parts of switching yards.

Research on nuclear energy in the railroad industry was evidenced by a contract between a locomotive builder and the Denver & Rio Grande Western railroad for study of plans suitable for locomotive use. Actual experimentation in direct hydraulic transmission of power from diesel engines to locomotive wheels was another promising innovation. Individual and co-operative research activities by railroads and by their suppliers along these and many other lines were in sight for 1956. (See also INTERSTATE COMMERCE COMMISSION.) (L. J. K.)

Canada.—A new branch was planned in Labrador to connect with the recently opened Quebec, North Shore and Labrador railway. In Quebec the Canadian National railways were starting to construct a line from St. Félicien to Chibougamau; this would in turn link up at Chibougamau with a western section being built from Beattyville on the national transcontinental line, totalling 288 mi. In Ontario an important new 24-mi. branch was opened in July from Hillsport to the Geco mine. In British Columbia progress continued with the southward extension of the Pacific Great Eastern railway from Squamish to Vancouver in extremely difficult terrain. In the maritime provinces the Canadian National was operating trains over its new Canso causeway, joining the mainland to Prince Edward Island, thus eliminating ferry service.

Both large Canadian railways received "Trainmaster"-type 2,400-h.p. diesel-electric locomotives, built in Canada. The Canadian Pacific railway inaugurated dome-type cars on its new "Canadian" Montreal-Vancouver service. A single three-unit diesel-electric locomotive worked this train throughout, covering the 2,881 mi. in 71 hr. 10 min. The Canadian Pacific placed in service a new train ferry at Vancouver, and the Canadian National provided its staff with a mobile signal instruction car.

Europe.—The reorganization of the British Transport commission in Jan. 1955 provided for a general staff at headquarters, the setting up of area boards for the six railway regions and the establishment of separate divisions to manage the road freight services, the road passenger services, the docks, the inland waterways and the hotels and restaurant cars. London Transport remained a separate executive under commission control. The modernization plan published early in 1955 set forth a 15-year plan, envisaging the expenditure of about £1,200,000,000, but about one-third of this total was accounted for by renewals of track, rolling stock, etc., which would take place in any case. The replacement of steam traction by electrification and diesel units on a comprehensive scale was planned, together with the equipment of freight rolling stock with continuous brakes, new marshalling yards and many other modern improvements, such as carriage-cleaning facilities and rebuilt stations.

The "Elizabethan" nonstop ran in 6½ hours between London and Edinburgh, 393 mi., in the summer months, a world record in steam traction. Electric traction had so far produced no fast runs in Britain. During the summer service there were 58 steam runs daily at more than 60 m.p.h. and consistent improvement continued in regard to cross-country services.

Financial results of the British Transport commission for 1954 revealed a working surplus of £45,500,000 but a deficit after fixed charges of almost £12,000,000. Wage disputes culminated in a strike of locomotive crews at the end of May 1955 lasting approximately two weeks, unofficially estimated to have caused a loss of revenue between £10,000,000 and £12,000,000.

In Northern Ireland there was further curtailment of rail in favour of road services. Progress toward complete dieselization of railway operation continued apace in the Irish republic, where the first units were received of a large diesel locomotive order for nearly 100 units, being constructed in Manchester.

French National railways made history when trial runs on the electrified line between Bordeaux and Bayonne registered speeds of 205.6 m.p.h. Of test character with light trains, this speed was a world record for railways, but was not to be regarded as suitable for commercial services. By conversion of the Maçon-Bourg section, the 1,450-mi. route from Paris to Syracuse in Sicily became electrically operated—the longest continuous electrified main line in the world. French railways continued to produce large deficits, partly because of war damage repairs.

Italian State railways were electrifying the Messina-Palermo section and main lines in the Padua and Foggia areas. Swiss Federal railways widened several important trunk lines, such as

Olten-Lausanne, while the use of trains to ferry motorcars through the St. Gotthard and Simplon tunnels, when roads are impassable, developed rapidly. West German railways inaugurated the diesel "Saphir" express between the Ruhr and Ostend, and articulated diesel units, known as the "Komet" and the "Senator," linked Hamburg with Frankfurt and Basle. These were the forerunners of the international diesel expresses to run between main western European cities. They would be known as Europexpresses; another recent service of this type was the Amsterdam-Brussels-Paris unit.

It was planned to change the three-class system to two classes of accommodation in western Europe in 1956. In Germany a rail-grinding train was inaugurated to reduce rail corrugations, and electrification was extended to the Freiburg-Basle and Bruchsal-Heidelberg sections. A new station at Heidelberg was completed. Better services operated to eastern Germany where many new "Pacific" (4-6-2)-type locomotives entered service. In Austria electric traction replaced steam between Vienna and Amstetten, Wels and Passau reaching Rosenbach on the Yugoslav frontier through the long Karawanken tunnel.

Belgian developments included the interesting direct rail-car link between Brussels Central station and Brussels airport at Melsbroek. In the Netherlands electric or diesel virtually replaced steam traction. With Switzerland, the Netherlands could claim to have one of the few European railways more than cov-

Above: GRAVITY SWITCHING YARD, permitting automatic sorting of freight cars, under construction by the Southern Pacific lines at Houston, Tex.

Above, right: "AUTOMATIC" machine placed in experimental operation by the New York Central railroad in Feb. 1955. Intended chiefly for use by suburban passengers, the machine, operated by coins, supplied tickets for about 60 stations

Right: CHRISTENING of lightweight "Aerotrain," built by General Motors Corp. in 1955. The train was to be given test runs by the New York Central and Pennsylvania lines in 1956

Right: "A HOG WILL RIDE But You Won't," was the protest of masked commuters on a New York Central suburban line which announced in 1955 its decision to abandon passenger, but not freight, service on the line

Below: "HI-LEVEL" chair car ordered in 1955 by the Santa Fe railroad in response to passenger requests for a better view of the scenery. Top level is for seating only, lower for lounge and luggage storage

ering interest charges on its capital. Danish State railways placed in service two new ferries, one on the Helsingor-Helsingborg route and the other on the Gedser-Grossenbrode service, which had developed very extensive traffic.

New lines were opened in Finland between Laaja and Suomussalmi and on the Suolahti-Haapajärvi line; widening was completed near Kouvola. Fast diesel services were operating from Helsinki. Polish railways electrified the Warsaw-Lodz artery and made progress with the Katowice line. Hungary completed the reconstructed Danube bridge at Komarom, linking it with Czechoslovakia, and converted many coal-burning locomotives to oil-firing. A new bridge over the Mur river between Murakeresztur and Kotoriba linked the Hungarian and Yugoslav railways.

U.S.S.R. railways completed a new station at Stalingrad. Greece received new Italian-built 2-10-2 steam locomotives weighing 195 tons. Spanish National railways extended electrification to the Ujo-Gijón (35 mi.) and the Busdongo-Leon (33 mi.) sections in Asturias. Steady progress continued with the new 280-mi. railway between Zamora, Orense and Santiago.

Asia.—India placed in service British-built 3,600-h.p. electric locomotives for the Bombay-Poona-Igatpuri sections of the Central railway, while electrification of the Eastern's Calcutta lines began, with extensions on the Southern railway at Madras Egmore and on the Western railway near Borivli. Large orders were placed for several hundred steam locomotives, and the first air-conditioned coaches entered service on Indian metre-gauge lines; about 300 metre-gauge coaches were under construction.

Of 855 mi. dismantled during World War II, about 500 mi. would be reopened by 1956; one such completed was the Madura line. New construction included the Chunar-Robertsganj line and a railway in Bihar. The new Charsadda line in Pakistan was the first to be built in the North-West Frontier province since 1918. Australian-built diesel locomotives entered service in Pakistan.

In Iran progress continued with the Shahrud-Meshed and Mianeh-Tabriz lines and new locomotives were imported from Britain. Malaya completed the reconstruction of its east coast railway and constructed a freight station in Kuala Lumpur.

Electrification of Japanese National railways covered 1,162 mi. Major construction continued on the links between the Chinese and U.S.S.R. railways, the new line passing through Ulan Bator.

Africa.—Additional "River" class 2-8-2-type steam locomotives arrived in Nigeria together with diesel-electric units. Gold Coast railways inaugurated their new passenger terminal at Takoradi harbour and placed in service new diesel-electric locomotives, as did the Sierra Leone railways. In French Cameroun an important bridge was opened in May across the Wouri river. Sudanese railways received 42 large oil-fired 4-8-2-type steam locomotives from Britain. In the Belgian Congo electrification was being extended to Elizabethville on the Bas Congo railway, and the construction of a link 276 mi. long was in hand between Kamina and Kabalo. The Western Uganda extension to Kasese neared completion. Rhodesian developments included all-electric signalling at Bulawayo and further centralized traffic control installations. South African railways planned widenings at Durban and on the Natal main line, additional electric locomotives and further electrification.

Red Cross. **United States.**—The year 1955 was an active one for the American Red Cross in services to the armed forces, disaster relief, the blood program, health and safety education, and other programs. Volunteers, nearly 2,000,000 of them, provided the majority of the services and the greater part of the leadership.

More than 40% of the organization's annual budget was expended in behalf of members of the armed forces, veterans and their families. Home service workers in the nationwide structure of 3,700 chapters, along with field directors in military hospitals and installations in the United States and overseas, assisted servicemen and their families in problems related to welfare and morale. A monthly average of 20,000 trained volunteers served in 128 military hospitals.

In the clubmobile program, Red Cross workers travelled about 16,000 mi. each month to bring recreation activities to 170,000 servicemen in isolated sections of Korea. The opening of a new recreation centre in France brought to four the number operating in Europe and North Africa. The purpose was to provide supplemental recreation activities and to increase the opportunity for friendly free-time contacts between U.S. forces overseas and the local population.

Red Cross chapters assisted about 42,000 veterans and their families each month and during the year provided \$800,000 in emergency financial assistance. Under volunteer direction, approximately 19,000 volunteers—Gray Ladies, nurse's aides, cadet workers and others—served each month in 172 Veterans administration hospitals.

Mass care assistance had been given to 124,100 persons in 1954 following disasters in 44 states, Alaska, Puerto Rico and Hawaii. Rehabilitation, which included the building and repair of houses, long-term medical and nursing care, basic maintenance, and assistance with household furnishings and occupational supplies, was given 13,200 families. Expenditures totalled \$3,714,000. The May 1955 tornadoes that struck in a four-state area devastated several Kansas and Oklahoma communities. Approximately 600 families were affected, and it was estimated that the cost of emergency care and rehabilitation would exceed \$1,000,000. Through the League of Red Cross societies, 17 other countries were also aided in recovering from disasters.

The Red Cross blood program, directed at all levels by physicians, by 1955 had 47 regional programs covering chapters in 40 states and the District of Columbia. Nearly 2,500,000 blood donations were received in 1954. Blood and blood products were distributed to 3,600 hospitals in 45 states and the District of Columbia. Volunteers gave more than 2,500,000 hours of service in this program. During the first six months of 1955, 1,072,000 donations were collected.

In the 1954 calendar year 800,700 certificates were issued in first aid; 1,054,000 in water safety; 191,850 in home nursing and 26,000 volunteers took special training for assignments in chapters, hospitals, institutions, and other agencies. By mid-1955 there were 45,100 volunteer nurses enrolled for work in disaster and in other Red Cross and community programs of service. There was a substantial growth in volunteer service for patients in civilian mental hospitals. Trained volunteers served 120 civilian mental hospitals, 2,650 other civilian hospitals and 1,500 agencies and organizations.

Through arrangements with the Chinese Red Cross the first shipment of American Red Cross food and comfort packages for Americans held prisoner in Communist China crossed the border at Hong Kong in June. Deliveries were thereafter to be

made twice a month. These packages would supplement those sent by prisoners' next of kin, which were being delivered by the Red Cross in about one-third of the time formerly required through commercial channels.

Students in more than 75,000 elementary and secondary schools were enrolled in the Junior Red Cross. In addition to their service activities locally, they filled 400,000 gift boxes for shipment to children of other lands.

(C. L. B.)

International.—Membership in the International Red Cross increased to 73 national Red Cross, Red Crescent and Red Lion and Sun societies in 1955 as the result of the acceptance by the League of Red Cross societies of the Afghan Red Crescent and the Red Cross society of the Democratic Republic of Germany. Total individual membership stood at 60,153,614 adults and 14,771,132 juniors.

International disaster relief actions included aid for victims of fires in Beirut, Lebanon, and Istanbul, Turk., floods in Egypt, France, Sumatra, Australia, the United States, India and Pakistan, a hurricane over the Maldive Islands and an earthquake in Greece. The total value of international assistance was approximately \$500,000. National societies of these and other countries afflicted by calamities spent an additional \$7,000,000.

International Red Cross assistance to refugees in South Korea, South Vietnam and the near east was valued at \$500,000.

Barriers were lowered in several countries to permit the regroupment of families under Red Cross auspices, particularly of Greeks from Rumania to Greece, Canada, Australia and the United States, from Hungary to Greece and Canada, from Czechoslovakia and Yugoslavia to Greece, and of Japanese from the Soviet Union and Communist China to Japan. The total number of people involved was approximately 2,000.

In the medico-social field group, studies were published by the League of Red Cross societies on hospital libraries, water safety, mountain first-aid and rescue, accident prevention among children, recruitment of blood donors, treatment of burns and toxic poisoning caused by unignited aviation fuel and casualty making. In Sept. 1955, an International Red Cross meeting was held at league headquarters in Geneva, Switz., to perfect plans for Red Cross participation in the protection of the civilian population in case of war. At the same time, there were meetings of the league's Nursing Advisory committee and the Junior Red Cross Advisory committee grouping specialists in nursing and education from more than 30 countries.

During the year special training camps for about 300 Junior Red Cross members from 35 countries were held in Yugoslavia, Ireland and Canada.

On Sept. 1, 1955, Leopold Boissier succeeded Paul Ruegger as president of the International Committee of the Red Cross.

Refugees. Organized efforts to resolve the problem of refugees remaining in Europe continued during 1955 under the auspices of the Office of the United Nations High Commissioner for Refugees, the United States Escapee program, the Intergovernmental Committee for European Migration and the voluntary agencies. The Office of the High Commissioner for Refugees was originally established by the United Nations in Dec. 1950 and was continued in 1953 for a period of five years. G. J. van Heuven Goedhart (Netherlands) was re-elected high commissioner for the same term. The functions of the office are to provide legal and political protection for refugees and to seek permanent solutions for the problem by assisting governments and voluntary agencies to facilitate the voluntary repatriation of refugees or their assimilation in new countries

of residence.

In Oct. 1955 the high commissioner reported to the United Nations that 15 governments had ratified the Convention Relating to the Status of Refugees promulgated by the diplomatic conference convened by the general assembly of the United Nations at Geneva, Switz., in 1951. The convention, which came into force on April 22, 1954, codifies the rights of refugees and gives them status in international law. Among the rights and privileges accorded to refugees under the convention are the right to work and to join labour unions, status in the courts, participation in social security systems, freedom to travel, travel documents and public education for children.

During the period from 1947 to 1953, international efforts had been focused largely on securing the emigration of refugees from Europe to overseas countries of immigration. The International Refugee organization (1947-52) had resettled more than 1,050,000 refugees overseas. In 1953 and 1954 it became increasingly apparent that many refugees in Europe would not qualify for admission to countries of immigration and would of necessity, if not from choice, be obliged to re-establish their lives in the countries of their present residence in Europe.

In response to this need and consistent with his mandate, the high commissioner proposed to the general assembly of the United Nations in Oct. 1954 that a fund of \$12,000,000 be established to assist the integration of refugees in the economies of the countries of initial and secondary asylum in Europe. This effort was to continue over a period of four years after which it was assumed that the countries of asylum would be in a position to absorb the remaining refugees on their own resources. The general assembly acted favourably on the high commissioner's proposal and the United Nations Refugee fund was established. At the meeting of the Economic and Social council in Geneva in May 1955, the high commissioner's advisory committee of 15 governments was reconstituted as the United Nations Refugee Fund Executive committee and its membership enlarged to 20 governments. The executive committee established a budget of \$4,200,000 to be expended during the year 1955. The integration projects to be undertaken under the auspices of the fund in Germany, Austria, Italy, Greece and the near east were the establishment of refugees in agriculture and in small trades, businesses and professions, the building of houses, loans and scholarships for students and assistance in vocational training.

The U.S. Escapee program, initiated in 1952, continued during 1955 to assist new refugees arriving in Germany, Austria, Italy and Greece. While the flow of such refugees from eastern Europe diminished to approximately 450 monthly during the year, their needs were nonetheless acute, taking into account the burdens already carried by the countries of asylum in caring for the refugees remaining in their territories since the war. In Oct. 1955 the Escapee program had about 30,000 such refugees under care and had already resettled overseas more than 23,000. The assistance in care and maintenance, medical care and vocational and language training provided by the program was supplemental to that supplied by the countries of asylum. Emphasis was placed on the emigration of escapees for whom transportation was supplied by the Intergovernmental Committee for European Migration. The Escapee program depended heavily on the collaboration of the voluntary agencies in carrying out specific projects aimed at the early re-establishment of the escapees in useful employment either in Europe or abroad. Similar services were provided in Hong Kong both for European refugees permitted to depart from Shanghai and to a limited extent for Chinese refugees from the communist mainland.

The Intergovernmental Committee for European Migration, organized in 1951 at Brussels, Belg., on the initiative of the

United States, moved 121,222 migrants out of Europe in 1954 and expected to move 119,000 in 1955. Approximately one-third of the persons moved by the committee during the four years of its operations were refugees of various categories. More than 75,000 were under the mandate of the United Nations high commissioner. New Zealand and the Federation of Rhodesia and Nyasaland joined the committee in 1955, bringing the membership to 26 governments, including those of countries of emigration in Europe and countries of immigration in the western hemisphere. The purpose of the committee is to facilitate the emigration of persons, including refugees who would not otherwise be moved, from the overpopulated areas of Germany, Austria, Italy, Greece and the Netherlands to countries overseas where opportunities for employment and a less crowded existence are available. During 1955 more than 40% of the persons moved went to Australia, while Italy supplied the largest number of emigrants from Europe.

In addition to supplying ocean transport, the committee in co-operation with its member governments provides many technical services in the processing and reception of migrants and vocational training in specific industrial skills required by the immigration countries.

The constitution of the committee which came into force in Nov. 1954 was accepted by 23 of the member governments and gave the committee more formal status as a temporary committee with an anticipated life span of five more years.

The committee's budget for 1955 totalled \$42,697,030, divided in two parts: \$2,619,010 for administrative expenditure and \$40,078,020 for operational expenditure. Contributions to the administrative expenditure are obligatory on member governments. Contributions to the operational expenditure are voluntary. To an increasing degree, the migrants assisted were contributing to the financial costs of their transport.

The rising level of economic activity in Germany in 1954 and 1955 greatly assisted the German Federal Republic in the further integration of the German minority groups which were expelled from eastern Europe after the war and the more than 1,500,000 German refugees from the eastern zone of Germany. These expellees and German refugees have the full rights of German citizenship. The flow of refugees from the east zone was at the rate of 6,500 monthly during the first quarter of 1955 and increased to more than 20,000 monthly in October.

No substantial developments toward the establishment on the land of the 875,000 Arab refugees in the near east resulting from the conflict in Palestine during 1948 took place during the year. The United Nations continued to house and feed the refugees.

The movement of refugees from the communist Vietminh area to the south in Indochina continued during the year. Estimates of the total movement since the end of hostilities in the area were nearly 1,000,000 persons. (See also IMMIGRATION, EMIGRATION AND NATURALIZATION.)

Religion. A feature of 1955 which was a continuation of the previous year was the revival in some of the religions of Asia. That in Buddhism, as in recent years, centred in Burma. What was known as the sixth Buddhist council went

on with its task of establishing definitive texts of the core of the Buddhist sacred writings, the Tripitaka. Four of the preceding councils, convened for a similar purpose, had been in India and Ceylon before the time of Christ. What was regarded as the fifth had met in Mandalay in 1871. The sixth and current council was an enterprise of the Hinayana branch of Buddhism. It was aided by a substantial grant from the Ford foundation for the construction and equipping of a library. At the end of 1954 there assembled, also in Burma, what was known as the third biennial conference of the World Fellowship of Buddhists. It continued into 1955. To it came not only representatives of Hinayana, the wing of Buddhism which prevailed in Ceylon, Burma and Thailand, but also some from Mahayana, the predominant form in Japan, China and Korea. For it the government of Burma provided physical facilities. Part of the equipment was a huge assembly hall erected to look like a cave. There was also a World Peace pagoda. Many Buddhists were saying that since the great wars of the 20th century had sprung from the occident, Christianity, as the presumed faith of that region, had failed to prevent them and that in Buddhism was the hope for world peace.

Some Moslems were making a similar claim for Islam. They too, asserted that Christianity had been proved incapable of bringing peace and declared that in Islam was the way to its achievement. Islam was making numerical and geographic gains. These were chiefly among animistic peoples in Africa south of the Sahara.

In Hinduism there was something of a revival. One phase of it was seen in Vinoba Bhave. A Hindu representing the Gandhian tradition, he travelled through India, as he had earlier, urging landowners to give up some of their land for redistribution among the landless. On the other hand, Bhimrao Ramji Ambedkar, an educated leader of the "outcastes," was trying to win them to Buddhism rather than have them assimilated to Hinduism.

Although the Communists were atheists, in China, to win favour with the Tibetans, they were refurbishing the Lama temple in Peking and in other ways were encouraging the form of Buddhism professed by the Tibetans.

As had been true since World War II, in Japan some of the Shinto sects flourished, especially those which stressed the healing of disease by faith.

It must be noted, however, that the revivals in the Asiatic religions were displayed only among minorities. Secularism which had entered with other currents from the occident, was very widespread. The decay of Buddhism and Taoism in China and of Buddhism in Korea, which had been in progress for cen-

CHURCH TRIAL COMMITTEE AND RECORDERS at heresy trial of Lutheran minister in Milwaukee, Wis., July 1955

juries, continued. In China and North Korea it was accelerated by the dominance of communism. In China and Korea Confucianism, once the faith of the educated, had been losing its grip through much of the 20th century, especially after the collapse of the monarchy in China in 1911-12. In China and North Korea communism was dealing it additional blows. Buddhism in Japan had not recovered from the losses in the endowments (largely in cultivated land) of its temples and monasteries, brought by the breakup of the large holdings by the occupation after World War II. It was also significant that in several countries the renewed loyalty to the hereditary religion was closely associated with heightened nationalism and was from patriotic as well as religious conviction. That was true, for example, of Islam in Egypt and of Buddhism in Ceylon and Burma.

The progressive weakening of animism among the peoples of Africa south of the Sahara should also be noted. This was the result of the rapid disintegration of the tribal and family life and the other inherited mores wrought by the impact of European civilization, the growth of cities and the recruiting of labour for work in the mines.

In Iran the persecution of Baha'i continued. It will be remembered that Baha'i had its origin in Iran as an outgrowth from Islam. For several years pressures had been brought against it in the land of its birth.

For Christianity the record of the year was somewhat mixed. On the whole was one of gain. On the negative side was an increasing tension in Spain between the Roman Catholic Church and the Falange. More spectacular was the conflict in Argentina between the Roman Catholic Church and Pres. Juan D. Perón. Perón, dominant in the government, denounced the church and threatened it with disestablishment. The church excommunicated Perón. (A revolt in Sept. 1955 forced him out of office.)

Sobering, too, was the action in Roman Catholic Belgium by an administration controlled by Socialists and liberals in reducing state subsidies to church schools and strengthening the public schools. On the other hand, in a Eucharistic congress held in Brazil, bishops in attendance from various parts of the world took steps to improve the condition of the Roman Catholic Church in South America by appealing for more priests from Europe. The church in South America had too few clergy to care for its constituency. Here was an effort to remedy the deficiency. In the U.S.S.R. the Kremlin, although in the hands of the officially atheistic Communist party, was less intransigent toward religion than formerly. It was showing more respect for the officials of the Orthodox Church and was permitting representatives from churches outside the "iron curtain" to send messages and visitors not only to the Orthodox Church but also to the Baptists. It allowed some of the latter to attend a meeting in London of the Baptist World alliance.

In the Netherlands the Dutch Reformed Church adopted a new confession of faith, the first since the 17th century. The U.S. evangelist, Billy Graham (*q.v.*), followed up the meetings which he had held in London in 1954 with a campaign in Scotland which attracted much attention. Addresses by him on the continent of Europe were given wide publicity.

In the United States the increase in church membership continued. The latest figures, those for 1954, showed a total of 177,482,611, more than the previous year by 2,639,766. Of the approximately 97,000,000 about 57,000,000 were Protestant, 22,000,000 Roman Catholic and 2,500,000 Jewish. This was 60.3% of the population, the first time that the proportion had risen above 60%.

In August the World's Young Men's Christian association celebrated in Paris the centennial of the formation of its World's Alliance. The World Council of Churches in association with the International Missionary council followed up the program

STAINED GLASS WINDOW AND ALTAR of prayer room in the capitol, Washington, D.C., opened in 1955 for the exclusive use of U.S. congressmen

adopted at Evanston, Ill., in 1954, and in the meeting of its central committee in Switzerland in the summer admitted additional churches to membership.

Religious Education. Protestant and Orthodox.—A study conference on religious education took place in Indonesia in the early summer of 1955, when 70 delegates representing practically all of the Protestant churches in those islands came together at Sukabumi, near Djakarta, for three weeks under the auspices of the Theological Commission of the Indonesian Council of Churches and the World Council of Christian Education and Sunday School Association. The findings of this conference were to be published in the Indonesian language as a handbook on Christian education for the churches of that country.

Several thousand Protestant and Orthodox Sunday school teachers and workers from the United States and Canada gathered at the 23rd International Sunday School convention at Cleveland, O., in late July. Visiting delegates attended from the Philippines, West Pakistan, Egypt, Great Britain and Mexico.

The development of indigenous curriculum materials for use in the Christian education programs of the churches in the mission fields continued to be given major emphasis. Nationalist and independence movements in Africa and Asia were resulting in the transfer of day schools in many countries from church control to the control of the secular authorities. This had happened or was happening in some degree in Ceylon, India, the Gold Coast, Nigeria, South Africa, Southern Rhodesia and the Belgian Congo. It therefore became urgently necessary to build

strong Christian education programs in the local churches through Sunday schools and youth groups.

Protestant and Orthodox delegates from eight countries of the near east were invited to attend two official curriculum conferences in September and October in Egypt and the Lebanon, respectively.

Four preliminary conferences on curriculum development and leadership education for Christian education in Africa were planned for Dec. 1955 and the first three months of 1956. The conferences were to be held in east, west, central and southern Africa and 17 countries were involved.

An international team representing the Philippines and Canada planned to visit Nigeria in the latter part of 1955 and the first six months of 1956 to study Sunday school and youth programs in the local churches and to assist local leaders in Africa to give a training course to about 25 young Nigerians who were to be used to promote Sunday school and youth work in the churches of that country.

The Youth committees of the World Council of Christian Education and the World Council of Churches met at Princeton Theological seminary, Princeton, N.J., early in 1955 to consider requests from youth groups in 20 countries around the world for participation in international projects.

The World's alliance of the Y.M.C.A. celebrated its 100th anniversary at a conference in Paris in Aug. 1955. (N. CL.)

Roman Catholic.—In 1955 the 1,557 diocesan and parochial high schools in the United States reported 398,192 pupils; the 842 private secondary schools reported 241,418. Pupils in the 8,843 parish elementary schools numbered 3,253,608. Enrolment in the 542 private elementary schools reached 95,685. These figures represented a substantial increase over those of 1954: 23,093 for the first group, 13,518 for the second and 4,442 for the third. The number of children cared for in 328 protective institutions rose from 20,148 to 35,147.

Enrolments in the 247 Catholic colleges and universities totalled 219,706 in 1955, an increase of 8,786 over 1954. The 78 diocesan seminaries reported 9,539 students and 385 novitiates and scholasticates of the various orders and congregations were preparing 16,493 candidates for the priesthood.

Catholic schools of nursing accounted for 30% of all nurses graduated in the United States and its territories, with a total of 8,812 graduates. There were 334 state-approved Catholic schools of nursing, 43 of which were colleges offering basic degree programs; 291 were schools with three-year diploma programs, the majority of which were under hospital control.

Archbishop John F. O'Hara of Philadelphia, formerly president of Notre Dame university, Notre Dame, Ind., stated in a front-page editorial, July 29, 1955, in the *Catholic Standard and Times*, that Catholics in the United States contribute more than \$1,000,000,000 each year in taxes to the public schools of the country, a sum which is only part of their outright "gift" to public education.

Foundations to aid education recognized Catholic colleges in their 1955 programs. The Ford Fund for the Advancement of Education awarded Manhattan college, New York city, a grant for a self-survey of its operations. The Ford fund awarded six fellowships and the Guggenheim foundation four to Catholic university faculty members. The Rockefeller foundation granted the University of Notre Dame \$100,000 to support its research in international relations. (J. LAF.)

Jewish.—The year 1955 witnessed continued effort and progress in religious and cultural life throughout the Jewish world. Among the notable efforts and accomplishments were the establishment of a number of colleges and teacher training schools in America, in Europe and in Israel.

In New York city, a liberal college for girls known as Stern

college was opened as an extension of Yeshiva university. The primary purpose of Stern College for Women is to provide young women with an education in the liberal arts and sciences as well as a grounding in Jewish learning and traditions.

An institution of higher learning named Bar-Ilan university was dedicated on Aug. 27 in Ramat Gan, Israel. Sponsored by the Mizrahi Organization of America, the university is devoted to a study of traditional Judaism, combined with a full course in higher general education following the pattern of American colleges.

Hebrew Union college-Jewish Institute of Religion of Cincinnati, O., and New York city announced, on the observance of its 80th anniversary, the opening of a graduate school in Jerusalem which would foster Jewish learning along liberal religious lines in keeping with the policies of Hebrew Union college-Jewish Institute of Religion.

To meet the increased need for religious teachers in Jewish communities in Europe, South America and North Africa, the department of education and culture of the Jewish agency in Jerusalem opened an institute for the training of teachers, named after the American Zionist leader, Chaim Greenberg.

To advance the study of modern Hebrew in Jewish communities and in general high schools and colleges, representatives from 30 countries attended a Hebrew congress in Jerusalem during the summer. One of the notable resolutions adopted by the congress was an appeal to the U.S.S.R. to remove current restrictions against religious education and the study of Hebrew in the Soviet Union and the satellite states.

In America, Jewish religious education continued to make progress, particularly in enrolment of new students. As in previous years, religious schools experienced a great shortage of teachers. To cope with this problem, the American Association for Jewish Education resolved to call a national conference in 1956 with a view of stimulating greater interest in the profession of Jewish education. Respiratory Diseases. **Psittacosis.**—By 1955, psittacosis was becoming a problem of increasing importance in the United States. Popularly the condition is known as parrot fever because the disease, and the virus which causes it, were first recognized as being transmitted to humans from parrots and other psittacine birds. The same or closely related viruses are prevalent among all birds including chickens and street pigeons. In 1951, the U.S. public health service had relaxed the interstate and foreign quarantine regulations for psittacine birds. A great increase occurred in the number of such birds, particularly parakeets, sold as household pets in the United States. Coincidentally the number of cases of psittacosis reported rose considerably. Only 20 to 30 cases were reported annually to the national office of vital statistics of the public health service for 1945 through 1951; the number thereafter steadily increased.

During 1954, cases were reported from 29 states and the District of Columbia. Eight states each reported 15 or more cases. Texas and California reporting 151 and 56, respectively. In Texas 149 cases were among employees of several poultry processing plants and the viruses isolated from turkeys were also associated with some of these plants. Pigeons, and possibly chickens, were also involved as the source of infection of

number of human cases. The total reported in the weekly *Communicable Disease Summary* for 1954 was 445, but the final figure for that year on an annual basis was expected to be greater. During 1955, as many as 10 cases were reported each week in these summaries. Most cases of psittacosis are probably not reported because other diagnoses, particularly primary atypical pneumonia or virus pneumonia, are made.

Influenza.—Dorland J. Davis, chief of the laboratory of infectious diseases of the National Microbiological Institute, briefly reviewed the occurrences of influenza epidemics in the United States and elsewhere in recent years in relation to the types of influenza viruses that caused them.

The changes in the specificity of the strains of influenza viruses that cause epidemics in different years had been shown to be reflected in the types of antibody that could be demonstrated in groups of individuals following vaccination with vaccines containing only single specific individual strains. When children, whose initial exposures had been only to recent so-called A prime strains (the term applied to strains of influenza A isolated in 1947 and thereafter), were vaccinated with a single strain of one of the A viruses, they showed marked increases in antibodies to the A prime strains and little or no increase in titer to the A strains that caused epidemics prior to 1947 unless they had been vaccinated with such strains. When sera from individuals of different age groups were tested with prototype strains, marked rises in titers were found in a few children to some strains that caused outbreaks in 1935 or earlier after vaccination with A prime strains; this was interpreted as indicating a limited prevalence of infections with viruses that resembled the earlier strains. Persons over 30 years old frequently responded with rises to the earlier type A strain regardless of the strain used in the vaccination, and, by contrast, some individuals were found who were considered to have escaped experience with the earlier viruses during periods when they were prevalent.

When antibody levels with the same prototype strains of influenza viruses were compared in sera collected during 1953 from persons in Sheffield, Eng., and in Michigan, it was found that: (1) similar shifts in the dominance of the types comprising the group A viruses occurred in both countries at the same time; (2) the levels of antibody were considerably lower in Sheffield but there was less difference to some viruses than to others, and (3) the lower levels of composite antibody titers in Sheffield correlated with and helped explain the higher incidence of influenza in England.

T. Francis Jr., recently summarized the current status of the control of influenza. He felt that the results of studies on vaccination with inactive influenza viruses demonstrated their high effectiveness. Reactions were few but persons naturally sensitive to eggs or chickens should not be given the vaccines, which are prepared in chick embryos. He felt that he could with confidence suggest a broader use of the vaccine and that it could sharply reduce the risk of influenza and other respiratory disorders which may accompany or follow it. Unfortunately, in spite of his wide experience not many shared his confidence in these vaccines, and they had not achieved general acceptance, but were reserved for special groups of individuals in whom protection against influenza was very important.

Common Cold and Other Acute Respiratory Infections.

—While no progress was reported on the isolation of the causative agent of the common cold, information had been accumulated about certain other viruses isolated in tissue cultures which seemed to be causally related to infections of the respiratory tract. R. J. Huebner, W. P. Rowe and their co-workers at the National Institutes of Health isolated a group of new viruses in tissue cultures from adenoid and tonsillar tissues removed

surgically, from secretions of the nose, throat and conjunctivae and from feces of persons with respiratory illnesses; they designated them as adenoidal-pharyngeal-conjunctival (APC) viruses. These viruses were grown from tissues which contained specific antibodies against them, merely by prolonged periods of incubation.

By the end of 1954 these workers had segregated 143 strains of such viruses into six specific types all of which grew readily in cultures of certain types of human cells. All six types were shown to be the cause of frequent infections in humans, beginning at an early age. Antibody studies in Washington, D.C., indicated that 50% of infants 6 mo. to 1 yr. of age had already been infected by at least one type; by the age of 15, the average person had already been infected by several types; and most persons had antibodies to four or more types by the age of 34.

They also produced some evidence that two of the types produce specific types of illness, one of these, type 4, corresponding to a type designated RI67 that was isolated by workers in the army medical school. The other, type 3, was recovered from many cases of acute nasopharyngitis and conjunctivitis during a winter outbreak in a hospital ward and a summer outbreak in a country day school; this type seemed to be established as a well-defined clinical entity.

In studies in Cleveland (O.), sera obtained from donors of infectious respiratory secretions and recipients of these secretions during a human transmission experiment carried out in 1945 were studied for antibodies to the RI67 and some of the APC viruses. The results indicated that the acute respiratory disease in those studies was caused by an agent that was either identical with, or closely related to the RI67 agent, and that this infection was distinct from the common cold and from primary atypical pneumonia. Other viruses, distinct from RI67, were also responsible for cases of this disease. Agents similar to the APC viruses, however, were recovered from cases of non-bacterial infections in the civilian population of Cleveland in July and Aug. 1954; type 3 was the virus predominantly implicated, but at least one other type was involved.

The present status of the prevention of the common cold and uncomplicated respiratory infections was recently summarized by J. H. Dingle. He indicated that no truly effective methods were yet available for the prevention of the great majority of respiratory diseases caused by viruses. He expressed real hope, however, that such measures would emerge from continued studies of the new respiratory viruses and those of measles, chicken pox and others and from the search for agents which kill them or inhibit their growth.

Histoplasmosis.—This fungous infection which is caused by *Histoplasma capsulatum* had received a great deal of attention in recent years because it produces lesions in the lungs resembling those of tuberculosis for which it is often mistaken. Most of the infections are recognized by a skin test with histoplasmin, a product of the causative fungus, in the same manner that tuberculosis infections are uncovered by skin tests with tuberculin. The fungus was isolated from soil and also from domestic animals, including dogs, cats and horses and from wild animals living in the proximity of human habitations.

At the 14th Conference on the Chemotherapy of Tuberculosis of the Veterans Administration, Army and Navy, evidence was presented which emphasized the importance of histoplasmosis as a problem in sanatoriums devoted to the treatment of tuberculosis. Two groups of workers discovered that about 2.2% of cases considered to have advanced tuberculosis with cavities in their lungs actually had active histoplasmosis, proved by examinations of specimens of lung or by cultivation of the fungus, and about 5.3% probably had this disease as evidenced by positive skin tests with histoplasmin or by finding antibodies

in the blood. It was estimated that about 1,300 such cases would be found in tuberculosis sanatoriums in the areas of high prevalence of histoplasmosis.

The treatment of histoplasmosis had not been satisfactory. Success was reported in an isolated case of localized histoplasma infection of the hard palate and gingiva by the use of 2-hydroxystilbamidine. As with many other infections, there was the possibility of increasing the dissemination of histoplasma infections widely throughout the body when cortisone or similar adrenocortical hormones were given, especially in large doses for prolonged periods; this was demonstrated experimentally in guinea pig infections.

This French overseas island *département* in the Indian ocean has an area of 969 sq.mi. Pop.: (1946 census) 241,708; (1954 census) 274,370 (French Creoles, Negroes, mulattoes, Indians and Chinese). Language: French and Creole French. Religion: mainly Roman Catholic. Chief towns (pop., 1950 est.): St. Denis (cap.) 39,057; St. Paul 27,585; St. Pierre 24,652; St. Louis 23,925. Prefect in 1955, Pierre Philip.

History.—Marcel Cerneau and Georges Repiquet, both Radicals, were elected to the senate. Sugar production rose, so that a favourable adjustment of the balance of trade was possible.

(Hu. DE.)

Foreign Trade.—(1954) Monetary unit: franc C. F. A. (Colonies Françaises d'Afrique) = 2 metropolitan francs. In 1955 U.S. \$1 = 350 metropolitan francs. Imports 6,400,000,000 fr. C. F. A., including 4,400,000,000 fr. C. F. A. from France; exports 6,200,000,000 fr. C. F. A., including 5,000,000,000 fr. C. F. A. to France. Production (1954): sugar 175,000 metric tons; vanilla 52 metric tons; rum 87,000 hl.

Reuther, Walter Philip (1907–), U.S. labour leader, was born Sept. 1 at Wheeling, W. Va. After working in steel and automobile plants he and his brother Victor began in 1933 a tour of 11 European and Asiatic countries, working as labourers and studying various national labour movements, including that of the U.S.S.R. He returned home in 1935 and the following year was elected to the international executive board of the United Automobile Workers union. In 1942 he was elected vice-president and in 1946 president. On April 20, 1948, unidentified assailants seriously wounded him with a shotgun blast.

In 1949-50 Reuther's U.A.W. won substantial workers' pension concessions from the major automobile manufacturers. On Dec. 4, 1952, Reuther was elected president of the Congress of Industrial Organizations to succeed Philip Murray (1886-1952). As C.I.O. president Reuther became actively critical of the Eisenhower administration's labour policies, especially after the resignation of Martin P. Durkin as U.S. secretary of labour on Sept. 10, 1953. Meanwhile negotiations had been under way for a merger of the C.I.O. with the American Federation of Labor, leading to a final agreement in Dec. 1955, under which George Meany (*q.v.*) of the A.F. of L. became president of the new federation, named the American Federation of Labor and Congress of Industrial Organizations. Reuther was elected president of the industrial union department of the combined A.F. of L.-C.I.O. organization. Reuther in 1955 again won important wage concessions for the automobile workers, this time in the form of guaranteed annual wages.

Rheumatic Diseases. During 1955 considerable sums of money were appropriated by the United States congress to support an expanding program of research in this field, and a committee of the United Nations' World Health organization turned its attention to rheumatic diseases with a view to bringing to bear the energies and facilities of the entire world.

Bacterial Infections of Joints.—Highly successful measures had been developed for treatment of bacterial infections. Incidence of streptococcal and staphylococcal infections of joints was low because of the effective use of new agents in their treatment. Steadily improving control measures were wiping out other contagious diseases which in former years had also resulted in bacterial invasion of joints. Included among these were arthritis of scarlet fever, arthritis of cerebral spinal fever (spinal meningitis), arthritis of typhoid fever and arthritis of bacillary dysentery.

Still resistant to these new agents, however, were bacterial

forms of arthritis caused by brucellosis and tuberculosis, and arthritis caused by some highly dangerous yeast and mouldlike organisms.

Rheumatic Fever.—Although the causes of rheumatic fever remained unknown, mounting evidence pointed to streptococcal infections as a major factor in bringing on this disease. Prompt treatment of initial streptococcal infections with potent antibiotic agents was encouraged, as were daily injections of small prophylactic amounts of penicillin or one of the sulfonamide drugs for susceptible persons. By means of infrequent injections of long-acting repository penicillin, levels of penicillin in blood sufficiently high to reduce incidence of streptococcal infections were achieved. An injection once each month for two years completely protected 400 patients recently recovered from rheumatic fever.

Treatment of Acute Rheumatic Fever.—Hormones of the pituitary and adrenal glands were known to exert a powerful and dramatic suppressive effect upon inflammatory manifestations of rheumatic fever. Nevertheless, sharp divisions of opinion remained among physicians as to whether these hormones were in fact capable of lessening those complications of rheumatic fever which are most serious of all, that is, inflammation of the heart muscle and heart valves.

A relationship between glands of internal secretion and rheumatic fever was further suggested by finding unusually high levels of adrenal hormones circulating in the blood during the first week of the disease. After the ailment became well established, less than the normal level was found to be present. This phenomenon was now under intensive study.

A new test of the presence of rheumatic fever, C-reactive protein, was being widely used to provide a sensitive and reliable gauge of rheumatic activity. The test was especially satisfactory among individuals having no other inflammatory process.

Rheumatoid Arthritis.—Persons affected by this condition were believed to react abnormally to certain stimuli including infections, emotional stresses, trauma, exposures, fatigue and even some nutritional deficiencies. Exposure to these stimuli was thought to cause an alteration in the molecular structure of connective tissue components, also overgrowth of connective tissue elements. Among persons with rheumatoid arthritis, connective tissues of joints were thought to react with special violence to these stimuli, causing the arthritis. Many compounds were studied in an attempt to find a substance able to suppress this abnormal reaction of the connective tissues. Nitrogen mustard compounds were being studied in this regard but severe reactions sometimes followed their administration and limited a study among human patients.

Although rheumatoid arthritis is generally looked upon as a disease of the joints, new researches uncovered information pointing to serious defects also being present in many other structures of the body. Signs of severe damage were found in arteries in certain instances, also extensive defects in the heart, liver and kidneys. Among some such patients these visceral lesions were of surpassing importance, causing dangerous ailments of themselves and, in some cases, causing deaths. Although rheumatoid arthritis was seldom listed as a cause of death, mortality rates among persons with this disease were higher than among the general population. This higher rate was especially evident among younger persons. Valvular heart disease, infections of all sorts, kidney disorders and formation of clots in the great vessels of the lungs were notably frequent.

New developments in treatment of rheumatoid arthritis generally reflected the view that this ailment is a systemic one; hence measures aimed at the joints alone could not be expected to succeed. Most writers agreed that active manifestations of

rheumatoid arthritis were reversible and that patients could often achieve a degree of control with presently available treatments. The orthodox measures generally recommended included regulated periods of rest and activity, orthopaedic exercises aimed at correcting and preventing deformities, physiotherapy and well-balanced diets.

Among agents under special study to supplement these measures were a number of new steroid compounds. Synthetic derivatives of cortisone containing fluorine were tested and found to have enormous antirheumatoid arthritis potency when compared with cortisone and hydrocortisone. At the same time these compounds showed great tendencies to cause water-retention and arterial hypertension. New synthetic crystalline steroid compounds designated prednisone and prednisolone had survived preliminary clinical tests and were being widely used in place of cortisone and hydrocortisone. These compounds exerted beneficial effects similar to those obtained with cortisone and hydrocortisone and had the advantage of causing less of a tendency toward retention of sodium and water. A rather high incidence of other side effects with these compounds was, however, causing some concern as to their long-term usefulness. In particular, appearance of a round fat face, peptic ulcers, disorders of sugar metabolism, a tendency toward diabetes mellitus, and occurrence of fractures attributable to osteoporosis were reported in numerous cases.

Among many other measures being tested for the treatment of rheumatoid arthritis were the administration of gold by the oral route, transfusions of blood from pregnant women, and injections of solutions containing a derivative of bile-salt, namely triketocholanic acid. Phenylbutazone was being employed widely for the relief of painful symptoms in various musculoskeletal disorders including rheumatoid arthritis, but a rather high degree of toxicity prevented prolonged administration in doses large enough to produce notable relief.

Osteoarthritis.—This ailment, a frequent and painful accompaniment of the advancing years of life, appears to originate as a degenerative disturbance of articular cartilages in certain areas of the body. A specific liability to this disorder appears to reside in the end joints of fingers, in hips, knees and in certain portions of the spine. During the year an ailment resembling human osteoarthritis was produced in rats by administering large amounts of anterior pituitary growth hormone. After treatment with this substance for approximately a year, knees, ankles and spinal joints showed advanced osteoarthritic-like changes. These animal studies had not established with certainty that the human disease is produced by the same mechanism; however, such studies opened pathways for research by indicating one manner in which a similar ailment may be brought about.

No significant developments regarding treatment of osteoarthritis were recorded during 1955. (See also HEART AND CIRCULATORY DISEASES.)

(E. F. RG.)

Rhode Island. A north Atlantic state of the United States, in New England. Rhode Island was one of the 13 original states; it is popularly known as "Little Rhody." Area: 1,214 sq.mi. (smallest of the United States), including 157 sq.mi. of water, 67% woodland. Pop.: (1950 census) 791,896; (July 1, 1955 est.) 814,000. The principal cities, with 1950 populations, were: Providence (cap.) 248,674; Pawtucket 81,436; Woonsocket 50,211; Warwick 43,028; Newport 37,564; Central Falls 23,550.

History.—In 1955 the state again suffered severe hurricane damages, as it had the previous year. This time, in August, the rains brought by Hurricane "Diane" resulted in flood waters pouring through the city of Woonsocket as the Blackstone river

overran its banks, climaxed by the bursting of Horseshoe dam and the emptying of extensive Harris pond directly into the city. One life was lost and property damage alone was estimated at \$25,000,000.

The most important measures enacted during the 1955 session of the state legislature were as follows: five major appropriation acts including \$54,033,662.18 to conduct the operation of the government during the fiscal year ending June 30, 1956, a supplementary \$2,500,000 from reserve for the state's share of general public assistance costs, an additional \$1,900,000 for increased aid to local public school systems, \$596,100 as partial reimbursement to general voluntary hospitals for services available to citizens, and \$2,134,159.12 to cover an anticipated deficiency for the fiscal year ending June 30, 1955; an act continuing for another year the increased tax program initiated in 1951; three acts submitting for public approval at the general elections of Nov. 1956 the issuance of bonds for \$30,000,000 for modernization and improvement of the state highway system, \$5,000,000 for the development and improvement of the facilities of the University of Rhode Island, and \$10,000,000 to provide for the payment of bonuses to residents who served in the armed forces during the Korean hostilities; an act requiring annual state or independent postaudits of the financial records of all local governments; an act creating three local health districts with a view to improving and expanding available public health services through co-operative state-local administration and financing; an act establishing controls over the sale of barbiturates and other hypnotic and somnifacient drugs; an act requiring that local governments provide for the education of retarded children through special classes; a series of acts substantively altering the state's employment security program by reducing compulsory unemployment compensation and sickness compensation coverage from those persons working for an employer of four or more to those working for an employer of one or more, by increasing the maximum weekly benefits from \$25 to \$30, by increasing the annual salaries taxable from \$3,000 to \$3,600 and by providing for the inclusion of state employees within the benefits of the unemployment program. The legislature also passed an act providing for public approval for the calling of a constitutional convention to consider three propositions, life tenure for judges of the supreme and superior courts, pay increases for state legislators and authority for cities and towns to redevelop and rehabilitate blighted areas; after subsequent voter approval, the convention which was called proposed three amendments which concurred with the propositions noted above; at the next polling, the electorate approved only the amendment granting local redevelopment powers.

The chief executive officers of the state elected in Nov. 1954 for 1955-56 were Dennis J. Roberts, governor; John S. McKiernan, lieutenant governor; Armand H. Coté, secretary of state; William E. Powers, attorney general; Raymond H. Hawksley, general treasurer. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1954-55 there were enrolled in the public elementary and pre-elementary schools 77,194 pupils and 2,671 teachers; in junior high schools 18,941 pupils and 907 teachers; in senior high schools and vocational schools 18,073 pupils and 980 teachers. Pupils attending private schools numbered: elementary and pre-elementary 31,340; junior high 5,482; senior high and business 7,349. The total number of teachers in private day schools was 1,478. Current expenditures for day schools in 1953-54 were \$25,006,830 and for evening schools \$81,752. The commissioner of education in 1955 was Michael F. Walsh, working under the state board of education of seven members whose chairman was C. B. Collins.

Social Insurance and Assistance, Public Welfare and Related Programs.—There were 30,611 persons receiving some type of direct monetary public assistance as of Aug. 31, 1955, this number being 844 less than the previous year. During the year Sept. 1, 1954, to Aug. 31, 1955, the total amounts paid out in the different categories were as follows: old-age assistance \$5,690,415; aid to dependent children \$4,470,561; general public assistance \$3,814,479; aid to the blind \$152,163; aid to the disabled

\$1,228,033; soldiers' welfare \$273,908. In June 1955 there were 54,643 persons receiving federal old-age and survivors insurance at a monthly rate of benefits totalling \$2,959,801. During the year ending June 30, 1955, 728,908 benefit payments amounting to \$16,181,113 were made from the unemployment compensation fund, receipts into which totalled \$16,263,614. In the same period 251,487 payments totalling \$5,752,550 were drawn from the temporary disability fund (i.e., for those unemployed because of illness); receipts amounted to \$5,756,969. On July 31, 1955, there were 668 inmates in corrective institutions and 5,645 patients in charitable institutions and institutions for defectives, the number in the latter being 4,327.

Communications.—In Oct. 1955 the total highway mileage (excluding roads and streets under the control of the seven cities) was 2,680 mi., of which 1,382 mi. were in the state highway system with 876 mi. thereof having been built by the state. In Oct. 1955 railroads were operating 185.2 mi. of track in the state.

Water-borne commerce of the state for 1953 totalled 8,129,000 tons, of which 959,700 tons were foreign commerce (imports 954,062 tons, exports 5,638 tons); 6,573,519 tons were coastwise (receipts 6,041,314 tons, shipments 532,205 tons).

As of Oct. 1955 there were four publicly owned (state) airports and seven privately owned airports or landing fields. There were also two naval air stations owned by the United States.

Banking and Finance.—There were 22 banking institutions in 1955. Resources of 16 banks under state supervision totalled \$777,955,487; those of 6 banks under federal supervision totalled \$499,532,012. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 16 state banks) amounted to \$457,000,104 on June 30, 1955. In addition, 6 loan and investment companies had resources of \$6,612,967; 7 building and loan associations \$144,299,051; 61 credit unions \$37,471,231. The state closed its fiscal year on June 30, 1955, with receipts totalling \$67,211,154.23 (including federal grants of \$10,004,836.93); expenditures and encumbrances \$67,889,244.09; operational deficit \$678,089.86; free surplus \$7,017,347.16. The state gross debt was \$64,917,000; net debt \$58,234,909.52.

Agriculture.—The estimated total acreage of principal crops harvested in 1955 was 47,120. Cash income from crops in 1954 was \$7,318,000; from livestock and livestock products \$17,540,000; from governmental payments \$55,000; total gross farm income \$24,913,000. The estimated value of livestock on Jan. 1, 1955, was \$5,954,000, excluding turkeys and commercial broilers.

On Jan. 1, 1955, the livestock population of the state included 1,000 horses and colts; 21,000 milk cows; 8,000 other cattle; 5,000 hogs and pigs; 2,000 sheep and lambs; 615,000 chickens; and 5,000 turkeys. Livestock products in 1954 included 156,000,000 lb. of milk valued at \$10,215,000; 4,928,000 lb. of chickens, \$948,000; 4,853,000 lb. of commercial broilers, \$1,136,000; 922,000 lb. of turkeys, \$361,000; 8,833,000 dozen eggs, \$4,275,000.

Table I.—Leading Agricultural Products of Rhode Island

Crop	Indicated 1955	1954	Average, 1944-53
Corn, all, bu.	360,000	231,000	310,000
Hay, all, tons	56,000	51,000	48,000
Alfalfa hay, tons	7,000	7,000	3,000
Potatoes, bu.	1,155,000	1,148,000	1,323,000
Apples (commercial), bu.	245,000	165,000	181,000
Peaches, bu.	19,000	17,000	16,000

Industry and Manufacturing.—The estimated number employed in the state in Aug. 1955 was 297,800, which was 12,700 more than in Aug. 1954. Employment was distributed as follows: manufacturing 132,700; trade (wholesale and retail) 53,200; government (federal, state, local) 35,300; service personnel, medical, legal, etc. 29,100; transportation and public utilities 15,700; construction 18,300; finance, insurance, real estate 12,700; miscellaneous 800. (Farmers, self-employed, domestics and armed service personnel are excluded.)

Employment in manufacturing in Aug. 1955 totalled 132,700, which was 5,366 more than in Aug. 1954, and the weekly payroll was \$6,590,500 for all manufacturing industries in Rhode Island according to the state department of labour. Wage earners were distributed among the manufacturing industries as follows: textiles 39,100; jewellery-silverware 24,400; metals and machinery 32,600; rubber products 5,400; apparel 4,000; optical products 4,000; food 4,800; miscellaneous 18,400. The average weekly earnings for all manufacturing employees were \$60.35, hourly earnings average \$1.54. (Jo. C. M.)

Mineral Production.—Rhode Island's mineral production ranked 47th among the states in value of output in 1953, and included principally building materials. Data for 1954 were not available in 1955, but outputs in 1952 and 1953, respectively, included: sand and gravel 589,000 tons (\$557,000) and 898,000 tons (\$776,000); stone 169,000 tons (\$655,000) and 162,000 tons (\$617,000); other nonmetallics valued at \$38,000 and \$69,000; total value \$1,250,000 and \$1,462,000.

Rhodesia and Nyasaland, Federation of.

This is a federation of three British central African countries: Northern Rhodesia, protectorate (north of river Zambezi); Nyasaland, protectorate (east of Northern Rhodesia); and Southern Rhodesia, self-governing colony (south of the Zambezi). The federation is bounded north by Tanganyika and the Belgian Congo, south by Bechuanaland and the Union of South Africa, west by Angola and east by Mozambique. Area: 489,854 sq.mi.; pop. (1955 est.) 7,072,000. Language: English, tribal dialects and (in Southern Rhodesia) Afrikaans. Religion: pagan, with Christian minority. Federal capital, Salisbury, S.Rhod. Governor general in 1955, Lord Llewellyn; federal prime minister, Viscount Malvern.

Northern Rhodesia.—Area: 290,323 sq.mi., including 3,000 sq.mi. of lakes. European pop. (1951 census) 40,842; total pop. (mid-1955 est.) 2,128,000, including 62,000 Europeans. Chief towns (pop. 1953 est.; European pop. in parentheses): Lusaka (cap.) 62,000 (6,000); Kitwe 60,926 (6,300); Luanshya 54,127 (4,727); Ndola 44,120 (5,120); Mufalira 41,668 (4,247); Chingola 34,484 (3,384); Broken Hill 32,810 (4,050). Governor in 1955, Sir Arthur Benson.

Nyasaland.—Area: 49,177 sq.mi., including 11,600 sq.mi. of lakes (mainly Lake Nyasa, which runs along much of the eastern frontier). Pop. (1945 census) 2,049,914, including 1,948 Europeans; (1955 est.) 2,545,000, including 5,600 Europeans. Chief towns (1952 est.): Zomba (cap.), pop. about 5,000; Blantyre about 17,000. Governor in 1955, Sir Geoffrey Colby.

Southern Rhodesia.—Area: 150,354 sq.mi. European pop. (1951 census) 135,596; total pop. (1955 est.) 2,399,000, including 166,000 Europeans. Chief towns: Salisbury (cap.), pop. (1953 est.) 120,000, including 50,000 Europeans; Bulawayo. European pop. only (1953 est.) 40,000. Governor in 1955, Vice-Adm. Sir Peveril William-Powlett; prime minister, Reginald Stephen Garfield Todd.

History.—In March 1955 the federal prime minister, Lord Malvern, announced the decision, following reports from French consultants, to proceed with the Kariba scheme on the Zambezi river. The alternative scheme, at Kafue in Northern Rhodesia, was still being actively investigated. In Nyasaland the Shire valley scheme was announced for control of the level of Lake Nyasa and the Shire river and hydroelectric power estimated to cost finally £75,000,000. The International Bank for Reconstruction and Development indicated its willingness in principle to lend money for the Kariba scheme; it was estimated that the first stage (to provide a generating capacity of 460 megawatts) would cost £55,000,000 by 1960 and the completed scheme (1,000 megawatts) £85,000,000. A lake nearly 200 mi. long and up to 30 mi. wide would be created by the 350-ft. dam.

The second budget presented by the minister of finance, Donald Macintyre, in June showed that the national income had increased to £265,000,000 in 1954, 12% above 1953 and 80% higher than in 1950. Exports in 1954 were valued at £153,000,000, an increase of £5,000,000 over 1953; total imports amounted to £125,000,000, giving a favourable visible balance of trade of £28,000,000 a year. In the first six months of 1955 exports totalled more than £76,000,000 and imports nearly £66,500,000. A record crop of 120,500,000 lb. of flue-cured tobacco was sold for more than £20,000,000. The first federal customs tariff came into force in July together with a new trade agreement with the Union of South Africa. The underlying policy was to assist those secondary industries which process and manufacture the raw materials of the federation.

On Aug. 1 the rail link was completed between Bannockburn in Southern Rhodesia and the port of Lourenço Marques in Mozambique. Rhodesia railways received their first shipments

of diesel electric main-line locomotives.

New federal ministries for power and law were created. A seventh cabinet minister was appointed (F. S. Owen). The federal supreme court was established on July 1 at a ceremony in Salisbury.

Immigration was encouraged by a renewed campaign and the appointment of an immigration attaché in London. The federation also became a member of the Intergovernmental Committee for European Migration at Geneva. (M. NN.)

Education.—*Northern Rhodesia* (schools, 1953): European primary 38, pupils 9,336 (of which 7 with secondary departments, pupils 1,430); coloured and Asian primary and secondary 8, pupils 492; African primary pupils 167,129 (of which 15,742 middle school) and secondary 430; African teachers in training 807; African vocational 41, pupils about 2,090. *Southern Rhodesia* (schools, 1952): European primary 147, pupils 22,328, teachers 561 (including 52 aided and recognized private, all levels); secondary 18, pupils 6,497, teachers 360; aided farm 17, pupils 119; coloured and Asian 21, pupils 3,769; African primary 2,154, pupils 231,551, teachers 6,598; postprimary 18, pupils 1,575, teachers 99; teachers' training colleges 22, students 961; institutes of higher (technical) education 2. *Nyasaland* (schools, 1954): government European primary 3; government coloured primary 1; African primary 4,688 (including 3 government), pupils 237,000; African secondary 4 (including 1 government and 1 multilateral with vocational departments), pupils 311; Asian primary pupils 790; African teachers in training 554 at 11 centres (including 1 government); African vocational pupils 730.

Finance and Banking.—Monetary unit: Rhodesian pound (£R1 = £1 sterling = U.S. \$2.80). Currency circulation (March 1952) £10,200,000, (March 1953) £11,400,000. Bank deposits (Dec. 1952) £42,800,000, (Dec. 1953) £45,900,000. Budgets: *federal state* (1955–56 est.), revenue £39,065,000, expenditure £61,078,115; *Northern Rhodesia* (1953 est.), revenue £30,340,709 (excluding development fund £6,977,211), expenditure £28,959,321 (excluding development expenditure £9,499,921); *Southern Rhodesia* (1954–55 est.), revenue £12,780,000, expenditure £18,676,911; *Nyasaland* (1954–55 est.), revenue £5,009,570, expenditure £4,990,025.

Foreign Trade.—(Federation 1954): imports £R1,503,480,000; exports £R1,762,080,000. Principal exports: metals and metal manufactures, minerals, tobacco, foodstuffs.

Transport and Communications.—Railways (1954): *Rhodesia* (Northern and Southern) 4,018 km.; *Nyasaland* 505 km. Roads (1954): *Southern Rhodesia* 45,600 km., of which 9,600 km. principal; *Northern Rhodesia* 25,500 km., of which 6,880 km. principal; *Nyasaland* 7,763 km., of which 2,720 km. principal. Motor vehicles licensed (1953): *Southern Rhodesia* cars 45,000, commercial vehicles 21,000; *Northern Rhodesia* cars 14,900, commercial vehicles 12,600; *Nyasaland* (Dec. 1954) cars 3,188, commercial vehicles 2,537. Telephones (Jan. 1954): *Southern Rhodesia* 37,063; *Northern Rhodesia* 6,077; *Nyasaland* 2,407.

Agriculture.—Main crops (metric tons): tobacco (1954–55 exports, dry weight) 62,000; millet and sorghum (*Southern Rhodesia*, 1953) 205,000; peanuts (*Southern Rhodesia*, 1953) 2,000; tea (exports, 1954) 7,600; cottonseed (*Nyasaland*, 1954) 5,000; cotton, lint (*Nyasaland*, 1954) 3,000; tung oil (*Nyasaland*, 1954) 928; maize (*Northern Rhodesia*, 1953) 116,711 short tons, (*Nyasaland*, 1954, surplus bought) 54,345 short tons. Livestock: *Southern Rhodesia* (Sept. 1955) cattle 3,077,000, sheep (Sept. 1954) 274,000, pigs (Sept. 1954) 128,000; *Northern Rhodesia* (Sept. 1954) cattle 972,000, sheep 61,000, pigs (1952) 46,000; *Nyasaland* (Sept. 1955) cattle 292,000, sheep 53,000, pigs (1952) 57,000.

Mineral Production.—*Northern Rhodesia* (metric tons, 1954) copper (smelter) 385,200, copper ore (metal content, 1953) 368,400, zinc (smelter) 27,000, lead (refined) 15,240, gold (1953) 103 kg.; *Southern Rhodesia* (metric tons, 1953) coal 2,618,000, iron ore (metal content) 34,700, chrome ore (metal content) 201,600, tungsten 211, asbestos 79,600, gold 15,585 kg.

Rice. The U.S. 1955 rice crop of 52,446,000 bags (of 100 lb. each) was the smallest since 1952, 11% less than in 1954, but substantially larger than the 39,357,000 bags average for 1944–53. In compliance with an acreage allotment and marketing quota program, approved by about 94% of the growers, acreage was reduced sharply by about one-fourth, to 1,815,000 ac., as compared with 2,405,000 ac. in 1954. The indicated average yield of 2,890 lb. per acre was the highest of record, 443 lb. more than in 1954 and 669 lb. above average for the decade 1944–53. The California yield was 3,400 lb. per acre, as compared with 2,400 lb. in 1954. The leading states were Texas with 14,520,000 bags (16,120,000 bags in 1954); Louisiana with 13,050,000 bags (14,996,000); Arkansas with 12,112,000 bags (14,651,000); and California with 11,254,000 bags (10,872,000). The national average support price for 1955-crop rice was set at \$4.66 per hundredweight, or 85% of parity, as compared with \$4.92 per hundredweight for 1954-crop rice. At the height of the autumn harvest, producers were receiving an average of

about \$4.50 per hundredweight as compared with \$4.04 a year earlier. Indicated U.S. consumption of 5.3 lb. per capita was the same as 1954 and comparable with 5.7 lb. pre-World War II average. Exports of rice in the 1954-55 marketing year (August to July) were 984,800,000 lb. (milled rice basis) or 37% less than the 1,574,800,000 lb. of the preceding year.

World production for 1955-56, excluding Communist China, North Korea and the U.S.S.R. was forecast at 270,210,900,000 lb., 3% more than the previous year. Of the total, 238,757,200,000 lb. were indicated for Asia. In all, 199,193,000 ac. were used as compared with 195,624,000 ac. the previous year and 178,572,000 ac. before World War II. Japan's 1955 rice crop was preliminarily forecast at a record 30,000,000,000 lb. (rough), about 5,000,000,000 lb. larger than the 1954 harvest, but a typhoon during harvest damaged quality and quantity. Europe produced, with a large acreage and favourable yields, 3,880,400,000 lb. from 996,000 ac. The Philippine estimate of the 1954-55 crop was pushed up to 7,161,000,000 lb.; even so, 100,000 metric tons were imported. On the basis of large exports during the first half of 1955, Thailand's indicated exports for the year were as high as 1,300,000 metric tons (as compared with 1,004,324

Rice Production of the Principal Producing Countries			
(In millions of pounds; rough)			
Country	Preliminary 1955-56	1954-55	Average 1945-46 to 1949-50
China	85,000	85,000	76,000
India	28,500	28,266	26,889
Pakistan	30,000	24,988	24,735
Japan	17,000	12,900	11,978
Thailand	24,100	19,300
Indonesia	14,800	14,500	10,500
Burma

tons in 1954), leaving only small carry-over stocks at the end of year. Malaya resumed large rice importation, taking 506,000,000 lb. in the first half of 1955 as compared with 247,000,000 lb. for the same period of 1954. (J. K. R.)

Rio De Oro: see SPANISH COLONIAL EMPIRE.

Rivers and Harbours. During 1955 initiation of construction work on the St. Lawrence Seaway project was a high light of continuing improvements on the rivers and harbours of the United States. This was a joint United States-Canadian undertaking to provide a 27-ft. channel from Montreal to Lake Erie, so that ocean-going vessels might continue into the Great Lakes, thus opening up a vast new area to direct ocean commerce.

An example of the studies constantly being made by the army corps of engineers to improve navigation channels was that of deepening the channels connecting the Great Lakes. Presently authorized Great Lakes connecting channels provided for controlling depths of 25 ft. for downbound traffic and 21 ft. for upbound traffic. The recommended 27 ft. would meet the needs of the larger modern vessels and would tie in with the 27-ft.-depth channels of the St. Lawrence Seaway project. At the 1955 session of congress the house approved the recommended deepening of the connecting channels. Favourable action by the senate was required, however, before the project would be authorized.

An example of a third category of river and harbour work performed by the corps of engineers, that of planning, prior to construction, was that of the Delaware river project, between Philadelphia, Pa., and Trenton, N.J., as authorized by congress in Sept. 1954. This project, in general, provided for a continuation in the Delaware river almost up to Trenton of a 40-ft. channel such as now exists up to Philadelphia. The existing channel ranges up to 28 ft. Congress appropriated \$100,000 for planning on this project in fiscal year 1956.

WATERFRONT IMPROVEMENT at Hoboken, N.J. A new pier (foreground) was completed in 1955, the first step in a program of modernization of the port facilities undertaken by authorities of both New Jersey and New York

For all phases of river and harbour work, as well as for flood control, congress appropriated \$559,506,514 for the functions assigned to the corps of engineers. This included \$553,955,500 in the regular civil functions appropriation bill and \$5,551,014 in a supplemental appropriation bill.

Major categories of the regular appropriation bill were as shown in Table I.

Table I.—River and Harbour Appropriations, 1955			
Category	Amount	Category	Amount
Construction, general* . .	\$401,173,000	General expenses . . .	\$ 9,300,000
Operation and maintenance, general . . .	83,030,000	General investigations .	5,940,000
Flood control, Mississippi river and tributaries .	51,962,500	Niagara remedial works	2,400,000
		St. Lawrence joint board .	150,000
		Total	\$553,955,500

*Includes \$5,515,000 for advance engineering and design.

In Table II are shown the 15 largest individual construction amounts.

Table II.—Construction Accounts	
Project	Amount
The Dalles dam, Ore. and Wash.	\$63,500,000
Mississippi river and tributaries, Ill., Mo., Ky., Tenn., La., Ark. and Miss.	37,262,000
Oahe reservoir, S.D.	25,000,000
Garrison reservoir, N.D.	20,100,000
Chief Joseph dam, Wash.	18,000,000
Los Angeles county drainage area, Calif.	14,000,000
Gavins Point reservoir, Neb. and S.D.	13,950,000
Buford dam, Ga.	11,830,000
McNary lock and dam, Ore. and Wash.	11,000,000
Table Rock reservoir, Ark. and Mo.	11,000,000
Tuttle Creek reservoir, Kan.	7,500,000
New Cumberland lock and dam, O. and W.Va.	7,000,000
Cheatham lock and dam, Tenn.	6,360,000
Markham Ferry reservoir, Okla.	6,300,000
Central and Southern Florida project	6,300,000

(S. D. S.)

Canada.—The second longest suspension bridge in the British Commonwealth, over the harbour of Halifax, N.S., was opened on April 2, 1955, to join the city of Halifax with the town of Dartmouth. Costing \$10,750,000, the Angus L. Macdonald bridge has a total length of 5,290 ft., including approaches. Minimum clearance over the harbour is 165 ft. The bridge accommodates a roadway 27 ft. wide and a 5-ft. sidewalk for pedestrian use.

A contract was awarded for blowing up British Columbia's notorious Ripple rock in the Strait of Georgia in what promised to be the biggest controlled explosion in Canadian history. Ripple rock lies in the track of a busy coastal shipping lane, Seymour narrows, a natural bottleneck in the channel separating Vancouver Island from the British Columbia mainland. It has been called the worst menace to navigation on the west coast of North America, having wrecked scores of vessels and taken more than 100 lives in recent decades. Two jagged peaks which rise to within 10 and 20 ft. of the surface were to be blasted

by 550 tons of nitron placed by means of an underwater tunnel, 50 ft. below the bed of the narrows, extending from the Maud Island shore. Previous attempts to eliminate Ripple rock had ended in costly failures, millions having been spent on the project.

The 1954 report of the national harbours board, which operates the eight major harbours of Canada, showed a total operating income of \$20,258,000 and a net income surplus of \$1,792,000. Equivalent figures for the previous year were \$21,000,000 and \$2,400,000. The decrease in operating income was about 4% and paralleled a reduction of the same percentage in aggregate cargo tonnage, the chief factor being a lower volume of grain traffic. Total cargo tonnage handled by the eight harbours administered by the board decreased by 4% in 1954 over 1953, the figures being 40,890,000 tons against 42,500,000 tons. Parliament voted the national harbours board \$5,107,346 for 1955 (\$4,782,500 in 1954), including \$938,900 for Halifax; \$1,250,000, Saint John, N.B.; \$1,311,500, Quebec; \$1,423,000, Churchill. (See also CANALS AND INLAND WATERWAYS.) (W. H. V. A.)

Roads and Highways. **United States.**—During 1955 the highway construction program in the United States went forward at a record-breaking rate. Estimates indicated that about 33,000 mi. of principal highways would be completed at a cost of \$3,093,000,000, and construction of an additional 75,000 mi. of local and other roads and streets would cost \$1,532,000,000. With the addition of maintenance, administration and interest to these capital outlays, highway expenditures were expected to reach \$7,200,000,000. More than 80% of the construction on principal highways represented resurfacing and reconstruction of worn-out and obsolete highways. The mileage of surfaced streets and highways was expected to reach 2,288,000, an increase of 60,000 mi. All streets and highways, improved and unimproved, totalled 3,396,000 mi. Motor vehicle registrations exceeded 61,000,000 during 1955.

The federal-aid highway program accelerated considerably during the year as the result of an increase in the annual authorization rate from \$575,000,000 to \$875,000,000 and an early apportionment of the 1956 funds, effective July 1, 1954. Federal and federal-aid projects completed during the fiscal year ending June 30, 1955, including work in national forests, national parks and other federal areas and miscellaneous projects, totalled 22,155 mi.

At the end of the year more than 3,500 mi. of expressways were completed or under construction in the United States. At mid-year 1,471 mi. of toll highways were in service and 1,527 mi. were being built; it was estimated that expenditures for these roads would amount to \$2,500,000,000.

Africa.—The Belgian Congo, in its third year of a ten-year program to build 5,700 mi. of first-class arterial roads, was lagging because of lack of funds but had completed 310 mi. and surveyed 2,500 mi. Over-all mileage of all roads amounted to 75,000. South Africa had completed 4,200 mi. of a proposed 5,270-mi. national road system conceived in 1934, the annual cost averaging \$14,000,000. In addition, the provincial road mileage had grown to 104,000 with about 350 mi. of all type construction being added annually. Ethiopia completed restoration of its primary system of highways to better than prewar condition, including 550 mi. in Eritrea, and was planning a system of secondary development roads. Egypt intensified its road-building program and established a highway training centre with \$3,000,000 technical aid funds. The Cairo-Alexandria road was being reconstructed to higher standards, a project expected to cost \$20,000,000 and to be completed in 1956. Egypt's share in the \$30,000,000 road construction project to connect the Arab countries was \$5,000,000; construction was already begun.

The 316-mi. Suez-Matruh road was still under construction. Liberia had spent more than half its \$6,000,000 first five-year highway program funds on improvement of a 175-mi. road between Monrovia, the capital, and the French Guinea boundary, and about one-fourth on a development road at the other end of the country. A second construction program with \$15,000,000 available was begun, to reach the interior provinces and connect them with the two port towns.

Canada.—Canada was second only to the United States among the nations of the world from the standpoint of dollars per capita spent on highways. Slightly more than half the 4,187-mi. trans-Canada route remained to be completed. A total exceeding \$600,000,000 was spent on highways in 1955 by the federal, provincial and municipal governments and the army and private enterprises.

Mexico.—Three main roads from the United States to Mexico City were in use. More than \$10,000,000 had been spent in the construction of a toll road between Mexico City and Acapulco and \$4,000,000 on the Mexico City-Piedras Negras road. More than \$70,000,000 was spent on highways in 1955, compared with \$43,000,000 in 1954. Construction continued on the highway across the Isthmus of Tehuantepec. The 62-mi. connection from Tecata to Ensenada in Baja California was completed.

Central America.—The status of the approximately 1,574-mi. inter-American highway from the southern border of Mexico to the Panama canal, at the beginning of a three-year accelerated construction program, was as follows: Guatemala, 84 mi. paved, 208 mi. substandard all-weather, 25 mi. impassable, total 317 mi.; El Salvador, 175 mi. paved, 21 mi. all-weather, total 196 mi.; Honduras, 24 mi. all-weather and 70 mi. substandard, total 94 mi.; Nicaragua, 132 mi. paved, 106 mi. substandard all-weather, total 238 mi.; Costa Rica, 60 mi. paved, 219 mi. standard all-weather, 134 mi. impassable, total 413 mi.; Panamá, from Costa Rican border to the Panama canal, 98 mi. paved, 15 mi. standard all-weather, 189 mi. substandard all-weather, 14 mi. impassable, total 316 mi. South of the Panama canal, on the Pan-American highway, there were 40 mi. passable and approximately 200 mi. through the Darien area as yet unsurveyed.

South America.—Colombia's road-building program, begun in 1951 and calculated to produce 2,000 mi. of trunk highways connecting principal cities and towns with Caribbean and Pacific ports, was nearly completed. More than \$40,000,000 per year had been spent in this program. The 300-mi. road from Medellín to Turbo on the Gulf of Urabá was completed during 1955. Peruvian highway expenditures jumped from less than \$600,000 in 1948 to more than \$11,000,000 in 1955. Chile began a five-year development program estimated to cost \$80,000,000 annually, with \$32,000,000 to be spent on the Pan-American highway. The road system in Uruguay amounted to 4,000 mi., a 33% increase in mileage since 1947. Paraguay, with less than 1,200 mi. of road, began construction of a 310-mi. all-weather highway from Asunción, the capital, to the rich Mennonite farm lands. Venezuela completed 18 mi. of bridges, 200 mi. of pavement and 260 mi. of first-class road to raise its total mileage of first-class road to 300 and of all types to 1,000. The 600-mi. Pan-American highway section between Caracas and the Colombian frontier was completed. The first road in southern Ecuador to reach the sea, the 100-mi. Cuenca-Pasaje road, was completed in 1955 and was part of a three-year plan to spend \$35,000,000 on 560 mi. of highways, including sections on the Pan-American and Andes-to-the-Pacific east-west roads. Brazil, with only 1,250 mi. of high-type paved highways, planned a 31,000-mi. system to connect with roads in Venezuela, British Guiana and Peru. Bolivia completed the 310-mi. Cochabamba-Santa Cruz highway in 1954, after ten years' effort, and had paved almost the entire length. Argentina spent \$25,000,000 on highways in 1955 and

HUMOROUS WARNING SIGN, one of 180 placed along a 182-mi. stretch of U.S. highway 1 in North Carolina by the state highway commission. Increasing use of the signs was planned if studies of 1954 and 1955 accident statistics indicated that motorists were heeding the slogans

planned to spend \$14,000,000 annually on expressways. The 2½-mi. limited-access approach to Buenos Aires was under construction at an estimated cost of \$1,000,000.

England.—A four-year program to improve existing roads and lessen traffic jams at important intersections was begun, with \$600,000,000 allotted for over- and underpasses. The sum of \$180,000,000 would be spent on multilane national expressways, one between London and Yorkshire and another between Birmingham and Preston. A program for the complete rebuilding of Great Britain's highway system was being studied.

Europe.—The Lulea-Malmö expressway in Sweden was nearing completion as a four-lane divided superhighway. New construction and maintenance lagged in France, west Germany, Yugoslavia and neighbouring states because of lack of funds. Belgium completed 35 mi. of a 175-mi.-long superhighway and had a long-range program for construction of 610 mi. of limited-access express roads, 3,750 mi. of first-class highways and 8,125 mi. of secondary roads. Italy completed 500 mi. of roads at a cost of \$46,000,000 in 1955, to swell the total completed in recent years to 4,450 mi., and had 2,200 mi. under construction. A five-year highway improvement program in Spain was completed, and the country's network included 12,000 mi. of national roads, 13,600 mi. of regional roads, 21,000 mi. of local roads and, with the provincial roads, totalled 77,500 mi. Switzerland had 10,350 mi. of main roads, 4,480 mi. of secondary and 19,200 mi. of local for a total of 34,030 mi. of improved highway. Greece in the five years ending in 1955 completed construction of 19,000 mi. of new roads and reconditioning of 2,500 mi. of war-damaged roads.

Near East.—In Jordan surveys were completed for a \$5,000,000 construction program and work was begun on a bridge across the Jordan river. More than \$2,500,000 in highway construction equipment was imported and put to work. Turkey completed eight years of highway modernization, for which the United States contributed more than \$43,000,000 in aid. The system included 15,150 mi. of national roads. Twenty-four miles of paving were completed in Saudi Arabia on the 171 mi. from Jidda to Medina, making a total of 87 mi. of paved road in the country. Construction was begun on the 1,000-mi. trans-Arabian highway between Jidda and Dammam and on the Mecca connection to that route. Iraq in the second year of its second five-year highway improvement program had 32 projects, covering 1,000 mi., and 30 bridges, including a 500-ft. structure over

the Euphrates, under construction estimated to cost \$27,000,000. Iran established a highway research laboratory at Tehran and proposed spending \$85,000,000 in extension of its 3,750-mi. system of main highways.

Far East.—India had under construction about 700 mi. of new road paralleling its northern border and completed a number of short feeder roads into the Himalayas. In Tibet two completed highways provided new links between that country and China. The journey from Lhasa to Yaan was reduced from several months by caravan to ten days by motor.

Japan was in the second year of a highway improvement program estimated to cost more than \$700,000,000, to be spent on a 26,200-mi. highway system, including two underwater inter-island vehicular tunnels. The Resettlement and Development program on the island of Mindanao in the Philippines progressed as expected. Nineteen new bridges had been built, ten in 1955. Eighty-six miles of new roads were built, 50 during 1955, to assist new settlers in reaching resettlement areas. On the other islands, more than 250 mi. of roads were rebuilt or improved, including erection of permanent bridges, and 3,720 mi. placed under permanent machine maintenance. Formosa was planning to restore its 1,000 mi. of trunk roads, 2,800 mi. of county and rural roads and 5,900 mi. of lower-class roads. (See also MOTOR TRANSPORTATION.)

Roman Catholic Church. In 1955 the College of Cardinals comprised 60 members. Three in nations under communist influence were restricted in their full liberty of action.

Communist contempt for religion had brought death, imprisonment, expulsion and suffering to at least 185 bishops and other heads of sees throughout the world. Communist China was responsible for 99 names on the list, among which were Cardinal Tien, archbishop of Peking, 18 archbishops, 56 bishops and 24 monsignori. The U.S.S.R. ranked second on the list of persecutors with 29 victims. Other countries marked as persecutors were Albania, Bulgaria, Czechoslovakia, Hungary, North Korea, Poland, Rumania and Yugoslavia.

The total Catholic population of the world at the beginning of 1955 was estimated at 470,100,000. The Americas had 191,424,000 Catholics, the United States (including Alaska and the Hawaiian Islands) accounting for 32,575,702. This last figure represented a ten-year increase of 8,612,031 more than the 23,963,671 Catholics reported in 1945.

Serving the Catholic people through the world were 360,000 priests, the ratio being nearly one priest for every 1,300 Catholics. Of this total number of priests 27,760 were missionaries working among a non-Catholic population of 2,000,000,000 of whom 1,500,000,000 were non-Christian.

There were 26 archdioceses and 106 dioceses in the United States. The hierarchy consisted of 208 members: four cardinals, 34 archbishops and 170 bishops, the largest number in the history of the Catholic Church in the country.

At the parish level 13,362 communities were reported, 673 being without resident clergy. Also listed were 8,085 chapels, 4,905 missions and 1,878 stations, an increase of 636 in the number of places where Holy Mass was celebrated regularly.

The United States Catholic Negro population increased by 20,000, of whom 10,000 were converts. The 1955 Catholic Negro population was about 477,000, served by 655 priests in 45 parishes. They were assisted by 1,800 nuns and 600 lay workers

There were 345,000 persons of American Indian blood in the United States, of whom 111,327 were Catholics. Among the Indians, 175 priests maintained 410 churches and chapels.

The 3rd International Catholic Congress on Rural Life, an organization established to raise the standards of the spiritually and materially underprivileged rural population of the world, took place between April 17 and April 25, 1955, at Panamá city. The theme of the congress was set in a long message from Pope Pius XII. He called on large land owners to fulfil their "grave duty" of paying a just wage and to contribute toward the social and economic improvement of their workers. He further recommended that "the state must favour in its legislation the rural segments, sometimes in the matter of taxes and at other times regarding the sale of products. It should also help with agricultural credits and social security."

The 36th International Eucharistic congress opened in Rio de Janeiro, Braz., on July 17. Its purpose was to emphasize the unity of belief among Roman Catholics throughout the world and their fidelity to the Sacrament. The congress assembled nearly a million persons in Rio de Janeiro and brought more than 10,000 pilgrims from many countries. Besides 20 cardinals, 300 archbishops and bishops attended. An address in Portuguese by Pope Pius XII, broadcast from Rome, was the final act of the congress.

Pres. Juan D. Perón of Argentina accused a number of Catholic priests and the Catholic Action organization (Acción Católica Argentina) of infiltrating into the trade unions, the universities and other organisms of the national life of Argentina and alleged that the members of the Roman Catholic hierarchy were engaging in "intrigues" against the state. Three measures directed in effect against the church were authorized by Perón: a decree abolishing church control of religious education in schools; a bill legalizing divorce; a decree legalizing prostitution which had been banned in Argentina for 18 years. During the first half of 1955 more than 100 priests and Catholic students were jailed following public protests against the action taken by the government. The Argentine Episcopate issued a pastoral letter calling for the complete freedom of the press, radio and public assembly as "indispensable conditions" in order that "a real public opinion representing the thought of all inhabitants of the country can fully and freely express

itself." The pastoral letter stressed that it was essential that the rights and liberties of the church and its institutions should be safeguarded. Two prelates were arrested on charges of instigating violence. Following the expulsion of Bishop Tato and of the Vicar General Msgr. Novoa of the archdiocese of Buenos Aires, the Sacred Consistorial congregation in Rome declared that all officials participating directly or indirectly in the measures taken by the Argentine government had incurred excommunication.

After a revolt had forced the resignation of Perón in Sept. 1955, Archbishop Santiago Cardinal Copello, in his first official broadcast since the outbreak of church-state hostilities, urged the people to go back to work and restore peace.

On Oct. 20, 1955, the new Argentine government restored to the Catholic Church all privileges it lost during the Perón dictatorship.

On March 2, 1955, the Rev. Georges Bissonnette, an American Assumptionist priest who was serving the religious needs of the Catholic American community in Moscow, was ordered to leave the Soviet Union. Charles E. Bohlen, the United States ambassador to the U.S.S.R., lodged a protest on the ground that Father Bissonnette's expulsion violated the Litvinov agreement of 1933 guaranteeing freedom of conscience and religious worship to United States nationals on Soviet soil. The United States Catholic community in Moscow was still without a pastor at the close of the year.

The James J. Hoey awards, conferred each year on a white and Negro Catholic layman who have made outstanding contributions to the cause of interracial justice during the year, were bestowed upon Millard F. Everett of New Orleans, La., editor of *Catholic Action of the South*, and to James W. Hose, a physician. Hose, the Negro winner, was the guiding spirit behind the new Collins Chapel hospital in Memphis, Tenn. Everett was cited for his paper's uncompromising stand on the race question and against Louisiana's so-called "right to work" laws.

George Meany, president of the American Federation of Labor, received the 1955 University of Notre Dame Laetare medal for "conspicuous leadership in the ranks of labour" and his "practical Christian life." The university makes the award annually to an outstanding Roman Catholic layman. Meany was the first labour leader to receive the Laetare medal in its 78 years' history. Rowing. The longest winning streak in intercollegiate rowing history was broken on May 7, 1955, when the University of Pennsylvania varsity defeated the U.S. Naval academy eight. After three all-winning seasons, the sweep-swingers from Annapolis, Md., lost on the Charles river at Cambridge, Mass. Navy, with six members of its great crew of 1954 missing, won its first two races of 1955, against Princeton, and Cornell and Syracuse to extend its unbeaten string through 31 regattas. With their victory over Cornell and Syracuse at Annapolis, the Middies won the Clifford Goes trophy, up for competition for the first time. Russell (Rusty) Callow, Navy coach, was chosen as winner of the first national citation for an outstanding contribution to American rowing. He received the Mid-Hudson Schoolboy Rowing association plaque following a nation-wide poll of sports writers and rowing experts.

Following its victory over Navy, Penn went on to eight straight triumphs. They remained unbeaten going into the Intercollegiate Rowing association championship at Syracuse, N.Y.,

CATHOLIC CARDINALS at the opening of the 36th International Eucharistic congress, Rio de Janeiro, Braz., July 19, 1955. Twenty cardinals attended. Francis Spellman, archbishop of New York, and Samuel Stritch, archbishop of Chicago, are shown third and fifth from the left, respectively

oil) to the scraped bark just beneath the tapping cut brings about a quick response. Latex yield increases to a maximum in two weeks followed by a slow decline. the effect wearing off in about three months. No more than two applications a year are recommended. The Rubber Research institute exchanged clonal planting material with the Institute Agronomico do Norte, Brazil, and received in addition eight Dothidella-resistant clones for introductory trials in Malaya. This was a precautionary measure because the devastating South American leaf blight disease had never spread to far east areas.

Synthetic Rubber.—World production of all types of synthetic rubber for 1954 (excluding production in the U.S.S.R. and satellite countries, said to amount to 250,000 long tons annually) was 716,388 long tons of which the U.S. produced 622,852 long tons. This was a sharp drop as compared with that of 1953, and the trend was reversed in 1955, when in the first six months world production of all types totalled an estimated 506,660 long tons, compared with 351,211 long tons for the same period of 1954. The International Rubber Study group in October estimated total world production (excluding U.S.S.R. output) of synthetic rubber for 1955 at 1,065,000 long tons. Principal world stocks of synthetic rubber stood at an estimated

160,000 long tons at the end of June 1955. Production of synthetic rubber latices in the U.S. for 1954 totalled on a dry rubber basis: GR-S type 47,714 long tons; neoprene 8,214 long tons; N-type (butadiene-acrylonitrile copolymer) 6,866 long tons.

In the U.S. by May 1, 1955, all of the government-owned GR-S facilities—except the Akron (O.) laboratories, the plants at Institute, W.Va., and at Baytown, Tex.—had been sold for \$259,529,000. In addition, the private buyers had paid \$26,236,000 for raw material and miscellaneous equipment at the plants and about \$24,800,000 for inventories of synthetic rubber on hand. These amounts plus \$91,000,000 cash on hand in the synthetic rubber office of the Federal Facilities corporation yielded a total return to the government at that time of about \$401,565,000. On July 15 the Baytown plant was sold for a total of \$8,644,000. The government also realized \$2,279,700 from the sale of 447 pressurized tank cars.

The price structure of synthetic rubber remained much the same as in 1954. Depending on freight costs or allowances, GR-S 23 sold for 25 cents per pound; butyl 23 to 24 cents per pound; neoprene GN 41 cents per pound; N-type 58 cents per pound—all U.S. currency.

In Germany the chemical firms of Bayer, Hoechst and Badische Anilin planned large-scale expansion of the synthetic rubber industry there. The new firm, known as Buna Co., expected to have an output in 1958 of 45,000 metric tons.

In the U.S. on Dec. 2, 1954, announcement was made by

PARACHUTE TEST DROP of a load of military equipment protected by six "aero-pallet cushions," self-inflating rubber shock absorbers developed in 1955 to reduce the landing impact of heavy machinery dropped from aircraft

Goodrich-Gulf Chemicals Inc. that a group of its scientists working at the B. F. Goodrich Research centre in Brecksville, O., had duplicated by synthetic means the natural rubber molecule. The method used was not revealed. Identification was made by infra red spectra and X-ray diffraction patterns, which were virtually identical with those of Hevea rubber. The new synthetic, called Ameripol SN, mills like natural rubber and shows the same excellent tack, high gum tensile strength and low hysteresis (heat buildup on flexing) that natural rubber shows. Ameripol SN was used successfully to build heavy duty truck tires for which previously no variety of synthetic rubber would serve.

On Aug. 22, 1955, the Firestone Tire and Rubber Co. announced that members of its research staff had, two and a half years prior to that date, synthesized a rubber which showed an infra red spectrum and an X-ray pattern of the stretched vulcanizate which were essentially the same as those of natural rubber. Firestone said the new polymer, called coral rubber, was made by polymerization of petroleum-derived isoprene with an ionic alkali metal catalyst. Coral rubber showed some tack but not to the degree shown by Hevea rubber. In other properties it resembled natural rubber, however, and heavy-duty truck tires made of the new rubber performed satisfactorily in service. Both Ameripol SN and coral rubber were reported to be in the pilot plant stage.

Reclaimed Rubber.—World production of reclaimed rubber in 1954 was 343,195 long tons. For the first six months of 1955 it was an estimated 207,000 long tons compared with 172,608 long tons for the same 1954 period. U.S. consumption through

*All figures include both natural and synthetic reclaimed rubbers.

June 1955 was 161,798 long tons compared with 126,197 long tons for the same 1954 period.

Rubber Manufacturing.—World consumption of new rubber in 1954 was at an all-time high level of 2,505,000 long tons with a further shift toward natural as compared with synthetic. The total for all countries reporting was divided 70% natural, 30% synthetic rubber. In the U.S. the division for 1954 was 48% natural, 52% synthetic rubber. In the first six months of 1955 world consumption of new rubber was divided 65% natural, 35% synthetic rubber. In the U.S. for the same period, the division was 43% natural, 57% synthetic rubber. On the basis of the first six months' figures, world consumption of all varieties of new rubber in 1955 would approximate 2,900,000 long tons. In the U.S., one source estimated the rubber industry's sales in 1955 would exceed \$5,250,000,000 and new rubber consumption would approach 1,500,000 long tons.

Total shipments of pneumatic tire casings in the U.S. in 1954 (excluding aeroplane and industrial pneumatics) were 93,390,357 units (passenger 77,712,667; truck and bus 12,527,858; farm tractor and implement 3,149,832). Shipments for the first eight months of 1955 totalled 79,018,826 units (passenger 66,371,275; truck and bus 9,939,973; farm tractor and implement 2,707,578) compared with shipments during the same 1954 period of 65,837,997 units (passenger 55,255,313; truck and bus 8,272,502; farm tractor and implement 2,310,182). Tire inventories in the hands of manufacturers at the end of Aug. 1955 totalled 14,577,879 units compared with 10,470,057 units for the same date in 1954. (E. B. NN.)

Ruiz Cortines, Adolfo (1891—), president of Mexico, was born on Dec. 30 in the state of Veracruz. He first rose to national political prominence when he became governor of Veracruz in 1944. When Miguel Alemán was elected president of Mexico in 1946, Ruiz Cortines became one of his most influential political aides and was later named minister of the interior. On Oct. 13, 1951, he was nominated by the Partido Revolucionario Institucional (P.R.I.) to succeed Alemán as president, and the following July he was elected by a huge majority. He took office on Dec. 1, 1952, for a six-year term. A determined advocate of economy and honesty in government, Ruiz Cortines refused to accept the usual president's special expense account and in 1953 exposed considerable graft among high officials of the Alemán administration, seizing their property and cancelling their government contracts.

In Feb. 1955 he conferred with U.S. Vice-Pres. Richard M. Nixon during the latter's good-will visit to Mexico. On Sept. 1, 1955, he declared in his annual message to congress and the nation that Mexico during the preceding year had attained the greatest economic prosperity in its history.

Rulers: see PRESIDENTS, SOVEREIGNS AND RULERS.

Rumania. A people's republic of southeastern Europe, Rumania is bounded north and northeast by the U.S.S.R., east by the Black sea, south by Bulgaria and west by Yugoslavia and Hungary. Area: 91,654 sq.mi. Pop.: (1948 preliminary census) 15,872,624; (1953 est.) 17,150,000. Language (1948 census): Rumanian 85.7%; Hungarian 9.4%; German 2.2%; Yiddish 0.9%; other 1.8%. Religion (1947 est.): Orthodox 81%; Greek Catholic 9%; Roman Catholic 7%; other 3%. Chief towns (pop., 1948 census): Bucharest (Bucuresti; cap.) 1,041,807 (1952 est. 1,042,000); Cluj 117,915; Timisoara 111,987; Ploesti 95,632; Braila 95,514; Iasi (Jassy) 94,075; Brasov (renamed Stalin) 82,984; Oradea 82,282; Galati 80,411.

First secretary of the Rumanian Workers' (Communist) party in 1955, Gheorghe Gheorghiu-Dej; chairman of the presidium of the grand national assembly, Petru Groza; chairmen of the council of ministers, Gheorghe Gheorghiu-Dej and (from Oct. 3) Chivu Stoica.

History.—In Rumania, as in other communist countries of eastern Europe, 1955 saw the abandonment of the relatively "soft" economic policy, especially in agriculture, which had been followed in 1953 and 1954. The continuing internal debate over policy was reflected in personal conflicts among the leaders of the regime and in the repeated postponement of the Rumanian Workers' (Communist) party congress, first announced in 1954, until the end of the year. Gheorghiu-Dej's resumption of the post of party secretary in October indicated that some of the internal problems had been resolved, at least temporarily.

The main disputes centred around the question of policy toward the peasants. In the early months of the year the government was still making certain concessions to the farmers, in the form of higher prices for goods delivered and reduced prices for equipment. Gheorghiu-Dej drew attention to the fact that the area under wheat was 300,000 ha. or 12.5% less than the average of 1948–50 and promised greater government aid to agriculture. Groza told a specially summoned conference of farmers in March: "The aim of this conference is clear, the undertaking of a great battle to gain more and better bread for all the workers, bread without which we cannot live."

In April Gheorghiu-Dej reverted to a more orthodox communist line, stressing the prime importance of heavy industrial development and calling for the "isolation" of the wealthier farmers and for more rapid collectivization. In accordance with this policy a revised system of land taxation was introduced in June. The government came to recognize that farming could not be conducted on a large-scale basis without substantial capital investment in it. The budget introduced in May therefore showed an increase of 25% in allotments to agriculture. The grain harvest in 1955 was the largest in five years and exceeded 10,000,000 tons.

At the beginning of October Gheorghiu-Dej relinquished the post of chairman of the council of ministers and reassumed control of the Communist party as first secretary. He was succeeded as premier by Chivu Stoica, a veteran communist and trade unionist and hitherto a deputy prime minister.

The government declared an amnesty in June for all Rumanian citizens and former citizens now living abroad. The decree was part of a general communist campaign to persuade émigrés to return.

Rumania was among the communist states represented at the Warsaw conference in May and subscribed to the new treaty of friendship, co-operation and mutual aid between the countries of eastern Europe and the Soviet Union.

The conclusion of the Austrian peace treaty on May 15 raised the question of the continued presence in Rumania of Soviet troops, whose nominal function was to guard Soviet lines of communication with Austria. Gheorghiu-Dej was constrained to declare officially that the Soviet troops would not be withdrawn, in view, he said, of the changed situation in Europe arising from the conclusion of the London and Paris agreements. It was noted that the Warsaw agreement had in any case provided the Soviet government with legal grounds for stationing troops in any satellite country. In August the government announced that the total manpower in the armed forces would be reduced by 40,000 by the end of the year.

In June N. A. Bulganin, Soviet premier, and N. S. Khrushchev, first secretary of the Communist party of the Soviet Union, visited Bucharest after having mended their quarrel with Marshal Tito of Yugoslavia. Though some improvement

in Rumania's relations with Yugoslavia was later noted, differences arose over the fate of the Serbian minority in Rumania. (See also EASTERN EUROPEAN ECONOMIC PLANNING.)

(D. FD.)

Education.—Schools (1951): primary about 14,000, pupils 1,795,000; secondary and vocational, pupils 323,000; institutions of higher education 11, students 57,000. Illiteracy (1951): 10.6%.

Agriculture.—No reliable data published since 1949. Main crops (metric tons, latest estimates): maize (1948) 5,279,000; wheat (1948) 2,600,000; barley (1947) 360,000; oats (1946) 280,000; rye (1947) 66,000; potatoes (1949) 1,090,000; sugar beets (1950) 844,000. Wine production (1951) 4,000,000 hl. Livestock (latest estimates): cattle (1953) 4,674,000; pigs (1950) 2,300,000; sheep (1948) 7,088,000; horses (1948) 939,000. Wool production, greasy basis (1934-39 average): 24,166 tons. The grain production in 1955 was said to be the best in five years, exceeding 10,000,000 tons, compared with the 1938 harvest of about 8,000,000 tons.

Industry.—Employment in industry (1955) about 2,800,000. Production (metric tons, 1954 est.): coal, 350,000; lignite, 6,000,000; crude oil, 9,800,000; natural gas, 3,800,000,000 cu.m.; electricity, 4,000,000,000 kw.hr.; pig iron (1952) 390,000; steel, 780,000; cement, 1,800,000; sulphuric acid (1955 plan), 143,000.

Finance.—Monetary unit: leu (pl. lei) with official exchange rate, high and fictitious, of 6 lei to the U.S. dollar. Budget (1954 est.): revenue 44,405,000,000 lei; expenditure 43,005,000,000 lei, including 19,350,000,000 lei invested in heavy industry.

Foreign Trade.—(1950) Imports U.S. \$213,000,000; exports U.S. \$239,000,000. Main sources of imports (1950): U.S.S.R. 49%; Czechoslovakia, Poland, Hungary and Bulgaria 33.3%. Main destinations of exports: U.S.S.R. 58.2%; four eastern European countries 30.4%. Rumanian trade with 17 western European countries (1953): exports U.S. \$48,600,000; imports U.S. \$56,300,000.

Transport and Communications.—Roads (1945): 43,163 mi., including 1,150 mi. modernized in 1947. Licensed motor vehicles (Dec. 1950): cars 14,000; commercial 12,000. Railways (1949): 7,363 mi. Telephones (1954 est.): 140,000. Radio receiving sets (1949): 226,000.

Running: see TRACK AND FIELD SPORTS.

Rural Electrification Administration. The Rural Electrification Administration marked its 20th year in 1955 with successful programs in financing rural electrification and telephone facilities.

In rural electrification, REA loaned \$167,530,430 in the year ending June 30, 1955. This brought the total of such loans since the agency was established in 1935 to \$3,050,000,000. The number of consumers on REA-financed power lines exceeded 4,000,000, including more than half of the nation's 4,900,000 electrified farms.

Two new generation and transmission co-operatives and one new electric distribution co-operative received loans during the fiscal year. This brought the number of active REA electrification borrowers to 999. These included 937 co-operatives, 40 public power districts, 17 other public bodies and 5 electric companies.

Two co-operatives paid off their government loans during the year with earnings from farm service. This made three co-operatives to repay with such earnings.

Use of electricity on REA-financed lines increased 14% during the 1955 fiscal year and the REA borrowers distributed about twice the amount of power they did in 1950. Energy sales amounted to about \$1,100,000 per day. Farmers on REA-financed lines used an average of 2,712 kw.hr. in 1954. In 1950 the annual average use was 1,752 kw.hr.

In the rural telephone program, REA loans in the fiscal year 1955 totalled \$52,744,000. This brought the total of such loans, since the program was established by congress in 1949, to \$234,181,000 to 176 independent telephone companies and 175 co-operatives. When the facilities contemplated in these loans were completed, REA telephone borrowers would be providing modern telephone service to more than 515,000 farm families and other rural subscribers in 43 states and Alaska. As of June 30, 1955, 157 REA-financed telephone organizations had placed in service 533 new dial exchanges.

In both the electrification and telephone programs, REA loans bear 2% interest and must be repaid over a maximum period of 35 years. As of June 30, 1955, electric borrowers had

paid the government approximately \$210,000,000 in interest and had repaid \$413,000,000 of principal on their REA loans. This included a current balance of \$85,000,000 of payments made by borrowers ahead of schedule which could be applied against future interest or principal instalments. Less than \$400,000 was delinquent. In the newer telephone program, principal and interest payments overdue amounted to about \$500,000.

For the 1956 fiscal year congress authorized \$160,000,000 in new electrification loan funds, plus reserve funds of \$100,000,000. Also available for loan was \$55,723,000 carried over from the previous years. New telephone loan funds authorized by congress amounted to \$75,000,000 for the fiscal year 1956. Funds carried over from 1955, amounting to \$33,556,000, also were available for telephone loans. (See also CO-OPERATIVES.)

Russian Literature. The principal event of the year 1954-55 for Russian literature was the second congress of the Union of Soviet Writers, which was held in Moscow during Dec. 15-26, 1954. The previous congress had met 20 years earlier under the presidency of Maxim Gorky. The second congress was attended by 738 delegates, representing 3,695 writers belonging to 45 nationalities. Thirty-one foreign writers had also been invited. The principal report, on "the position and tasks of Soviet literature," was presented by Aleksey Surkov, first secretary of the union. Reports were also presented by Samed Vurgun (Soviet prose); Konstantin Simonov (literary prose); Aleksandr Korneichuk (drama); Boris Polevoy (literature for children and young persons); Serghey Gherasimov (motion pictures); Pavel Antokolsky, assisted by Mukhtar Aouezov and Maxim Rylsky (translations from the literature of the peoples of the U.S.S.R.); and Boris Rurikov (the main problems confronting literary criticism).

The congress, which took place under official auspices, was opened by a message from the central committee of the Communist party, reminding writers of their duty to inspire a mood of "socialist realism" and to struggle against any reversion to nationalism, cosmopolitanism and other manifestations of "bourgeois ideology." It closed with a reply from the congress to the party, promising to oppose all deviations from socialist realism and to serve the cause of world peace. Many writers were severely criticized, notably Ilya Ehrenburg for his novel *The Thaw* and Vera Panova for her novel *The Seasons*. The congress re-elected its governing bodies, the presidium and the secretariat. Aleksey Surkov remained first secretary, i.e., the real head of the union.

Two other literary conferences were held during 1955. The first, from May 28 to 31, was on military literature; writers were invited to concern themselves primarily with Russia's heroic past, with the exploits of the soldiers during the national struggle against Hitlerite Germany and with the day-to-day life of the army. They were also asked to write biographies of military leaders and to translate books about military subjects published abroad. On their side, the political leaders of the army proposed that books about the war should conform more closely to historical truth than in the Stalin era.

The second conference, which met in mid-July, was for writers on "kolkhozian themes"; the conference complained that contemporary literature was not sufficiently concerned with the life of the peasants in the collective farms and in particular in the newly developed areas in Siberia.

According to Soviet practice, two periods of ten days were set aside during the year, one devoted to the literature of Byelorussia (Feb. 11-21), the other to that of Bashkir (May 27-June 5). From March 21 to 23 the Maxim Gorky Institute of World Literature assembled many writers to consider the achievements and failures of Soviet literature during 1954-55.

The Order of Lenin was awarded to Mikhail Sholokov on the occasion of his 50th birthday (May 23). To mark the occasion, newspapers, literary reviews and the radio paid tribute to this great Cossack novelist, author of *And Quiet Flows the Don*. Also, many hitherto unpublished chapters of his second great novel, *Virgin Soil Uplifted*, were published. By 1955 Sholokov's works had run into more than 400 editions, numbering throughout the world nearly 21,000,000 copies. *And Quiet Flows the Don* had been published in 18 languages, and 7,755,000 copies had been printed. *Virgin Soil Uplifted* had appeared in 45 languages, within the U.S.S.R. and abroad. The Soviet literary world also celebrated, in April, the 55th anniversary of the death of Vladimir Mayakovsky, considered to be the father of Soviet poetry. The Order of Lenin was also awarded, in his 50th year, to the Ukrainian writer Aleksandr Korneichuk.

As in other years, the Union of Soviet Writers was associated with many foreign literary commemorations: the 150th anniversary of the birth of Hans Andersen (in April); the bicentenary of the death of Montesquieu (in February); the 150th anniversary of the death of Schiller (in May); the 50th anniversary of the death of Jules Verne (in March). The publication of the periodical *Inostrannaya Literatura* ("Foreign Literature") was resumed; in its third number it began to publish a translation of Ernest Hemingway's *The Old Man and the Sea*.

(A. PR.)

Rye. The 1955 U.S. rye crop of 28,448,000 bu. was a large one by comparison with 23,688,000 bu. in 1954 or an average of 21,097,000 bu. for the previous decade. From 5,052,000 ac. sown in the fall of 1954, much of which was used for pasture or as a cover crop, acreage harvested was 2,081,000, 21% more than the 1,718,000 ac. of 1954 or an average of 1,740,000 ac. The average yield was 13.7 bu. per acre as compared with 13.8 bu. in 1954 and 12.1 bu. per acre for the decade 1944-53. North Dakota with 7,950,000 bu. was the leading producer, followed by South Dakota (3,718,000 bu.) and Illinois (2,738,000 bu.)

Domestic disappearance in 1954-55 was 23,000,000 bu. consisting of 5,100,000 bu. for food, 4,700,000 bu. for distilling, 6,700,000 bu. for feed and 6,500,000 for seed. Exports were 3,000,000 bu. Carry-over stocks on July 1 were 16,100,000 bu., the largest since 1944. Imports during 1954-55, largely from Canada, were under a quota of 3,300,000 bu., as compared with 13,500,000 bu. imported in 1953-54. The quota was continued at the same level for the next two years. Price support to producers was reduced to \$1.18 per bushel on the 1955 crop as compared with \$1.43 per bushel on the 1954 and 1953 crops. The Commodity Credit corporation owned 6,454,000 bu. of rye on June 30, 1955; about 30% or 7,250,000 bu. of the 1954 crop

RADIOACTIVE RYE PLANTS being injected with a fungus to produce spur-like projections on the plants, from which radioactive forms of the drugs ergonovine and ergotamine would be prepared. This was part of a continuing research program at the Argonne National laboratory of the U.S. Atomic Energy commission in 1955

was put under the support program and it appeared likely that an even larger amount from the 1955 crop would come under the program.

World rye production was estimated at 1,610,000,000 bu. as compared with 1,575,000,000 bu. in 1954 and 1,732,000,000 bu. average pre-World War II. Rye stocks on July 1 of the principal exporting countries were 43,000,000 bu., compared with 1954 (49,000,000 bu.) and 1953 (66,000,000 bu.) (J. K. R.)

Saar. A German state (*Land*) united with France by monetary (from Nov. 20, 1947) and customs (from April 1, 1948) union. Area: 991 sq.mi. Pop.: (1954 est.) 980,858. Language: German. Religion: Roman Catholic 73.4%, Protestant 25.3%. Capital: Saarbrücken, pop. (1953 est.) 116,395. Prime ministers in 1955, Johannes Hoffmann and (from Oct. 24) Heinrich Welsch.

History.—During the early months of 1955 a fresh agreement was negotiated to confirm the economic union between the Saar and France, at the same time arranging for the extension of the autonomy of the Saar. This agreement was signed on May 3 but never ratified. Just beforehand at the end of April the question of the ownership of Völklingen, the biggest steelworks in the Saar was settled. These had been confiscated from the German owner, Hermann Röchling, at the end of World War II by the French, and it was now arranged that the French and German Federal Republic governments should buy out the Röchlings for 200,000,000 DM. and divide the shares between them. This put an end to rumours that a French firm would acquire Völklingen, but German nationalist sentiment in the Saar reinstated the fact that the Röchlings were not reinstated.

Both the French and German Federal Republic parliaments having accepted the Paris treaties, which included the Saar statute signed by Pierre Mendès-France and Konrad Adenauer on Oct. 23, 1954, the council of Western European Union met in

Rye Production of the Principal Producing Countries

(In thousands of bushels)

Country	1955	Preliminary 1954	Average, 1945-49	Average 1935-39
U.S.S.R.	895,000	885,000
Western Germany	149,600	161,330*	98,900	119,000
Canada	14,700	14,176	12,653	9,191
Turkey	17,320	13,679	14,301
Spain	19,000	17,117	18,363
Netherlands	18,300	20,290	15,520	20,394
France	17,930	20,235	20,618	29,993
Austria	15,430	14,720	12,260	20,611
Other Europe* (estimated total)	445,000	405,000	337,000	481,000
United States	28,448	23,686	22,336	44,917

*Comprises Albania, Bulgaria, Czechoslovakia, eastern Germany, Hungary, Poland and Rumania.

London on June 24, 1955, to appoint a commission to supervise the referendum through which the statute attempted to provide for its own acceptance by the people of the Saar. The commission consisted of a British, Dutch, Luxembourgish and Italian member, with the Belgian senator, Fernand Dehousse, as its chairman. The date of the referendum was fixed for Oct. 23, 1955.

On July 31 the German Party of the Saar (D.P.S.) and the German Social Democratic party (D.S.P.) were re-founded and immediately transformed the situation by announcing that they would campaign for the rejection of the statute. To vote for the statute, they arbitrarily declared, would be to vote against Germany, although the statute had been sponsored by Adenauer and was supported by the German C.D.U. (Christlich-Demokratische Union). Things became still more critical when on Aug. 7 a branch of the C.D.U. was founded in the Saar under the leadership of Hubert Ney and also came out against the statute. Since the Saar population was preponderantly Catholic the outcome depended upon whether this new Catholic party could steal a following from the Catholic People's party which supported the government of Hoffmann.

The three pro-German parties joined together to form what they called the Deutscher Heimatbund which organized fiercely nationalistic meetings all over the territory of the Saar.

On Oct. 23 in the referendum, 423,434 people voted "No" and only 201,973 voted "Yes." This gave 67.7% against the statute and only 32.3% for it, 96.7% of the electorate having voted. Hoffmann immediately resigned and a caretaker government took over from him. This was presided over by Heinrich Welsch. The caretaker government arranged for the *Landtag* (Diet) to be dissolved and to be newly elected on Dec. 18. (See also EUROPEAN UNITY.) (E. Wl.)

St. Helena. British colony in the south Atlantic with dependencies of Ascension (34 sq.mi.; pop. [1953 est.] 168) and the Tristan da Cunha group (total area 38 sq.mi.; only Edinburgh settlement on Tristan da Cunha [16 sq.mi.] inhabited; pop. [Dec. 1953 est.] 292). Colony area 47 sq.mi.; pop. (mid-1954 est.) 4,880. Language: English. Religion: Christian (90% Anglican). Capital: Jamestown (pop. about 1,600). Governor in 1955, J. D. Harford; administrator, Tristan, P. R. Forsyth Thompson.

History.—The low price of flax and the consequent depression of the industry continued to cause unemployment in 1955, and in an effort to improve production plans were considered for one flax factory manager to study methods in New Zealand. Health and educational facilities continued to develop and St. Helena received substantial assistance from United Kingdom colonial development and welfare funds. The crawfish industry in Tristan da Cunha had a good season despite difficult weather conditions. In October the frigate "Magpie" landed members of an expedition en route to Gough Island to study animal and plant life and to establish a meteorological station. (J. J. Ty.)

Education.—Schools (1953): primary 6, pupils 697, teachers 12; all-range 3, pupils 261, teachers 5; secondary (including 2 middle schools) 3, pupils 316, teachers 16. Pupil-teachers: primary 18, all-range 10, secondary 4.

Finance and Trade.—Currency: sterling. Budget (1953 est.): revenue £136,172; expenditure £139,103. Foreign trade (1954): imports £215,000; exports £47,000. Livestock (1953): cattle 792; sheep 2,065; goats 2,096; pigs 141; poultry 7,802; donkeys 1,173; horses 35. Production (1953): hemp 975 long tons.

St. Kitts-Nevis: see LEEWARD ISLANDS.

St. Laurent, Louis Stephen (1882—), Canadian statesman, was born on Feb. 1 at Compton, Que., and educated at St. Charles college, Sherbrooke, and Laval university, Quebec, Que. He entered federal politics on Dec. 10, 1941, and was in turn minister of justice and attorney general, later secretary of state for external affairs. On Nov. 15, 1948, he became the 17th prime minister of Canada. As Liberal member for Quebec East, he was elected to parliament in 1942, 1945, 1949 and 1953.

During 1955 St. Laurent led the government in the second session of the 23rd parliament, which began on Jan. 7 and concluded on July 28. During this session the house approved the agreements which ended the occupation of western Germany and enabled the German Federal Republic to join the defensive alliance of the west. The government, under St. Laurent, set up a royal commission to inquire into and report upon the prospects for Canada's economic future.

In February, he was present at a meeting of commonwealth prime ministers held in London, Eng. In September the prime minister travelled west and took part in the golden jubilee celebrations of the provinces of Saskatchewan and Alberta. In April he presided over the preliminary meeting of the federal-provincial conference and again in October presided over the main conference which was called to discuss fiscal and other matters of concern to both federal and provincial governments.

During 1955 St. Laurent welcomed to Canada H.R.H. The Princess Royal and the Earl and Countess of Bessborough, and a considerable number of other distinguished visitors.

(H. E. K.)

St. Lawrence Seaway: see CANALS AND INLAND WATERWAYS.

St. Louis. St. Louis, Mo., covers an area of 61 sq.mi. on the west bank of the Mississippi river 15 mi. below the confluence of the Missouri. By the 1950 census it had a population of 856,796, with an additional 824,485 in the adjacent metropolitan area. Mayor of St. Louis in 1955 was Raymond R. Tucker, Democrat.

The need for greater civic progress inspired St. Louis voters to go to the polls on May 26, 1955, and approve overwhelmingly the largest public works program in the city's history. It called for a \$110,639,000 bond issue for 23 different kinds of projects from street expansion to erection of a planetarium. A \$16,395,000 bond issue was passed for school improvement on the same day.

An aldermanic election held April 5 resulted in a landslide victory for the Democrats, who won the presidency of the board and 12 of the 14 seats at stake. Their majority on the board increased to 24 to 4.

Public transportation passengers, subject to frequent fare increases in the past, were introduced for the first time to a zone fare system. An extra nickel was added for long rides, mostly beyond the city limits. The yield to the Public Service company, owner of the transit organization, was estimated at an additional \$177,000 annually. All bus and street car transportation was shut down, starting Oct. 11, by a wage dispute strike of operators.

Major crime in St. Louis increased during the first half of 1955—reports showing 14,918 offenses as compared with 13,738 during the same period of the previous year. This brought an investigation of the police department by a special committee of the Missouri legislature. Earlier the legislature had voted the police a pay increase averaging 15%, amounting to \$1,306,598 annually.

Fluoridation of the city water supply began late in the year. The September term saw a 2% increase in public school enrolment and completion, uneventfully, of racial integration in the elementary and high schools. An 8½-block blighted area on the edge of the downtown district was razed, with three blocks to provide a parkway connecting neighbouring Memorial and Aloe plazas and the rest to be used for private apartment houses. Work got underway and progressed toward completion on a new architecturally unique terminal building at Lambert-St. Louis Municipal airport costing \$5,250,000.

At the end of the fiscal year on April 11, 1955, the city government had a \$2,797,000 operating surplus, accumulated in two years. Operating cost for the fiscal year had been \$47,810,000, income \$49,467,000. The new 1955-56 budget was set at a record \$51,485,339. Real estate was assessed at \$1,185,000,000, an \$18,000,000 increase. The total tax rate (city, state and schools) was \$3.09 per \$100 valuation. (E. L. R.)

St. Lucia: see WINDWARD ISLANDS.

St. Pierre and Miquelon.

This French overseas territory consists of eight small islands off the south coast of Newfoundland. Area: 93 sq.mi. Pop. (1945 census): 4,354. Language: French. Religion: Roman Catholic. Chief town, St. Pierre, pop. (1945) 3,636. Administrator in 1955, Pierre Sicaud.

History.—Pierre Sicaud succeeded Irénée Davier as administrator in Jan. 1955. He decided that the islands' fishing fleet should be increased by two trawlers. In October he paid an official visit to Newfoundland. Joseph Lehuenen was elected mayor of St. Pierre. The 1955 budget was balanced at 303,000,000 fr. C.F.A., including a grant of 190,000,000 fr. C.F.A. paid by the French government. (HU. DE.)

Education.—(1954) Schools: state 8, pupils 547, teachers 32; private 9, pupils 702.

Finance and Foreign Trade.—(1954) Monetary unit: franc C. F. A. (Colonies Françaises d'Afrique)=2 metropolitan francs. In 1955 U.S. \$1=350 metropolitan francs. Imports 506,000,000 fr. C. F. A., including 282,000,000 fr. C. F. A. from Canada. Exports 169,000,000 fr. C. F. A., including 69,000,000 fr. C. F. A. to the United States (dried cod, 1952, 300 metric tons).

St. Vincent: see WINDWARD ISLANDS.

Salk, Jonas Edward (1914–), scientist, creator of a preventive vaccine against paralytic poliomyelitis, was born Oct. 28 in New York city. In 1939 he was graduated from New York university school of medicine. Three years later his demonstrated brilliance in bacteriological research won him a fellowship from the National Research council (from funds supplied by the National Foundation for Infantile Paralysis) which enabled him to work with Thomas Francis, Jr., virologist and epidemiologist at the University of Michigan, Ann Arbor.

In 1947 Salk joined the faculty of the University of Pittsburgh (Pa.) school of medicine as associate research professor in bacteriology. He also became director of the virus research laboratory. There, under a series of grants from the National Foundation for Infantile Paralysis, he worked first on classification of the poliomyelitis virus (1949-50) and then on development of a poliomyelitis vaccine.

In the preventive project his task was to bring to fruition knowledge gained through many years, including several momentous discoveries regarding the poliomyelitis virus, all prerequisite to creation of a vaccine. (See POLIOMYELITIS.) Indeed, until 1949 Salk himself had been seeking not a vaccine to protect against paralytic polio but rather one to prevent influenza.

"I think the time has come," he wrote to the National founda-

tion in 1950, "for initiating the critical experiments for immunologic prevention and more than that, the time has come for these experiments to be carried out in man."

For his vaccine he had the choice of trying to find strains of virus so weakened and attenuated as to be incapable of causing disease, and therefore suitable as possible "live" virus vaccines, or of using inactivated ("killed") virus—that is, virus subjected to chemical or physical treatment to bring it to a point where it could not cause paralysis. In either form the virus, by its presence in the human body, would stimulate production of protective antibodies and hence should prevent paralytic polio. He chose to use virus inactivated by chemical treatment (formaldehyde). One of the major problems then was to carry the process of treatment with formaldehyde to the degree necessary to assure safety, yet not so far as to vitiate the ability of the virus to stimulate production of antibodies.

In working out his formula Salk conducted thousands of experiments, first with animals, later with more than 9,000 human beings including himself, his wife and his three sons. In these and in exhaustive laboratory tests he proved the safety of the vaccine, but the measure of its effectiveness required a much broader trial.

Accordingly, in the spring of 1954 the vaccine was administered to 440,000 children in a nation-wide field trial sponsored by the National foundation. Detailed records were kept through the ensuing months on these and on 1,390,000 others who participated as controls. These data were the basis of an evaluation study by the Poliomyelitis Evaluation centre at the University of Michigan.

On April 12, 1955, at a scientific meeting in Ann Arbor, attended by many of the nation's leading scientists, results of the evaluation were announced. The Salk vaccine was declared safe and effective: 60% to 70% against paralysis caused by the type I polio virus, and 80% to 90% against that caused by types II and III. Thus the Salk vaccine was a historic breakthrough following a series of scientific assaults on the mysteries of poliomyelitis which had been carried on for decades.

In recognition of his work Salk was given a citation by Pres. Dwight D. Eisenhower on April 22, 1955, in which the president described the development of the vaccine as "a historic contribution to the welfare of humanity." Honours were conferred on Salk from many other sources, among them City College of New York, New York university, Roosevelt college, the American Therapeutic society, and the Commonwealth of Pennsylvania, which established the Jonas E. Salk chair of preventive medicine at the University of Pittsburgh with Salk himself the first appointee. On July 30 the U.S. congress passed a bill authorizing a special gold medal to be awarded to Salk.

(B. O'C.)

Salvador, El.

A republic on the Pacific coast of Central America, the smallest but most densely populated country on the isthmus, El Salvador has an area of 8,260 sq.mi. (of which 8,165 sq.mi. are land) and a population (1950 census) of 1,855,917 (1954 official est., 2,158,000). The capital is San Salvador, pop. (1950 census) 161,951, (1953 est.) 180,713. The 1950 populations of other principal cities are (1953 estimates in parentheses): Ahuachapán 10,294 (11,092), Chalchuapa 9,855 (10,557), Cojutepeque 10,015 (10,942), Mejicanos 9,389 (10,402), San Miguel 26,702 (28,730), Santa Ana 51,702 (56,952), Nueva San Salvador or Santa Tecla 18,313 (20,246), San Vicente 10,950 (11,795), Sonsonate 17,949 (19,070), Usulután 9,481 (10,512), Villa Delgado 13,331 (14,695) and Zacatecoluca 9,190 (10,023). Language: Spanish; religion: predominantly

Roman Catholic. President in 1955: Lieut. Col. Oscar Osorio.

History.—During 1955 El Salvador prepared to elect a new president to succeed Lieut. Col. Oscar Osorio who had led the country since 1950. His term was to expire on Sept. 14, 1956. Three candidates had been vying for the all-important presidential backing which would probably mean nomination by the government-sponsored Partido Revolucionario de Unificación Democrática, but Lieut. Col. José María Lemus unofficially seemed to have been selected by May 1955. However, the other two men were supported by newly formed parties: Lieut. Col. Rafael Carranza Amaya by the Partido Democrático Constitucionalista and Col. José Alberto Funes by the Partido Institucional Democrático. A fourth contender was Roberto Canessa, who hoped to rally a following through his Partido de Acción Nacional. There was also the possibility that Col. José Asencio Menéndez, who opposed President Osorio in 1950, might decide to run again at the head of his Partido Acción Renovadora. In accordance with the electoral laws, all candidates who held official posts resigned prior to Sept. 14, 1955, one year before inauguration.

El Salvador had long advocated closer relations between the Central American countries, the ideal being eventual political reunification. The most important step was the founding of the Organization of Central American States (*q.v.*). The Communist threat in Guatemala had delayed the organization's formal inauguration, but work began in earnest with the organizational meetings held in Antigua, Guatemala, from Aug. 18 to 24, 1955. Salvadorean Foreign Minister José Guillermo Trabanino was chosen as first secretary-general of the organization. (See also GUATEMALA.)

A significant Central American economic conference took place in San Salvador from May 4 to 9, 1955, under the auspices of the Economic Commission for Latin America of the United Nations. Several joint ventures were approved, of which the following were already being implemented late in the year: a paper mill for the highlands of Honduras; a technical and research institute to exploit local products and resources to be located in Guatemala; and a program to standardize customs and tariffs, looking toward a customs union for the area.

According to the United States embassy in San Salvador, a resurvey of El Salvador carried out in the last few years had revealed that the area of the country is probably no more than 8,000 sq.mi. instead of the 13,176 sq.mi. previously given. This would make it the smallest Latin-American republic instead of Haiti, and it would also mean a substantially greater population density. (R. HN.)

Education.—In 1954 there were 2,032 primary schools with 210,125 pupils, 95 kindergartens with 11,144 pupils, 126 secondary schools with 12,376 pupils and 418 centres for combating illiteracy. Primary teachers totalled 6,286; secondary 1,164. The national university had 1,315 students and 207 professors in 8 faculties. According to the 1950 census, 57.7% of those ten years of age and over were illiterate.

Finance.—The monetary unit is the colón, valued at 40 cents U.S. currency in 1955. The 1955 budget placed revenue at 155,531,934 colones and expenditure at 162,750,000 colones. In 1954 (preliminary figures) revenue was 165,300,000 colones and expenditure 151,950,000 colones. On Dec. 31, 1954, the external debt was 16,197,478 colones. Currency in circulation (July 31, 1955) totalled 91,980,000 colones; demand deposits, 95,590,000 colones. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$23,000,000, of which public utility investments accounted for \$17,000,000. The cost-of-living index (San Salvador) stood at 158 in May 1955 (1948=100).

Trade and Communications.—Exports in 1954 totalled 262,600,000 colones; imports, 216,900,000 colones. Leading exports were coffee (88%), cotton (6%), vegetable oils, livestock and cottonseed meal. Leading customers were the U.S. (72%), western Germany (11%), the U.K. (3%) and the Netherlands (3%); leading suppliers, the U.S. (59%), western Germany (7%), the Netherlands (6%) and Honduras (5%).

The two principal railroads have 385 mi. of main-line track, all narrow gauge. National highway mileage (1950) was 1,693, of which 934 mi. were all-weather. On Jan. 1, 1954, there were 10,551 automobiles and 4,702 trucks; telephones numbered 15,000, 75% of which were automatic.

Production.—Coffee production in the 1954-55 season was estimated at 1,325,000 bags of 132 lb. each; exports in 1954 were 996,000 bags. Other production estimates in 1954-55 included sugar 34,700 metric tons; cotton

90,000 bales of 480 lb. each; rice (rough) 75,000,000 lb.; tobacco (1954) 1,054,000 lb. In 1953 there were 827,430 cattle, 261,252 pigs and 20,451 sheep and goats. According to the 1950 industrial census, there were 11,106 industrial establishments, only 117 of which had more than 50 employees. Installed electric power capacity totalled 54,800 kw. in 1954. In 1954, 5,325 troy ounces of gold and 256,772 oz. of silver were produced. (J. W. Mw.)

Salvation Army. The movement which became known in 1878 as the Salvation Army originated in the Christian mission meetings conducted in London, Eng., 13 years previously by the Rev. William Booth, a Methodist minister. Its primary aim is to preach the Gospel of Christ to men and women who are untouched by ordinary religious efforts.

Internationally, the Salvation Army had by 1955 developed its religious and charitable program in 85 countries and colonies, preaching the Gospel in 81 languages and dialects and ministering through 16,900 chapels, or corps, as the organization terms the centres of work.

The world-wide activities of the Salvation Army are directed from London, where in 1955 Gen. Wilfred Kitching had his administrative office.

In the United States, the Salvation Army's organization is divided into four administrative areas with headquarters in New York city, Chicago, Ill., Atlanta, Ga., and San Francisco, Calif. Each area is under the supervision of a territorial commander. During 1955 Commissioner Donald McMillan, with headquarters in New York city, was the national commander and co-ordinator of work throughout the country.

In September there were 26,775 Salvation Army officers serving throughout the world, 5,138 of them being in the U.S.

In March 1955 the Salvation Army celebrated its 75th anniversary in the United States, and Pres. Dwight D. Eisenhower issued a proclamation recognizing a special National Salvation Army week.

In the United States there were 110 social service institutions ministering to the needs of men, providing shelter and work for approximately 46,000 homeless men annually. There were 34 maternity homes and hospitals, caring for about 14,000 mothers and infants annually, as well as four general hospitals. Aid to the unmarried mother and her child is one area of service in which the Army specializes.

In 1955 there were also 13 Evangeline residences for young businesswomen in the larger cities, as well as 100 homes and lodges for men, women and children. Summer camps provided rest periods for 35,000 mothers and children. A total of 1,476 missing persons were located during the year through the efforts of the four missing persons bureaus. In the area of prison work, nearly 8,000 inmates and their families were given assistance, and 2,734 prisoners were paroled in the care of Salvation Army officers.

The Salvation Army is one of the agencies comprising the United Service organizations, and in 1955 had 34 units under its particular management. More than 2,000,000 soldiers attended S.A.-U.S.O. clubs during the year. (Do. McM.)

Samoa, American. The Samoan Islands extend from 13° 26' to 14° 22' S. lat. and from 168° 10' to 172° 48' W. long., and are about 2,700 mi. E. of Australia and 2,200 mi. S. of the Hawaiian Islands. American Samoa consists of the inhabited islands of Tutuila, Tau, Olosega, Ofu and Aunuu, and the uninhabited coral atoll, Rose Island. Swains Island, 210 mi. N.W. of Tutuila and owned by one family, was made a part of American Samoa in 1925. Total area of American Samoa is 76 sq.mi. and total population was estimated as of June 30, 1954, at 21,600 with about four-fifths of the population on the main island of Tutuila. Pago Pago (pop. 1950 census, 1,586), on Tutuila, is the capital. About four-fifths of the

population is Protestant.

History.—American Samoa is an unorganized United States possession, administered by the department of the interior since July 1, 1951. Richard Barrett Lowe was governor in 1955; the secretary of American Samoa was Allan Macquarrie.

In 1954 a constitutional committee, consisting primarily of Samoans, was appointed to develop a law for American Samoa, aiming at eventual local self-government. For the first time provision was made for a complete governmental organization for Swains Island along substantially the same lines as for other villages of American Samoa.

Education.—It was estimated in 1954 that 99% of all persons 10 years of age or older were literate. As of June 30, 1954, there were 7,037 students enrolled in 61 public and 6 missionary schools. There were 189 public-school teachers and 24 missionary-school teachers. Expenditures for education during the fiscal year ending June 30, 1954, represented 16.5% of total expenditures.

Finance and Trade.—Imports in the fiscal year ending June 30, 1954, totalled \$992,543, of which the United States was the major source followed by Australia and New Zealand. Exports totalled \$546,238, of which two-thirds was copra and one-fifth canned tuna. Revenues collected during the 1953-54 fiscal year totalled \$524,970; expenditures amounted to \$1,627,324. The difference between revenues and expenditures was made up by a grant from the U.S. government. The Bank of American Samoa, which is a government institution, operated by the American Trust company of San Francisco, is American Samoa's only banking institution. As of June 30, 1954, it had a capital of \$50,000.

Transportation and Communications.—In 1954 Tutuila had 69 mi. of roads, of which 4 mi. were surfaced, and a 6,000-ft.-long coral-surfaced airstrip. There is no commercial air service, but Samoan Airlines planned to start service from this airfield in 1955 to fly between Western Samoa and American Samoa. About 1,400 tons of freight were carried by trucks in 1952. Land transportation consisted of 9 buses, 90 autos and 84 trucks. One radio broadcasting station, operated by the government, was in operation in 1955.

Production.—The main products of American Samoa are copra, fish and native handicraft, principally pandanus mats and rugs woven from grass. Principal crops, with estimated production for the 12 months ending June 30, 1954, were copra (1,097 metric tons), citrus fruits (100 tons), bananas (2,500 tons), breadfruit (2,400 tons) and taro (1,500 tons). An estimated 29,400 ac. were under cultivation. There were 287 cattle, 14,400 hogs and 66,900 chickens. (S. Nr.)

Samoa, Western: see NEW ZEALAND; TRUST TERRITORIES.

San Francisco. The population estimate for the city and county of San Francisco, Calif., as of Jan. 1, 1955, amounted to 805,000 persons, compared with 775,357 reported by the U.S. bureau of the census, April 1, 1950. The mayor of San Francisco in 1955 was Elmer E. Robinson, who was re-elected for a four-year term, commencing Jan. 8, 1952.

There were 123 public schools in the city in 1954 with an enrolment of 158,629 and a total average daily attendance of 84,720. Several thousand students attended private and technical schools. In 1954 there were 26,652 attending Catholic schools.

Total employment in the city in March 1955 amounted to 462,900. Retail trade based on taxable sales for 1954 amounted to \$1,480,307,000; sales of food for off-premise consumption and of gasoline, which are not included in taxable sales, would increase total sales in 1954 to about \$1,800,000,000. Wholesale trade in 1954 was about the same as in 1953 and amounted to \$4,876,000,000. The value added by manufacture in San Francisco in 1954 was estimated at \$720,000,000 compared with \$410,000,000 six years earlier.

The total foreign trade passing through the San Francisco customs district amounted to \$728,454,593 in 1954 of which \$403,696,502 represented exports and \$324,758,091 imports.

San Francisco's tax rate for the fiscal year 1955-56 was \$7.02 per \$100 assessed valuation. The assessment roll for the fiscal year was \$2,046,285,694. Estimated fiscal-year revenue amounted to \$197,312,174 of which \$89,092,566 would be derived from city taxes. The city's bonded debt limit as of June 30, 1955, based on the 1955-56 assessment, amounted to \$245,554,283. Bonds outstanding not matured on June 30, 1955, amounted to \$179,792,000. Margin for future bond sales June 30, 1955, was \$133,550,283. Bonds authorized but unsold June 30, 1955, amounted to \$51,235,000.

City officials of San Francisco proposed a capital improvement program for 1955-56 amounting to \$39,134,599 and for the five-year period 1956-61, amounting to \$158,983,774. The program in order of size of expenditures included water supply and distribution, traffic way signals and lights, Parking authority, recreation and parks, public health, sewers and disposal plants, municipal railway, police and fire protection and libraries and museums.

Some important events which occurred in San Francisco during the 1954-55 period included: the dedication of the \$10,000,000 passenger terminal building at the San Francisco International airport; the opening of St. Mary's Square garage, an underground six-story structure with a capacity for 1,025 cars and costing \$2,100,000; the opening of the Equitable Life Assurance society's new \$10,500,000 25-story building; the approval by the California Toll Bridge authority of the issuance of \$80,000,000 of bonds for construction of two new bridges in the immediate San Francisco bay area—one, a twin to the Carquinez bridge near Vallejo to cost \$46,000,000, and the other to replace the ferries between Martinez and Benicia and to cost \$34,000,000; the commemorative session of the United Nations, June 20 to 26. (R. B. Kr.)

San Marino. A small republic in central Italy (with which it is united by the customs union), San Marino is entirely surrounded by the province of Emilia and situated on the slopes of Monte Titano, 14 mi. southwest of Rimini. Area: 38 sq.mi. Pop. (1954 est.): 13,000. Language: Italian. Religion: Roman Catholic. San Marino is governed by two *capitani reggenti* appointed every six months by a grand and general council elected by universal suffrage every four years.

History.—The world's smallest and oldest republic remained under communist control during 1955. This was the result of the election of the grand and general council held on Aug. 14. The results, compared with 1951, were as follows:

ELECTION POSTERS lining a typical narrow street of San Marino, It., in 1955

Party	1951		1955	
	Votes	Seats	Votes	Seats
Communist	1,306	18	1,656	19
Left Socialist	991	13	1,338	16
Christian Democratic	1,922	26	2,006	23
Other	248	3	245	2
Totals	4,467	60	5,245	60

As in 1951 the Popular front over-all majority was only 77; the Christian Democrats brought about 200 Sammarinese from the United States, hoping that they would tip the scale. (Residence in San Marino is not a requirement for voting.) But the Communists and Left Socialists brought hundreds of voters from France, Belgium and northern Italy and increased their majority to 743. Women have no vote in San Marino.

Education.—Schools (1952): primary 18, pupils, 1,255; secondary 3, pupils 186.

Finance.—Budget (1954 est.): balanced at 150,000,000 lire. San Marino uses Italian currency. In 1955 the lira was valued at about 625 to U. S. \$1.

Santo Domingo: see DOMINICAN REPUBLIC.

Saskatchewan. Central of the three prairie provinces of Canada, Saskatchewan was created in 1905 by act of the federal parliament. Area: 251,700 sq.mi. Pop.: (1951 census) 831,728 (official June 1, 1954, est.) 889,000. Capital: Regina, pop. (1951) 69,928 (1955 est.) 80,000.

History.—The provincial legislature passed 89 public bills during the third session of the 12th legislature and approved resolutions seeking extension of the Prairie Farm Assistance act, the establishment of a board of livestock commissioners as a federal regulatory body, extension of the powers of the Canadian Wheat board to handle all grains, federal-provincial conferences to discuss agricultural problems and unemployment, and maintenance of the Crows Nest Pass Freight Rates agreement. Reductions averaging 25% were made in premium rates under the Saskatchewan Automobile Accident Insurance act, the previous deficit of \$1,881,551 having been wiped out. The royal commission on agriculture and rural life published five studies covering farm mechanization, farm costs, land tenure, agricultural credit, and rural roads and local government. Biggest natural resources developments centred on uranium and oil. During 1955 Saskatchewan celebrated the golden jubilee of the province, about 500 communities staging celebrations and attracting 3,000,000 or more persons. A large carry-over of wheat again created a storage crisis with a continuing shortage of ready cash in rural areas. Serious spring floods devastated much farm land in 1955. During 1955 a further 7,500 farms were served with electricity, bringing the total to 32,500.

Education.—During the 1953-54 school year there were 29,358 pupils attending secondary schools and 159,983 attending public schools making a total of 189,341. There were 7,480 teachers with an average daily pupil enrolment of 148,210. Total school operating revenues for 1953-54 totalled \$31,282,071.

Public Health and Welfare.—During 1954 the Saskatchewan Hospital Services plan, government-sponsored program of hospital care insurance, covered 97% of all persons entitled to participate. A total of 165,172 patients (excluding newborns) were admitted to hospital care under the plan. Total public assistance expenditure by the province, including old-age security supplementary allowance, blind persons' allowances, old-age assistance, mothers' allowances and social aid for 1954 was \$3,854,831.

Transportation and Communications.—At March 31, 1955, there were 162,495 passenger autos and 594 public service vehicles on 159,634 mi. of provincial and municipal road. Of this mileage 1,212 mi. were bituminous, 19,753 mi. gravelled. During 1954, 164,404 telephones were in service, which meant 18.7 instruments per 100 population.

Banking and Finance.—The 1955-56 provincial budget estimated revenues of \$79,992,920 and expenditures at \$79,971,810. As of March 31, 1954, net debt less sinking funds and revenue producing loans and advances, was \$94,022,000. In 1954 the two largest publicly-owned corporations, power and telephones, showed net earnings of \$3,386,000, while all other crown corporations together earned a net profit of \$763,000. At Dec. 31, 1954, there were 281 active credit unions, which loaned \$20,404,607 to 73,964 members.

Agriculture.—Main crops, 1954 (1955 preliminary estimates in parentheses): wheat, 151,000,000 bu. (298,000,000 bu.); oats, 86,000,000 bu. (140,000,000); barley, 53,000,000 bu. (109,000,000); rye, 6,700,000 bu. (8,400,000); flax, 4,800,000 bu. (13,100,000). Preliminary estimate of farm cash income for 1954 was \$473,094,000; valuation of major items: wheat, \$264,259,000; oats, \$25,340,000; barley, \$34,669,000; rye, \$6,333,000; flax, \$7,981,000; cattle, \$57,291,000; hogs, \$23,965,000; poultry, \$10,034,000; dairy produce, \$23,252,000. On June 1, 1954, there were 1,387,000 cattle and 539,000 hogs on Saskatchewan farms.

Fisheries, Furs and Forestry.—Commercial fish production in 1953-54 was 8,481,011 lb. valued at \$1,281,022. For the same year the timber cut, all types, was 28,355,923 cu.ft. valued at \$9,065,802. The total value of wild fur pelts for this period was \$1,383,310.

Manufacturing.—Statistics are for 1953 when 11,604 employees, in 1,062 establishments, earned \$32,395,518 in salaries and wages. Raw materials worth \$180,303,942 were converted into finished products with a net value of \$79,941,332 and a gross value of \$266,613,086. A breakdown of production statistics available for 1953 shows the four leading classes, in terms of value to be (number of employees in parentheses): petroleum products, \$67,777,002 (1,003); flour mills, \$42,911,324 (723); slaughtering and meat packing, \$31,879,941 (1,142); butter and cheese, \$28,008,313 (1,298). In 1953 the total value of all industrial products was \$266,613,086.

Mining.—During 1954 oil production was 5,422,899 bbl. There were 1,094 wells on production. Natural gas consumption was 4,824,265,000 cu.ft. with 120 wells on production. Preliminary value figures for all mineral production for 1954 was \$56,977,794. The leading minerals were copper, \$21,024,360; zinc, \$12,059,400; coal, \$3,956,000; gold \$3,391,703; petroleum, \$8,250,000. (J. H. Ar.)

Satellite, Artificial: see PHYSICS.

Saudi Arabia. Saudi Arabia is an Arab kingdom covering four-fifths of the Arabian peninsula. (See ARABIA.) Area: about 617,760 sq.mi. Pop. (1952 est., no census ever taken): 7,000,000. Religion: Moslem. Chief towns (pop., 1954 est.): Riyadh (cap.) 80,000; Mecca 150,000; Jidda 100,000; Hufuf 100,000; Buraida 50,000; Medina 45,000. King, Sa'd ibn Abd ul-Aziz al Saud. Prime minister and viceroy of Hejaz, Amir Faisal, crown prince and eldest brother to King Saud.

History.—The dispute between Egypt and Iraq over the latter's treaty of alliance with Turkey provoked an immediate declaration from the Saudi Arabian government that it was in full accord with Egyptian foreign policy and that were Egypt to secede from the Arab league, Saudi Arabia would also do so. Later the government accepted Egypt's invitation to subscribe to the new Egyptian-Syrian defense and economic treaty (see SYRIA); and in May King Saud threatened the Lebanese president (Camille Shamun) that unless Lebanon discontinued its efforts to force Syria and Jordan to accede to the Turco-Iraqi treaty, Saudi Arabia would retaliate politically and economically.

In Aug. 1955 there was a recrudescence of trouble between the Saudi Arabian and the British governments over the disputed ownership of the Baraimi oasis. The Saudi Arabian government had held up a convoy organized by Great Britain to carry relief supplies for the victims of an extensive fire in the Baraimi zone, and it was in this atmosphere of friction that the arbitration commission appointed in Dec. 1954 met in Geneva, Switz., in Sept. 1955. The British opened their case with charges of extensive bribery by the Saudi Arabian authorities to induce local sheikhs and notables to transfer their allegiance and their interest in the potentially rich oil fields believed to be in their territories from the sultan of Muscat and the ruler of the Trucial state of Abu Dhabi to Saudi Arabia. These allegations were denied by Saudi Arabia. But on Sept. 16 the British delegate, Sir Reader Bullard, resigned from the commission alleging the total lack of impartiality of his Saudi Arabian colleague, Sheikh Yusuf Yasin, the Saudi Arabian foreign minister, who, he had discovered, was the state officer in charge of affairs at Baraimi. This resignation was followed by that of the president, C. de Visscher (Belgium), and the tribunal closed. Thereupon levies from Muscat under British command reoccupied the oasis. The Saudi Arabian reaction was an official statement placing the responsibility for future developments on Britain.

(O. M. T.)

Education.—Schools (1949): primary 207, pupils 27,712, teachers 875; secondary 8, pupils 1,116, teachers 181; vocational 5, pupils 311, teachers 17; 1 preuniversity school, pupils 25, teachers 3.

Finance.—Monetary unit: rial; about 10.35 rials=£1 sterling and 1 rial=approximately 28 U.S. cents. Budget (1954-55 est. U.S. dollar equivalent): revenue U.S. \$305,940,000; expenditure U.S. \$361,330,000; estimated revenue from oil royalties and income tax U.S. \$257,700,000.

Foreign Trade.—Imports (1953 est.) £58,000,000; exports £235,000,000. Main imports: textiles, cereals, tea, coffee, sugar, rice, motor vehicles, building materials. Main exports: oil; also gold concentrates, hides and skins, gum, dates, clarified butter.

Transport and Communications.—Main roads (1954) Jidda-Mecca 72 km. asphalted; Jidda-Medina 168 km. completed; motor track Mecca-Persian gulf 1,325 km. Air transport: Saudi Arabian Airlines, 5 airports. Radio receiving sets (1950) 10,000.

Savings and Loan Industry. Savings and loan associations in the United States continued to make record progress in serving savings customers and in financing housing needs during 1955. Total assets, total mortgage loans held and total savings capital of all operating savings and loan associations reached new peaks.

In the year ended June 30, 1955, the increase in savings capital at all savings and loan associations amounted to \$4,700,000,000. This exceeded corresponding increases in other comparable forms of saving. During the same period the increase in time deposits at all commercial banks was \$2,200,000,000, and the rise in savings accounts at all mutual savings banks was \$1,900,000,000. Individuals increased their holdings of United States savings bonds by \$700,000,000 and their investments in life insurance reserves by \$3,900,000,000. Savings accounts with the postal savings system declined \$240,000,000 and with credit unions rose \$470,000,000. The increase in savings accounts at savings and loan associations comprised more than one-third of the total increase in these savings of individuals during the 12-month period.

Although new savings continued to flow into the savings and loan associations at a record rate during the year, withdrawals absorbed a high proportion. In the first nine months of 1955, gross savings receipts were \$10,300,000,000, 24% over the corresponding period in 1954. Withdrawals aggregated \$7,000,000,000, an increase of 33%. As a result, the net inflow of savings totalled \$3,300,000,000, or 9% more than in the same period a year previously. During the first nine months of 1955, the ratio of total withdrawals to gross savings receipts was 68%, as compared with the corresponding withdrawal ratio of 64% in the year before.

The growth in lending volume of the nation's savings and loan associations is indicated by the fact that mortgage loans acquired by insured associations were 39% greater in Jan.-Sept. 1955 than in the same period in 1954. Savings and loan associations continued as the leading lender for home financing, recording 38% of total home mortgage financing in the first nine months of 1955, with commercial banks next at 19%.

At the end of Sept. 1955 total assets of all savings and loan associations, somewhat more than 6,000 in number, amounted to \$36,200,000,000. Mortgage loans held came to \$30,600,000,000, with conventional loans constituting about two-thirds of the total. United States government obligations were owned in the amount of \$2,300,000,000, and cash holdings were \$1,600,000,000. Savings capital totalled \$30,500,000,000. Federal Home Loan bank advances approached \$1,300,000,000. Reserves and undivided profits exceeded \$2,500,000,000.

The imposition of credit restraints, particularly late in the third quarter, in face of very high mortgage demand, was a major event of the year. In usual circumstances, the net increase in mortgages held by savings and loan associations is made possible by the net increase in savings capital at these institutions. In the 12 months ended June 30, 1955, for instance, all savings and loan associations increased their total mortgage loans held in the amount of \$5,100,000,000, while total savings capital rose \$4,700,000,000. In the third quarter of 1955, however, the

"WE'RE ALL SET, GLADYS! . . . Your father gave us his blessing, this rabbit's foot, and the names of a couple of friendly loan companies . . ." a 1955 cartoon by Lichty of the Chicago Sun-Times Syndicate

increase in mortgage holdings substantially outran the net inflow of savings. During this period total mortgage loans held rose \$1,600,000,000, while total savings capital rose \$675,000,000, the excess of increase in the mortgage portfolio over the increase in savings capital being met by advances from the Federal Home Loan banks, by other borrowings and by drawing down of holdings of cash and government securities. It became increasingly apparent that the net inflows of savings together with repayments on outstanding mortgages were failing to keep pace with the very strong demands for new mortgage loans.

The Federal Home Loan Bank system, which had become an independent agency under the Housing act of 1955, has as a first duty that of providing additional liquidity to the member savings and loan associations by making advances when needed to meet unusual withdrawal demands. A second task is to assist, to some extent, the member savings and loan associations in meeting mortgage loan commitments. The Federal Home Loan Bank board on Sept. 8 adopted a policy of restricting the extension of credit through Federal Home Loan bank advances to member savings and loan associations. As a general rule it was required that each member association should follow a mortgage loan program that contemplated meeting loan demands out of savings inflow and loan repayments, and that a reasonable reduction in advances then outstanding should be required before renewal of outstanding advances. Later in the year the board authorized stand-by credits to member savings and loan associations as a relaxation of the September directive.

Secondary Metals. The by-products of other ores are classified as secondary metals. For instance, silver is obtained from ores mined primarily for their content of gold and from some of the base metals such as zinc. Gold, in many cases, is the by-product of copper mining and other base metals. Sometimes the production of the secondary metal exceeds the mine production as, for instance, secondary lead recovery has done for nine years. Included with by-product recovery is the metal recovered from old or new scrap. Old scrap is salvaged from irreparable or obsolete equipment. New scrap is primary metal produced in manufacturing processes which is reworked before final use. Recoveries of both types are shown in Table I, but only the recovery from old scrap adds to the available supply.

*Secondary metal recovered from old materials, the remainder having come from the reworking of new plant scrap. †Other platinum group metals.

Iron and Steel Scrap.—About half of the furnace charge in making steel is scrap and this, in turn, is about equally old and new scrap. Data for 1953 and 1954 on the plant (new) scrap and the purchased scrap are lumped together in Table II, as the U.S. bureau of mines does not now report them separately.

(F. E. H.)

Table II.—Scrap in the U.S. Iron and Steel Industry

	Pig iron output	Steel output	Plant	Scrap consumption Purchased	Total
1939	34,895	46,079	19,622	16,705	36,327
1946	44,842	66,603	26,134	23,350	49,484

Secret Service, U.S. The United States secret service is a bureau of the treasury department, established July 5, 1865. Its powers and duties are defined in title 18, U.S. code, section 3056. They include protection of the president of the United States and members of his family, the president-elect and the vice-president at his request; the suppression of currency counterfeiting and of forgeries of

government checks and bonds.

During the year ended June 30, 1955, secret service agents captured 16 plants for the manufacture of counterfeit paper money and \$1,021,916 in counterfeit bills. Of that total, only \$102,482 was successfully passed on storekeepers and cashiers. The balance of \$919,434 was captured before it could be put into circulation. The representative value of counterfeit coins seized was \$5,262.76, of which \$4,975.32 was successfully passed. There were 124 new counterfeit note issues during the year, and 186 persons were arrested for violating the counterfeiting laws.

There were 33,260 forged government checks received for investigation, an increase of 1,329 over the previous year, and 12,139 were on hand as of July 1, 1954. Agents completed investigations of 30,177 forged checks worth \$2,609,335.91, but on June 30 there was a growing backlog of 15,222 forged checks awaiting investigation. Agents arrested 2,825 persons for forgery of government checks.

Thieves continued to steal and forge United States savings bonds. Agents received 5,607 forged bonds for investigation and there were 2,063 such cases awaiting investigation July 1, 1954. Agents completed investigations of 4,961 forged bonds worth \$437,103.54 and arrested 86 persons for bond forgery. Many of the bonds were stolen by burglars from private homes where the bonds had been concealed in shoe boxes, bureau drawers and other makeshift hiding places.

Secret service agents arrested 172 persons for crimes other than counterfeiting and forgery, making a total of 3,269 persons arrested, an increase of 157 or 5% over the previous year. There were 2,979 convictions, representing 98.1% of convictions in all cases prosecuted, some of which were pending from the previous year.

Prison sentences during the year totalled 3,159 years, and additional sentences of 2,715 years were suspended or probated. Fines in criminal cases totalled \$61,242.

Cases of all types received for investigation aggregated 43,990, an increase of 2,627 or 6.4% over the previous year. Although 40,627 cases were closed during the year, there were 18,585 cases awaiting investigation and 956 pending prosecution as of June 30, 1955.

Securities and Exchange Commission.

A bipartisan, quasi-judicial agency of the U.S. government, the Securities and Exchange commission (SEC) administers several laws in the general field of securities and finance enacted for the protection of the investing public.

Securities Act of 1933.—This law prohibits fraud and deceit in the sale of securities generally; provides recovery rights to defrauded investors; and requires disclosure of financial and other information concerning securities offered for public sale. Such disclosures are obtained through the filing of registration statements with the commission containing pertinent data essential to informed investment analyses, and the delivery to investors of a prospectus setting forth the salient facts. At the end of the 1955 fiscal year, \$103,000,000,000 of securities had been registered, \$10,900,000,000 during that year.

Registration of securities does not guarantee against loss in their purchase. It seeks to provide investors with information upon which they may make an informed analysis of the securities and prudent investment decisions based thereon. Nor is registration a warranty of the accuracy of the facts disclosed; but investors who suffer losses in the purchase of registered securities have important recovery rights if the facts are misrepresented.

Securities Exchange Act of 1934.—Issuers of securities listed for public trading on national securities exchanges are required by this law to register and file periodic reports disclosing financial and other information required by investors for informed investment decisions. At the year's end, 3,658 security issues of 2,219 issuing companies were so listed and registered, and the volume of trading therein during the year was approximately \$37,977,338,870.

Holders of listed securities also must be provided with pertinent information when their proxies are solicited on corporate matters. In addition, management officials and large stockholders of listed companies must report their transactions in the equity securities of their companies and are accountable to the issuer for short-term trading profits therein—measures designed to curb misuse of “inside” information. During the year, 1,934 proxy statements and 28,975 insiders' reports were filed.

This law further provides a system for the regulation of securities markets designed to eliminate all impediments to free and open markets; and the commission exercises a continuing surveillance in furtherance of investor protection in accordance with the prescribed standards. Exchanges as well as brokers or dealers in an over-the-counter securities business must register and conform their business practices to the requirements of the law and rules of the commission promulgated thereunder; 15 exchanges and 4,334 brokers and dealers were registered at the year's end. Also registered was one association of brokers and dealers which, like the exchanges, has disciplinary powers over its members.

Public Utility Holding Company Act of 1935.—This law provides for regulation of holding company systems of electric and gas utility companies in the interest of protecting investors and consumers against certain abuses which led to its enactment, and it also seeks to delimit the scope of each system's operations to an integrated system of utility properties and to simplify their corporate and capital structures and redistribute voting power on a fair and equitable basis. Among such abuses were the issuance of securities against unsound values; inadequate disclosures to investors; exorbitant service charges; overloading of subsidiaries with debt; absentee management and control, often through disproportionately small investment; and extension of holding company systems without regard to economics of operation. Many of these had the effect of thwarting effective state regulation.

The integration and simplification program, virtually complete, saw the divestment of widely separated properties not retainable with the integrated properties of particular systems and the simplification of pyramided corporate and complex capital structures and redistribution of voting power among security holders upon an equitable basis, all in keeping with the statutory requirement of fair and equitable treatment of security holders affected. As an over-all result of this process and the granting of related exemptions, 1,958 of the 2,200 companies which had been subject to the statute as components of registered holding company systems were released from jurisdiction as such, including 425 electric and gas utility companies with assets of more than \$10,000,000,000, most of which emerged as independent operating companies. The process also tended toward the restoration of local management and control and more effective state regulation. Ultimately, it was expected that about 18 holding company systems with assets of \$6,500,000,000 would continue as registered systems subject to commission regulation under the act, which regulation would supplement that of state commissions.

The law also prescribes standards governing mergers and consolidations, purchase of utility securities and assets, issuance and sale of securities, servicing contracts and similar matters;

these must be passed upon by the commission in accordance with the terms of the law. One of the important duties of the commission over the past several years had been to consider, in terms of these provisions of the law, the issuance of securities by system companies to finance their businesses, including unprecedented expansion programs. During recent years annual financings by registered systems had approximated \$1,000,000,000, of which \$750,000,000 represented sales of securities to the general public and the balance intrasystem sales.

The commission also administers the Trust Indenture act of 1939, the Investment Company act of 1940 and the Investment Advisers act of 1940, and serves as adviser to federal courts in corporate reorganization proceedings under chapter x of the Bankruptcy act. (O. L. DuB.)

Seeing Eye, Inc.: see SOCIETIES AND ASSOCIATIONS, U.S.

Segni, Antonio (1891—), Italian politician, was born at Sassari, Sardinia, Feb. 2. He succeeded Mario Scelba as prime minister of Italy on July 6, 1955. A lawyer with a degree in agricultural and commercial law, he joined the Christian Democratic party in 1919 (then called Partito Popolare Italiano) and worked as an organizer in the provinces. In 1924 he was a member of the party's national council, but two years later all political organizations were dissolved by Mussolini. Segni taught agrarian law for 17 years at the universities of Pavia, Perugia and Cagliari; he was also rector of Sassari university. At the beginning of 1943 he was one of the organizers of the revived Christian Democratic party in Sardinia. He joined the second I. Bonomi cabinet (Dec. 1944–June 1945) as undersecretary to the minister of agriculture, retaining this office in the F. Parri cabinet (June–Dec. 1945) and in the first A. de Gasperi government (from Dec. 9, 1945). Segni was elected to the constituent assembly for Cagliari (June 2, 1946) and on July 12 was made minister of agriculture in the second De Gasperi cabinet, keeping this portfolio in the following three De Gasperi ministries. Re-elected on April 18, 1948, he continued to serve as minister of agriculture in the sixth and seventh De Gasperi cabinets. He prepared and put into practice the Land Reform bill. In July 1951 he was appointed minister of education in the eighth De Gasperi cabinet. Re-elected to the chamber of deputies in June 1953, he joined the G. Pella cabinet (Aug. 1953–Jan. 1954) again as minister of education. On July 6 he formed the 17th postwar Italian cabinet, a coalition of Christian Democrats, Liberals and Social Democrats.

Seismology. Seismologists consider the 12-month period ending Oct. 15, 1955, to have been one of less than normal earthquake activity. There were, nevertheless, a number of damaging shocks. One on April 1, 1955, in the southern Philippines, was a major disaster with an estimated death toll of 432. During eight hours, recurring shocks rocked the island of Mindanao, resulting, besides the death toll, in several million dollars' damage to property and crops in the Iligan, Ozamiz and Lake Lanao areas. Highways were closed by great cracks, some three to four feet wide, and by landslides and huge fallen boulders. Lake Lanao, one of the largest in the Philippines, lowered about six feet, and houses toppled into the water.

Greece, one of the most seismically active lands in the world repeatedly struck in recent years by devastating earthquakes suffered again when, on April 19 and 21, 1955, a series of quake destroyed parts of Volos, a principal seaport and industrial city. A U.S. destroyer in the harbour rendered emergency assistance to thousands of inhabitants forced to spend the night in rain

drenched streets. After the shocks on April 21, 65% of the inhabitants were homeless.

Perhaps the most important quake from the scientific viewpoint occurred on Dec. 16, 1954, when great ground displacements occurred on geological faults east of Fallon, Nev. Vertical displacements of 6 to 23 ft. and horizontal shifts of 4 to 12 ft. occurred east of Fairview Peak, and movements as great as 15 ft. took place on the west side of Dixie valley. These displacements, which required extensive readjustments to the coast and geodetic survey control network of Nevada, were the greatest noted in North America since the great Yakutat, Alaska, quake of 1899, and rank among the greatest of history. Such a shock in a populated area would be a major catastrophe.

Other quakes occurred in widely separated areas. Beginning Dec. 4, 1954, a series of more than 100 shocks killed one person, injured several and made thousands homeless in Trinidad. Two million dollars' damage to public and private buildings in Eureka, Calif., was caused by a quake on Dec. 21, 1954, which impaired telephone service and power and radio station operations.

Quetta, Pak., the scene in 1935 of one of the greatest earthquakes of history, was shaken on Feb. 19, 1955, by tremors which killed 12 persons and drove thousands from their homes to spend the nights in the streets. On April 14 at least 39 persons were killed and 113 injured according to unconfirmed reports from Sikang province, China. On July 16 a strong tremor struck Samos Island, 175 mi. S.E. of Athens, collapsing 90 houses. It also caused the death of two persons and wrecked more than 700 houses on Turkey's Aegean coast.

On July 20 heavy damage and some injuries occurred in the lofty mountains of northern Ecuador, where a new church and many adobe houses were collapsed by a shock felt sharply in Quito. A few days later, on July 28, more than 20 quakes tumbled scores of homes in Valdivia, Chile, as two dormant volcanoes became active. Water was contaminated by volcanic ash which endangered thousands of cattle and sent 200 persons to hospitals with smoke poisoning.

A sharp earthquake jolted the thickly populated Nile river delta area on Sept. 12, killing 20 persons, injuring many and causing extensive damage. Eight houses and two school buildings collapsed. Nine school girls were killed when a panic-stricken class surged down the stairs and broke through a balustrade, plunging to the floor below.

An interesting geophysical and geological investigation, using seismic techniques, in the Gulf of Mexico showed the southern Gulf to be a typical oceanic area modified by sedimentary loadings. Cores taken in depths of more than 1,700 fathoms showed a three-foot layer of recent sediments from Wisconsin, outlining the extremity of the Wisconsin glacial epoch.

New seismological stations were established at Akureyri, Ice., Comitán, Mex.; Eureka, Nev.; and O'Higgins base, Antarctica. Telemetering of seismic recordings over a microwave radio link was improved by the coast and geodetic survey, using a UHF-FM system with commercial types of transmitters and receivers. This provides the advantage of locating seismometer detectors in remote, undisturbed areas, while actually recording the tremors at convenient central points.

Trends in engineering practices for building construction to resist earthquake forces were evident in San Francisco, where use was being made of tapered columns and spandrel beams resembling butterflies because they are deeper at the ends than the middle. Other developments were an earthquake-resistant tank where ring girders form the floors to provide seismic bracing, and a nine-story reinforced-concrete parking garage in which a prestressed I-shaped shear wall was designed to withstand 68% of the total estimated horizontal force caused by an

earthquake occurring at the worst angle. (See also COAST AND GEODETIC SURVEY; DISASTERS.) (E. B. R.)

Selective Service, U.S. The United States Selective Service system was assured of uninterrupted operation when on June 30, 1955, Pres. Dwight D. Eisenhower signed into law a bill extending until July 1, 1959, the system's authority to induct regular registrants. The same act extended until July 1, 1957, the authority of Selective Service to induct doctors and dentists for the armed forces. Both were to have expired as of June 30, 1955.

Another amendment provided for exemption from training and service but not from registration, in accordance with regulations prescribed by the president, of certain aliens who subsequent to June 24, 1948, served on active duty for a period of not less than 18 months in the armed forces of a nation with which the United States is associated in mutual defense activities as defined by the president.

A further provision exempted from induction for training and service, "except after a declaration of war or national emergency made by the Congress subsequent to the date of enactment of this title," persons who after Sept. 16, 1940, served honourably on active duty for not less than one year in one of the armed forces; those who subsequent to Sept. 16, 1940, were discharged for the convenience of the government after having served on active duty for a period of not less than six months; and those who served for a period of not less than 24 months as commissioned officers in the public health service, or in the coast and geodetic survey.

In extending the so-called "doctor draft," the congress provided that no person in the medical, dental and allied specialist categories shall be inducted after he has attained the 35th anniversary of the date of his birth if he applies or has applied for a commission in one of the armed forces in any such categories and is or has been rejected for commission on the sole ground of physical disqualification. It also lowered from 50 to 46 the maximum age for the induction of individuals in these categories.

During the calendar year 1955, the armed forces called upon Selective Service to supply a total of 153,000 men, 133,000 of whom were for the army and 20,000 for the navy. For the first time since Dec. 1945, the navy called upon Selective Service to furnish 10,000 men in November and 10,000 in December.

In keeping with the expressed intent of the congress, Selective Service, immediately following enactment of the Reserve Forces act of 1955, began preparation for carrying out its responsibilities in the administration of that program. Some of this responsibility is concerned with the records which must be assembled and maintained for members of the standby reserve and the part which the Selective Service system must play in the extension of the ready reserve. The possible mobilization of the Standby reserve would require that there be established individual records for each standby reservist. These records must be complete enough at all times to permit a current classification to be available so that if a mobilization should come at any time, the Selective Service system would be able to indicate to the department of defense what standby reservists were immediately available for mobilization.

The make-up of the Selective Service system remained materially unchanged through the calendar year 1955. There were approximately 4,000 local boards, 92 appeal boards, plus 28 panels (1 in each federal judicial district in each state, territory and possession), 56 "state" headquarters (1 in each state, New York city, District of Columbia, Hawaii, Alaska, Puerto Rico, the Virgin Islands, Panama Canal Zone and Guam), and a national headquarters in the District of Columbia. Uncompen-

sated personnel of the system, including local board members, appeal board members, government appeal agents, advisors to registrants and medical and scientific advisors to local boards all serving without pay, totalled 40,000 as against approximately 8,000 paid personnel. (L. B. H.)

Reserve Forces Act of 1955.—The Reserve Forces act of 1955, which became law on Aug. 9, added three significant features to existing statute governing military reserves.

First, it modified the structure of the reserve forces to permit establishment of a ready reserve adapted to the world strategic situation, and to permit, through a process of screening the ready reserve and selective mobilization of the standby reserve, the proper distribution of critically skilled personnel between military and defense-supporting requirements in the event of mobilization. Second, it provided an effective means for securing compliance with the requirement to take part in the reserve training imposed on young men who entered the armed forces after Aug. 9, 1955. Third, it provided a method for the direct entry of young men into the reserve and their initial active training for effective reserve participation.

Including provisions added to existing law by the Reserve Forces act of 1955 and associated legislation, a young man between the ages of 17 and 18½ has available to him a number of choices by which he may fulfil his military obligation:

(1) He may enlist in a regular component for three or more years of active service in which case he acquires an obligation for six years of active and reserve service.

(2) He may enlist in the army for two years, assuming the six-year obligation.

(3) He may volunteer for induction by Selective Service for two years of active duty within a total six-year obligation.

(4) He may enlist in the reserve for six years with the agreement to serve two years on active duty during his obligation.

(5) He may enlist in the reserve for eight years, undergoing six months of initial active duty for training followed by draft-deferred membership in the Reserve for the remainder of eight years contingent on satisfactory participation.

(6) He may join the national guard and, without undergoing initial active training, complete his military obligation in a draft-deferred status by satisfactory participation with his national guard unit until age 28. By undergoing six months of active duty for training, however, he may fulfil his obligation in eight years. Subject to presidential authorization, the law made similar provisions by which young men may enter the reserve.

(7) He may enroll in the reserve officers training corps or other college-type training program, and complete college in a draft-deferred status; and upon being commissioned, serve a minimum of two years of active duty within a six-year obligation or six months of active training within an eight-year obligation, depending on service requirements. (See also LAW.)

Seventh-day Adventists. In 1955 the church reached a world membership of more than 1,000,000. As of Sept. 30 the membership in the United States and Canada was 291,368. At the annual autumn meeting of the executive committee, which legislates for the church, these actions, among others, were voted: that steps be taken to train more effectively the personnel to direct the Pathfinder clubs, which are composed of junior youth; that the church members give special attention to circulating among their Jewish friends a new journal launched by the church, called the *Isra-*

elite, which seeks to set forth the teachings of the Christian faith; that the church record its vigorous opposition to the serving of liquor on commercial passenger planes; that it oppose the use of hypnosis in the treatment of disease. The concluding topic of the annual autumn meeting was the setting of the budget for 1956. Appropriations totalled \$20,814,801, an increase over the preceding year of more than \$500,000. These appropriations were largely for the maintenance of overseas work, and they did not include the maintenance of North American churches or pastors.

A historical high light of the year was the 50th anniversary of the denomination's medical college, located at Loma Linda and Los Angeles, Calif., which was in the midst of a multi-million-dollar expansion program. Dedicated during the year, on the Loma Linda campus, was a building to house the dental college. The welfare agencies of the church, through its Dorcas societies, were called into active service in connection with the disastrous hurricanes and floods that struck the northeastern part of the United States. (See also CHURCH MEMBERSHIP.) (F. D. N.)

Seychelles. British colony and dependencies, 92 islands in the Indian ocean. Area 156 sq.mi. (Mahé 55 sq.mi.). Pop.: (1947 census) 34,632; (mid-1954 est.) 37,391, mainly Negro. Language: English; French Creole patois. Religion: Christian (about 66% Roman Catholic). Capital, Victoria (Mahé Island), pop. (1952 est.) 10,000. Governor in 1955, Sir William Addis.

History.—Development work in Seychelles costing £730,000 was planned for 1955–56. During 1955 a local businessman obtained a lease of the Aldabra Islands (about 750 mi. S.W. of the main Seychelles group), under conditions to preserve rare flora and fauna. The dried fish trade expanded—Ceylon and Malaya placing orders—and the marketing of essential oils benefited from the formation of an association of their producers, distillers and shippers.

Considerable controversy was caused in July by the suspension and exclusion from the colony by his bishop of Ven. C. A. Roach, Anglican archdeacon of Seychelles, who was on furlough in England. Archdeacon Roach had repeatedly alleged religious persecution and undue governmental influence by the Roman Catholic majority. (J. J. Ty.)

Education.—(1954) Government and mission schools: primary 32, junior secondary 2, secondary 2 (with primary departments), vocational 1; all pupils 5,740; all teachers (excluding private) 146, student and pupil teachers 70.

Finance.—Monetary unit: Seychelles rupee, equal to 1s. 6d. sterling and 21 cents U.S. Budget (1954 actual): revenue Rs. 3,800,422; expenditure Rs. 3,764,270.

Foreign Trade.—(1954) Imports Rs. 8,086,860; exports (including re-exports, Rs. 33,432) Rs. 9,081,859. Production (long tons 1954): copra 6,472; cinnamon leaf oil 99; cinnamon bark 475; patchouli leaf (dry) 67; vanilla 1,370 kg.; guano (including phosphate rock) 11,863 long tons.

Sheep: see LIVESTOCK.

Shipbuilding. The total world tonnage under construction or on order of vessels of 1,000 gross tons or more as of July 1, 1955, was 6% above the July 1954 total. The figures shown in the table, released by the Shipbuilders Council of America, do not include construction in the U.S.S.R. or satellite countries.

The world shipbuilding gross tonnage of 12,596,534 was an increase of 721,217 gross tons over July 1954.

United States.—The United States position in world shipbuilding slipped further during 1955, from eighth to tenth place. In many individual European shipyards there were more ships under construction than in all the shipyards of the United States. On Jan. 1, 1955, 15 merchant vessels (1,000 gross tons and

"EMPRESS OF BRITAIN," 26,000-ton ocean liner of the Canadian Pacific fleet, under construction near Govan, Scot., in June 1955

over) aggregating 212,660 gross tons were on order, under construction or awaiting delivery in domestic shipbuilding yards. These included ten tankers, three cargo vessels, one ore carrier for Great Lakes service and one new cargo vessel undergoing conversion and completion as an auxiliary cargo attack vessel for the navy.

During the first nine months of the year eight new vessels were delivered. They consisted of four tankers, three "Mariner"-class C4-S-1a cargo vessels and one Great Lakes "self-unloader" bulk ore carrier. During this period only three vessels were launched, including two tankers and the last of the "Mariner"-class cargo vessels. In the same months of 1954 there had been 27 vessels launched and 30 delivered.

Of the 20 vessels ordered since Oct. 1954, 13 were tankers aggregating approximately 210,000 gross tons. Four of these tankers were being built under the 1954 authorization of public law 575 for use by the Military Sea Transportation service, and two additional small ice-strengthened tankers were being built for use in the logistical supply of arctic bases. One tanker was being built for a private firm to replace tankers which had been sold to foreign owners, and six tankers were being built for private firms to replace tankers which had been traded in to the Maritime administration for placement in the reserve fleet as authorized in 1954 by public law 574. One small ore carrier was being built for private account for use in South America, as well as a passenger-auto ferry for use between New Bedford, Martha's Vineyard and Nantucket.

Five more vessels were currently being built under authorization of public law 458 as a part of the program of navy shipbuilding and conversion, fiscal 1955. These five consisted of a prototype "roll-on-roll-off" vessel, a special-purpose cargo ship dock and three small ice-strengthened cargo ships. Because of the commercial design of these vessels, even though they were ordered for use by the navy, they were listed as commercial construction.

Of the total of 41 commercial ships authorized by the congress in 1954, only 17 were under construction as of late 1955. The congress during 1955 enacted additional legislation, sponsored by the Maritime administration, which raised the total of vessels authorized to 59.

Bureau of labour statistics figures showed that there were 123,600 persons employed in private U.S. shipyards as of Jan. 1954. In Jan. 1955 employment had decreased to 98,200 but by July had recovered to 102,000. Average hourly earnings in the shipbuilding and repairing industry, according to the bureau of labour statistics, during June 1955 were \$2.18 as compared with \$2.13 in 1954. The average weekly hours worked also were

greater in 1955 than 1954, 39.3 compared with 38.8.

Because no new orders for seagoing commercial vessels were received during all of 1953, 6 only during the latter part of 1954 and only 14 in 1955 (to Oct. 20), the amount of new work had not been sufficient to provide any continuity of work in the shipyards. The yards survived primarily because of the naval program of construction started during 1954. The contracts let by the navy department during the first nine months of 1955 totalled approximately \$115,000,000, one-third the value of those let during 1954. The 1955 awards were for six LST's, a nuclear submarine, a cable ship conversion and a number of small boats.

The fiscal 1956 navy construction program, which was authorized by the congress in public law 157, proposed the construction of 28 vessels, ranging in size from an attack aircraft carrier to an inshore minesweeper, as well as more than 1,000 small service craft.

Construction of nonpropelled craft used along coastal and inland waterways, such as barges, scows and carfloats, during the first eight months of 1955 was reported at 315,875 gross tons, compared with 186,725 tons for the same period of 1954. Construction of self-propelled small craft such as towboats, tugs and trawlers also increased from 10,128 gross tons for the first eight months of 1954 to 20,405 gross tons for the same period of 1955. (H. G. S.)

Great Britain and Other Countries.—A marked change in the position of the world shipbuilding industry occurred during 1955. In the previous year there had been a noticeable falling-off in the number of contracts placed for new ships, accentuated by actual cancellations of existing orders, but in the last quarter of 1954 there appeared the first signs of what developed into a spate of ordering. Foreign shipowners, principally Norwegian, suddenly began reserving berths, mainly in European shipyards, where fixed prices and promises of early delivery were then obtainable. These orders were almost invariably for dry-cargo ships of the tramp type.

In the first part of 1955 this tendency spread, with the result that fixed prices and early delivery became less and less easy to obtain; even United Kingdom yards, which could rarely offer delivery before 1958 because of the huge backlog of existing orders, began to receive more contracts. Many of the new orders were for ore carriers, in anticipation of a substantial

Merchant Shipbuilding in Principal Countries of the World, July 1, 1955

New Construction in Hand or on Order (1,000 gross tons and over)

increase in world-wide demand for ships of this type during the next five years.

By the middle of 1955 it became apparent that these orders for dry-cargo ships might prejudice the position of the major oil companies, since the world demand for oil transport also

promised considerable expansion. Few orders had been placed by tanker operators for delivery after 1957, and in the second half of 1955 millions of tons of new tankers were contracted for, with delivery up to the end of 1960. Within the space of one month the Shell group announced the placing of contracts with British and Dutch yards for an initial program of 34 tankers of 18,000 or 32,000 tons dead weight; other oil groups followed suit; and new ground was broken by a British liner group, the Peninsular and Oriental Steam Navigation company, by ordering 25 tankers from U.K. shipyards on behalf of itself and its subsidiaries.

Meanwhile, shipbuilding costs in most countries continued to rise. In the United Kingdom costs were substantially increased as a result of an increase of nearly 6% in the price of steel suitable for shipbuilding, mainly because of increased costs of transport and coal. Wages in the shipbuilding and engineering industries were subjected to an advance of 10% early in the year, and six months later a demand for a further 10% increase was lodged.

Several interesting ships were launched during 1955 including the new "Empress of Britain" (26,000 tons gross), which was launched from a Clyde yard by Queen Elizabeth II. This ship, together with a sister ship under construction on the north-east coast, was designed for the Canadian Pacific line's North Atlantic service between Great Britain and Canada. Other large passenger liners launched were the "Reina del Mar" (19,350 tons gross) for the Pacific Steam Navigation company's service between Liverpool and the Pacific coast of South America, and the "Bergensfjord" (18,500 tons gross) for the North Atlantic service of the Norwegian American line.

Large ships completed included the Cunard passenger liner "Ivernia" (21,600 tons gross) and the Netherlands whaling factory ship "Willem Barendsz" (26,150 tons dead weight), the largest merchant ship so far built in the Netherlands. Tankers up to about 45,000 tons dead weight continued to predominate in the shipyards, but specialized ore carriers became commoner. Among those launched were the "Sept Iles" and "Leader," each of about 32,000 tons dead weight, built in England for Canadian and U.S. owners, respectively. The new merchant fleet of Israel received several vessels built in Germany under reparations agreement, including the "Israel" (10,500 tons gross), the first of two similar passenger and cargo liners intended for service between Haifa and New York.

Shipping, Merchant Marine: see MERCHANT MARINE.

Shoe Industry. By the third quarter of 1954 the outlook for shoe production in the United States had improved considerably, and with increased activity in the months of November and December the final figures for that year were within 2% of the record high production of 1953. There were 523,996,000 pairs of shoes produced in 1954 as compared with 532,031,000 in 1953.

Production continued upward in 1955, there being 395,229,000 pairs of shoes made during the first eight months of the year as compared with 352,523,000 for the same period of 1954. At that rate the total for the entire year 1955 would be approximately 560,000,000 pairs of shoes.

Retail sales for the first six months of 1955 were 5% ahead of the same period in the previous year, and it was estimated that the gain for the entire year would be nearly 10%. Inventories at retail were in good shape and the price structure was favourable. Increases in leather costs edged prices up slightly, in some cases, but in general manufacturers and merchants absorbed the increases and did not pass them on to the consumer.

New styles in each category—men's, women's and children's—had considerable influence in creating greater consumer demand. Women's shoes were light and flexible, with soft construction

Table I.—Shoe Production in the United States

Pairs	1954	Jan.-Aug. 1955
Women's shoes	245,519,000	195,890,000
Men's shoes	94,485,000	72,102,000
Misses' and children's shoes	67,896,000	47,182,000
Boys' and youths' shoes	19,471,000	15,408,000
Infants' and babies' shoes	36,291,000	24,852,000
All other shoes	60,334,000	39,795,000
Total	523,996,000	395,229,000

and a glovelike feel that ensured better fit. Interest in heels in the mid-height range was considerable. The stacked heel on the new version of "spectator" and tailored shoes gained in popularity, and the variety of heel heights was matched by the materials used—glass, aluminum and wood, in addition to conventional covered heels.

Textured-grain leathers, new suèdèd leathers, matte-, dull- and lustre-finish leathers, as well as printed leathers, all played an important part in women's shoes. Vinylite, both clear and in the tortoise-shell shades, continued to be popular, especially in the open-toe, open-back styles on high glass or lucite heels.

Manufacturers and retailers of men's shoes concentrated their efforts on low cut, the Italian influence, slimmer lines and soft-grain leathers, and the customer response was good. Black shoes to go with the dark suitings and separate jackets in men's apparel gained in popularity during the year over the charcoal colours.

The children's shoe category proved to be the most profitable branch of the industry during the year. Preferences were for colours and patterns that closely resembled the styles for adults.

Leather supplies and demand were in favourable balance during the first ten months of 1955. The large domestic production of hides and skins kept raw materials prices stable, and market changes were minor.

World per capita output of leather footwear increased from

Table II.—World Footwear Production

(In thousands of pairs)		Per capita		Per capita	
	1940	1952	1954	1954	1954
North America	444,383	2.40	572,814	2.60	603,815
South America	51,892	.57	71,447	.62	75,742
Europe	455,131	.90	498,081	.86	502,368
Asia and Oceania	63,088	.05	100,258	.07	98,171

Source: Business Information Service, U.S. Department of Commerce.

0.47 pairs in 1940 to 0.60 pairs in 1954. The United States, with an annual consumption of leather footwear in excess of three pairs per capita, accounted for 40% of the world shoe production in 1954.

(E. G. AN.)

Shooting. Logan Bennett of Hodgenville, Ky., who never before had won a trapshooting title, captured the men's prize in the 56th Grand American handicap competition at Vandalia, O., in Aug. 1955. A field of 2,024 competed, the largest ever assembled for the event. Bennett broke 99 of 100 targets from 19 yd. U. B. Sellers, of Okolona, Ky., with 98x100 from 21 yd., tied for second with Bruce Doughman of Brookville, O. Firing from 20 yd., Mrs. Dolly Isetts of Kenosha, Wis. scored 93x100 for women's honours, while R. L. Schwiager of Grand Island, Neb., with 95x100 from 21 yd. was junior king. George Heaney of Indianapolis, Ind., broke 94 from the 24-yd line to lead the professionals. Among other major winners were the following:

Preliminary Handicap

Men—F. B. Rees, Heyworth, Ill.
 Women—Mae Ramey, Miamisburg, O.

National Doubles

Men—Hugh McKinley, Harrisburg, O.
 Women—Helen Thomas, Los Angeles, Calif.
 Professional—Homer Clark, Jr., Alton, Ill.

North American Clay Target

Men—Ned Lilly, Stanton, Mich.
 Women—Helen Thomas

High Over-all

Men—Ned Lilly
 Women—Joan Pfeuger, Miami, Fla.
 Professional—Cliff Doughman, Morrow, O.
 Junior—Larry Gravestock, Amarillo, Tex.

All-Around

Men—A. M. Feltus, Washington, Miss.
 Women—Joan Pfeuger
 Professional—Cliff Doughman
 Junior—Bill Morris, Jr., Russell, Kan.

National Veterans

Men—Homer Clark, Sr., Alton, Ill.
 Women—Mrs. Van M. Marker, Versailles, O.

National Amateur Trapshooting.—George Van Wyck of Nyack, N.Y., scored 196x200 to win the singles in the 46th annual championships, held on the New York Athletic club range at Pelham Manor, N.Y. Mrs. Karl Jonas of Philadelphia, Pa., took the women's singles, J. J. McHale, Sr., of Hamilton, Ont., the men's senior and Nick Egan of Flushing, N.Y., was junior champion. M. D. Clark, Woodbury, Conn., with 93x100, retained the doubles honours. Van Wyck also took the non-championship preliminary handicap with a 94. Elbert Johnson, Wingdale, N.Y., tallied 93x100 from 22 yd. for handicap honours and Bob Smith, Taneytown, Md., captured the over-all prize with a total of 365.

National Skeet Championships.—The U.S. title meet at Waterford, Mich., saw eight new records established. The most outstanding score was the world five-man team mark of 1241x-1250 set by the California marksmen Alex Kerr, Beverly Hills; William Hay Rogers, Atherton; George A. Young, Camp Pendleton; Jack Horner, San Francisco, and Andy Laird, Stockton. Kerr, who had captured more national crowns than any skeet competitor, also took the all-gauge and small-gauge events and teamed with Laird to win the small-gauge two-man contest. Jack Lovett, Jr., Montgomery, Ala., won high over-all for the third straight year. In the women's events, Mrs. Alphonso Ragland, Jr., of Dallas, Tex., won the all-around, small-gauge and sub small-gauge and Mrs. Leon Mandel of Chicago, Ill., took the all-gauge and 20-gauge shoots.

European Championships.—At Cairo, Egypt, Douglas Palmer of the United States defeated Aly Riad, Egypt, in a shoot-off for men's individual honours and helped the U.S. win team skeet laurels. Mrs. Dolly Isetts gained the women's crown. Mrs. Isetts also led rivals from four countries in the clay target championship test, the men's award going to Egypt's S. Ghaleb.

Rifle and Pistol Shooting.—The U.S. tournament was held at Camp Perry, O., in August and a 43-year-old woman, Mrs. Viola Pollum, furnished the meet's big surprise by winning the small-bore rifle title. Competing against 500 of the nation's best .22 caliber marksmen, the Brookville (Pa.) gunner scored 6,390 out of a possible 6,400. She accounted for 630 bullseyes and her other shots were 9's. Among other major champions were the following:

National Outdoor Rifle

High-power (NRA match rifle)—Pfc. L. G. Crow, U.S. army
 High-power (M-1 service rifle)—Capt. J. W. Kolb, U.S. army
 Women's high-power (NRA)—Marlene Bellinger, Seattle, Wash.
 Women's high-power (M-1)—Ruth Sawyer, Dayton, O.
 Civilian high-power (M-1)—Paul Sullivan, Washington, D.C.
 Civilian high-power (NRA)—Ammon Bell, Hummelstown, Pa.
 Junior small-bore—W. J. Grater, Oxnard, Calif.
 Junior high-power (NRA)—G. M. Van Orden, Triangle, Va.
 Junior high-power (M-1)—W. Johnson, Warwick, Va.

National Trophy Matches

Individual—Lieut. C. A. Folsom, U.S. army
 Team—U.S. marine corps (H. J. Witkowski, E. L. Hayes, F. A. Wigmore, G. L. Armitage, C. D. Castaneda, S. H. Kamrau)

Indoor Small-bore Rifle

Men—V. F. Wright, Fort Wayne, Ind.
 Women—Ruth Sawyer
 Junior—Richard Grymes, Washington, D.C.
 Team—Minneapolis Rifle club (H. Woltman, E. D. Swanson, R. K. Sandager, O. C. Helseth)
 Intercollegiate—Leonard Puccinelli, California
 Intercollegiate team—California (John Ward, F. X. Clasby, Tao-Yuan Wu, James Carter, Charles Quesnoy)

National Pistol

Men's outdoor—M/Sgt. Huelet Benner, U.S. army
 Women's outdoor—Mrs. Gertrude Backstrom, Hoquiam, Wash.
 Men's indoor—C. E. Hery, Everett, Mass.
 Women's indoor—Mrs. Backstrom

(T. V. H.)

Shopping Centres: see BUILDING AND CONSTRUCTION INDUSTRY.

Shows. This article covers horse and dog shows, livestock exhibitions and such travelling shows as circuses, carnivals, ice skating revues and rodeos. For musical and dramatic events of 1955. see the articles DANCE; MOTION PICTURES; MUSIC; and THEATRE. (See also FAIRS AND EXHIBITIONS.)

Horse Shows.—The largest and longest established of the horse shows in the United States are those of the International Live Stock exposition, which in 1955 was held in Chicago, Ill., Nov. 25–Dec. 3 in the International amphitheatre, and the American Royal, held in Kansas City, Mo., Oct. 15–22. Both were regarded as outstanding events in the quality and number of gaited horses, harness horses and ponies, and hunters and jumpers.

Quarter horses, a rapidly gaining breed in all parts of the country, were emphasized at the National Western Stock show in Denver, Colo., Jan. 14–22, at the Southwestern Exposition and Fat Stock show in Fort Worth, Tex., Jan. 28–Feb. 6, and at the International Dairy show in Chicago, Oct. 8–15.

The Kentucky State fair, Sept. 9–17, at Louisville, was one of the year's leading saddle horse shows; and large competitions of hunters were featured at the National Horse show, Nov. 1–8, in Madison Square Garden in New York city and at the Royal Agricultural Winter fair, Nov. 11–19, in Toronto, Ont.

Other prominent horse shows of the year were featured at the Harrisburg, Pa., show; the Devon Horse show, Devon, Pa.; and those held in conjunction with the Illinois, Indiana, Kentucky, Minnesota, Missouri, Ohio and Wisconsin state fairs.

Livestock Shows.—The National Western Stock show in Denver, Jan. 14–22, was the first of the country's annual livestock shows. It featured the nation's largest display of purebred Hereford cattle and quarter horses, and also was the setting of the largest annual Hereford auction sale.

Shortly following the Denver show was the Southwestern Exposition and Fat Stock show at Ft. Worth. It was held in the Will Rogers Memorial auditorium, one of the country's largest and most modern livestock show buildings, Jan. 28–Feb. 6. The Fort Worth show was distinguished by a large competitive exhibition of purebred Brahman cattle, a breed gaining rapidly in popularity for crossing purposes with the English beef breeds. At Fort Worth also was held the major showing of the English beef breeds—Aberdeen-Angus, Herefords and Shorthorns. This was the country's oldest livestock show.

Following Fort Worth was the Houston (Tex.) Fat Stock show, Feb. 2–13, another major exhibition of the beef breeds as well as Brahmans. Both shows featured championship rodeos as daily entertainment.

Big livestock competitions were featured at the leading state fairs, starting in August. With the exception of the New York and Texas state fairs, the largest were in the midwest. They were preceded by county fairs during July and August. Winners of county shows usually go on for further competition at the state fairs.

GRAND CHAMPION of the 1955 Westminster Kennel club show, New York city, Kippax Fearnought, bulldog, shown with the nonsporting group trophy he won Feb. 15 on his way to the best-in-show honours

State fairs continued in consecutive weeks in circuits through the eastern, midwestern and western states. Among those with the largest livestock exhibitions in 1955 were the Illinois, Indiana, Ohio, Iowa, Missouri, Minnesota and Wisconsin state fairs.

Largest in point of attendance each year is the Texas state fair at Dallas, which in 1955 was held Oct. 7-23. It featured a Pan-American exposition attracting many Latin-American visitors.

Highlighting the dairy breeds was the National Dairy Cattle congress at Waterloo, Ia., Oct. 1-8, and in the following week was the 3rd annual International Dairy show at the International amphitheatre in Chicago. The latter event attracted the year's largest showing of several of the dairy breeds and included the national show of the Jersey breed. There was considerable Canadian participation.

Earliest of a series of livestock exhibitions, which follow after the state fairs, was the Eastern States exposition, in Springfield, Mass., Sept. 17-25. Emphasis at this event is usually on the exhibition of dairy cattle from the east.

Another large show of this class, featuring the beef breeds, was the Ak-Sar-Ben Livestock and Horse show in Omaha, Neb. It was held Sept. 23-Oct. 2. Also in October were the Grand National Live Stock exposition in San Francisco's Cow Palace, Oct. 28-Nov. 7, and the Pacific International at Portland, Ore., Oct. 15-22.

A more recently established eastern show of growing importance was the Eastern National Live Stock show at Timonium, Md., which was held Nov. 12-18. It emphasized competitive exhibitions of purebred Aberdeen-Angus and Hereford cattle.

The American Royal Livestock show was held in Kansas City, Oct. 15-22. It is one of the country's longest established major livestock events. It ranks as a major exhibition of the beef breeds and its horse show is among the nation's best.

The show year was brought to a close with the International Live Stock Exposition and Horse Show at Chicago, which exceeded all the other shows of the year in number of livestock entries. The 56th annual show was held Nov. 25-Dec. 3.

The Chicago Stock Yards was the setting of the largest feeder cattle shows and sales in 1955, where three separate events, held Sept. 22-23, Oct. 13-14, and Oct. 27-28, drew a combined entry of 579 carloads (20 head to a car) of western produced calves, yearlings and 2-year-olds. These were sold at auction to corn-belt and eastern feeders to convert into finished fat cattle for the 1956 markets.

The two principal livestock exhibitions of Canada are the Royal Agricultural Winter fair, held in 1955 during Nov. 11-19, and the Canadian National exhibition, held Aug. 26-Sept. 10, both in Toronto. The winter fair is among the world's leading exhibitions of purebred livestock and farm products.

The oldest established stock show in the world is the Highland show in Scotland. It celebrated its 116th anniversary in June, followed by the British Royal show in early July, in its 107th show under sponsorship of the English Royal Agricultural society.

(W. E. O.)

Dog Shows.—Formal dog shows and field trials continued their popularity and growth in 1955, along with the continuing popularity of the dog in general. Shows for all breeds numbered 401, against 386 in the previous record year of 1954. The specialty, or one-breed shows, again reached a new high, numbering 326 against 304 in 1954. This gave a total of 727 championship or point shows. In addition there were approximately 465 informal or sanctioned shows, also termed match shows but with no championship status.

The largest show was the New York city show of the Westminster Kennel club on Feb. 14-15 with 2,035 dogs competing. The top award was won by the California bulldog entry Champion Kippax Fearnought, owned by John A. Saylor.

An outstanding show event of 1955 was the continuation of the wins of best-in-show at all-breeds shows by the fawn boxer Bang Away of Sirrah Crest. His victories now totalled 121, a new world record in any breed.

Field trials with competition on actual game or under simulated hunting conditions showed the following winners:

In bird dogs the national championship was run at Grand Junction, Tenn., and was won by the pointer male Lone Survivor, owned by E. R. Calame of Jonesboro, Ark. The Weimaraner national champion in the field at Highland, Mich., was won by Gerri v Fabien, owned by Mrs. Adelaide L. Frazer, Eugene, Ore. The German Shorthaired Pointer national championship was won by Dixon's Sheila, owned by Russell V. Dixon of New Haven, Mich. The trial was held at Killdeer Plains, O. The National Irish Setter championship was run at Dover, Del., and was won by R. C. Baynard Jr.'s Double Jay, a male. The All-America Quail championship, run at Crab Orchard Wildlife Refuge, Carbondale, Ill., was won by H. E. Longsdorf's pointer male Warhoop Jake. The Cocker Spaniel national championship stake, held at Ringoes, N.J., was won by the English Cocker Spaniel male Greatford Meadowcourt Pin, owned by Albert F. Winslow, Goshen, N.Y. The English Springer Spaniel national championship stake, held at Crab Orchard Wildlife Refuge, Carbondale, Ill., was won by the male Ludlovian Bruce of Greenfair, owned by Mr. and Mrs. Jos. C. Quirk, Greenwich, Conn. (this dog also won the title in 1954). The National Retriever championship stake, held near Sacramento, Calif., was won by the black Labrador male Cork of Oakwood Lane, owned by

Harold Mork of Anoka, Minn.

In stud book registrations, which are regarded as an indication of tendencies in breed popularity, the beagle was first in 1955, by a wide margin. The next nine in order were: boxer, cocker spaniel, chihuahua, dachshund, German shepherd dog, collie, poodle, Boston terrier and pekingese. (W. Ju.)

Circuses, Carnivals, Rodeos and Other Travelling Shows.

—In contrast to most other outdoor entertainment, circuses and carnivals did not fare as well as usual in 1955, the season being spotty. Economic conditions were favourable, yet most shows failed to make a profit. Circuses were hampered by a constant turnover of working forces, principally resulting from the notoriously low pay and poor living conditions, coupled with poorly presented shows, lack of advertising and the public's consequent lack of interest. The larger sponsored shows, playing mostly indoors, were least affected and had an excellent season. Such outfits as Hamid-Morton, Polack Bros., Tom Packs, Orrin Davenport and Gil Gray, usually sponsored by some prominent organization, presented shows superior to most of the tented outfits, and with well-paid personnel and high-powered promotion drew excellent business. Smaller shows employing telephone crews to sell tickets found it increasingly difficult to play return dates because of the methods employed.

The Clyde Beatty circus, playing the western half of the country, found the going rough and closed several weeks earlier than usual. The Ward-Bell combination, in its first season, played the western country, Alaska and parts of Canada, to only fair results. King Bros., Mills Bros., Hunt Bros. and Al G. Kelly-Miller Bros., leading truck shows, all found business spotty and below that of 1954. Ringling Bros.-Barnum & Bailey, the only large circus on the road, was plagued with troubles during the entire season. Its first two stands were big, the Madison Square Garden, N.Y., engagement grossing more than \$2,000,000, and a week in Boston, Mass., more than \$250,000. But a change in advertising policy which discontinued most of the billboard advertising that had always been a mainstay for attracting attendance proved disastrous. Changes in key personnel caused dissension and union trouble added to the show's worries. Over most of the country business was unsatisfactory. There also was doubt as the season closed as to whether the Madison Square Garden contract would be renewed for 1956.

Reports from Europe indicated that the circuses, most of them small truck outfits, did very well in 1955. However, the Bertram Mills show, largest in England, reported profits down compared with 1954. Latin-American circuses had a fairly good season.

Bad weather plagued the early season stands of carnivals in the United States, and continuing restrictions on chance games cut their income. The larger shows recouped early season losses with good business at the state affairs, but most of them closed with grosses considerably less than in 1954.

There was little change in the rodeo setup. The events, staged mostly at western fairs, remained popular. The World's Championship rodeo at Madison Square Garden, and the International rodeo at International stadium, Chicago, Ill., both drew large attendances, mainly because of their star "names," Roy Rogers and Gene Autry, respectively.

Stock car auto racing and automobile thrill shows continued their popularity, drawing excellent business both at fairs and "still" dates. One thrill show outfit made a trip to Europe, the first to play on the continent, and was tremendously successful. The increase in number of ice skating shows had an unfavourable effect on business, but several of the long established outfits had a profitable season.

The popularity of "hillbilly" shows on several radio and television stations led to the launching of several road companies

featuring rural and western music. Stations WSM, Nashville, Tenn.; WLS, Chicago, and WLW, Cincinnati, O., furnished talent for the shows, which in many spots did turnaway business. Several attempts were made to revive the once popular repertoire shows under canvas, but with little success. An attraction which found favour since its introduction in 1954 was "Dancing Waters," a water spectacle using gorgeous electrical effects. A number of units toured the country with satisfactory results.

The effects of television on outdoor show business were plainly evident. Circuses and other travelling shows were engaging show business personalities who had been publicized on television and found that the practice resulted in a marked increase in attendance. Each year the "little fellow" was finding it more difficult to compete with show interests that could invest large sums in promotion and publicity and could experiment until the show was shaped to hit the popular chord. (NA. G.)

Siam: see THAILAND.

Sierra Leone: see BRITISH WEST AFRICA.

Sikkim. An Indian-protected state, Sikkim is bounded north by Tibet, east by Bhutan, south by India and west by Nepal. Area: 2,744 sq.mi. Pop. (1951 census): 135,725, mostly Nepalese (Gurkha) but including Bhotias of Tibetan extraction (about 9%) and Lepchas or Rongpa (about 10%) of Indo-chinese origin. State religion: lamaistic Buddhism, but most of the Nepalese are Hindu. Capital, Gangtok. Maharaja, Tashi Namgyal. Dewan (chief minister) in 1955, J. S. Lall.

History.—Unofficial reports revealed in 1955 that Chinese communists, firmly established in Tibet, started propaganda for a free "Gurkhanstan" to include Sikkim, Nepal, Bhutan and the Darjeeling districts of India.

Finance.—Budget (1951 est.): balanced at Rs. 2,100,000 including the fixed annual subsidy of Rs. 300,000 from India. Monetary unit—Indian rupee, valued in 1955 at 21 U.S. cents.

Silk. The production and consumption of silk in most countries of record in the world continued in 1955 the upward trend noticed in 1954.

Outstanding developments in the United States, the second largest silk consumer, were the continued substantial use of douppioni, both raw and spun, for textured effects in all-silk and mixed fabrics, the swing to deniers coarser than 20/22 and the employment of silk as a decorative additive to wool, cotton and synthetic materials for improved hand and drape and for crossdye effects.

At the annual International Silk congress in Brussels, Belg., in May, closer co-operation among nations in the promotional program for popularizing silk was promised, further research was agreed upon to improve the quality especially for yarn-dyed fabrics, and the raw silk classification proposed by Japan was adopted. Japan's price stabilization law continued the previous year's minimum of 190,000 yen (about \$4.10 per pound) and the maximum of 230,000 yen (about \$4.95 per pound), but an amendment permitted creation of a nongovernmental organization to buy at a "cushion" level of about \$4.30. Prices in New York ranged for 2A 20/22 warp stock from \$4.80 to \$4.40, and for 200/250 douppioni from \$4.40 to \$3.50 per pound.

In Japan, the largest producer and consumer, the cocoon crop was the most abundant since World War II, and exports of raw

World Use of Silk in Major Consuming Countries*

(World use in bales of 132 lb. each, some European consumption unreported)

Year	Japan	U.S.	France	Italy	Switzerland	Great Britain
1955	186,500	51,792	17,727	18,530	2,553	2,848
1954	180,197	48,546	12,030	16,970	6,054	4,803
1953	189,325	41,171	15,550	13,348	6,098	5,075

*Exports and consumption estimated on nine months' figures.

silk and douppioni were the greatest since 1950. Japan's shipments of silk and silk-mixed fabrics were 150% of 1954, and its exports of silk waste were 234% of 1954. A small quantity of douppioni from Italy and South Korea was used in the U.S. Silk from the mainland of China, formerly the second largest producer, had been prohibited from entering the U.S. since 1951, but an unknown quantity found a market in Europe and Asia. Pongee fabrics incorporating tussah silk were prohibited by the U.S. government from entering the country. Tariff cuts negotiated at Geneva reduced U.S. import duties from 35% to 17½% on some types of silk waste and slightly on silk fabrics. (See also TEXTILE INDUSTRY.) (D. D. LD.)

Silver. Six countries mine most of the silver produced in the world, as shown in Table I, based on U.S. bureau of mines reports.

United States.—Although it was still second in world output of silver, the decline of the past five years in U.S. production persisted in 1954. The 3% decline in mine production of recoverable silver occurred in California, Montana, Nevada, New Mexico, Utah and Washington. Idaho's output rose in 1954. Data in Table II are based on U.S. bureau of mines reports. Output of silver in the first eight months of 1955 totalled 24,615,581 oz., a lower rate than in 1954—the effect of strikes at several base-metal mines.

Table II.—Silver Industry in the United States

(in 000 fine ounces or of dollars)

	1954	1953	1951	1950	1949

Canada.—Output of silver of all forms totalled 13,382,036 oz. in the first half of 1955.

Mexico.—This country, the world's leading silver producer, had an output of 829,380 kilos (metal content) in the first half of 1955. (F. E. H.; B. B. M.)

Singapore. Singapore is a British island colony off the southern end of the Malay peninsula, with Christmas Island dependency in the Indian ocean. Area: Singapore and adjacent islets 224.5 sq.mi.; Christmas Island 62 sq.mi. Pop.: Singapore Island (1947 census) 938,144; (1954 est.) 1,165,129, including 76% Chinese, 12% Malays, 8% Indians. Christmas Island (1947 census) 866; (1954 est.) 1,929. Capital, Singapore city, pop. (1954), 830,615. Governors in 1955: Sir John Nicoll and (from June 30) Sir Robert Black. Chief minister (from April 6, 1955), David Marshall. Singapore is chief port for Malaya.

The U.K. commissioner-general in southeast Asia, with responsibility for the co-ordination of policy in Malaya, Singapore, Sarawak, North Borneo and Brunei, has his headquarters

in Singapore. Commissioners-general in 1955: Malcolm MacDonald and (from September) Sir Robert Scott.

History.—The outstanding event of 1955 was the inauguration of the new constitution, providing for a legislative assembly of 32 members, presided over by a speaker and including 25 members elected by the secret ballot of all resident British subjects over 21 (300,199 in number), 4 unofficial members nominated by the governor and 3 official members. A council of ministers of 6 unofficial and 3 official members presided over by the governor was collectively responsible to the assembly. The governor's reserved powers included foreign affairs, defense and internal security. A coalition government of Labour Front and the Malay-Chinese alliance was formed with David Marshall, Labour Front leader, as chief minister. With 2 nominated seats allotted on his recommendation, the government had 18 votes against a party-splintered opposition of 14.

Its first months were stormy. Arising out of a strike in a Chinese-owned bus company, there was serious rioting on May 12 in which strikers and students of Chinese schools took part and during which four were killed, including two policemen and a U.S. journalist. The two largest Chinese schools were closed and the curfew reimposed.

The government passed a revised labour code, providing for a 44-hour week; set up commissions on the Malayization of the civil service, on local government, on Chinese education, on a minimum standard of living and on social security legislation; and appointed Sir Sydney Caine, vice-chancellor of the University of Malaya, as economic adviser. In November, the \$231,000,000 budget was passed by 19 votes to 13 in spite of secession of two Labour Front members.

On Aug. 20 the colonial secretary opened Singapore's new \$37,000,000 international airport with its 8,000-ft. runway.

(G. G. TN.)

Education.—(1954) Registered schools (government maintained, aided and private) 563, teachers 6,307. Pupils: primary 156,762; secondary 21,196 (including 2 junior technical schools, pupils 356, teachers 34). One government teachers' training college and several centres and courses; teachers in training 1,723. University of Malaya (Oct. 1954): students 1,043, teaching staff 161.

Finance.—Monetary unit: Malayan dollar, equal to 2s. 4d. sterling and valued in 1955 at 32.66 U.S. cents. Budget (1955 revised est.; 1956 est. in parentheses): revenue M\$201,000,000 (M\$208,400,000); expenditure M\$198,800,000 (M\$231,150,000). Foreign trade (1954): imports M\$2,330,100,000; exports M\$2,054,300,000 (excluding trade with the Federation of Malaya, totalling M\$1,099,000,000). Main source of imports: Indonesia 34.1%; U.K. and commonwealth 22.7%; main destination of exports: Europe 19%; U.K. and commonwealth 28.5%. Main exports: rubber (including transshipment) 38.2% (555,295 tons); tin 9.6% (33,276 tons); motor spirit 11.9%.

Shipping.—(1954) Vessels entered 19,739 (including 6,188 foreign trade ships of more than 75 tons); total tonnage 49,100,000 net; cargo handled (1954) 5,400,000 metric tons loaded; 9,324,000 metric tons unloaded.

Skating: see ICE SKATING.

Skiing. Olympic tests added colour to a heavy competitive program in the United States during the winter of 1954-55. Combined with a number of national and international events, trials were held at Franconia and North Conway, N.H., Stowe, Vt., and Ishpeming, Mich. Ensign Tom Corcoran, U.S. navy, won the giant slalom tryout that opened a three-day meet at Franconia on March 11. On the second day Chiharu Igaya, Japanese student at Dartmouth college, Hanover, N.H., tied Bill Beck of the U.S. army for the national downhill title, the leaders being caught in identical times of 1 min. 55.3 sec. Sixty-five competitors from the U.S. and Canada saw action on the third day when Ralph Miller, U.S. army, won the slalom. A little less than 2 sec. behind was Brooks Dodge of the army. Igaya, who placed third in the slalom, retained national combined honours.

The scene shifted to Stowe on March 18 for international.

AIR-BORNE TROLLEY CAR placed in operation on ski slopes at St. Moritz, Switz., in 1955

national and Olympic trial races. Andreas Molterer of Austria carried off the slalom prize for men as Mrs. Andrea Mead Lawrence of Parshall, Colo., led the women. The same two topped their respective groups in the international giant slalom. Wallace (Bud) Werner, 19-year-old Denver (Colo.) university freshman, grabbed the spotlight on March 20 when he captured the American international downhill in 2 min. 07.5 sec. to better the Stowe course record of 2 min. 16.7 sec. set by Ernie McCulloch, Canada, two years before.

Mrs. Lawrence, skiing for the Aspen (Colo.) Ski club, just missed a sweep of titles when she was tied by Madeleine Berthold of Switzerland at 2 min. 08.7 sec. in the downhill test for women. However, she did take combined honours. Dorothy Modenese, Seattle, Wash., had a bad fall, suffering a fractured pelvis and two broken ribs. Named to the U.S. Olympic team were Brooks Dodge; Tom Corcoran; Bud Werner; Ralph Miller; Marvin Moriarty, Stowe; Marvin Melville, Salt Lake City, Utah; Les Streeter, Northfield, Vt.; Dick Mitchell, U.S. air force. Bill Beck and Ken Lloyd, Reno, Nev., were picked as alternates. Chosen for the women's squad were Mrs. Lawrence; Katy Rodolph, Reno; Gladys (Skeeter) Werner, Steamboat Springs, Colo.; Dorothy Modenese; Betsy Snite, Norwich, Vt. The two alternates were Penny Pitou, Gilford, N.H., and Jeanette Burr Bray, Seattle, Wash.

Jumping trials were held at Iron Mountain, Mich., and Rudy Maki, 19-year-old youth from nearby Ishpeming, dominated the meet. On Feb. 25 Maki made the longest jump ever recorded east of the Rockies when he soared 300 ft. Two other young athletes, Dick Rahoi, 19, of Iron Mountain and Roger Ulland, 17, of Seattle, were chosen for the Olympic team along with Roy Sherwood, Salisbury, Conn.; Art Devlin, Lake Placid, N.Y.; and Billy Olson. Alternates were Coy Hill, Ishpeming, and Len Johnson, Duluth, Minn. Maki's performances gave him the central U.S. championship to add to the national laurels he won earlier in February.

Denver won the national intercollegiate championship as well as the Rocky Mountains team title. Middlebury was Eastern team champion.

Among the major champions of 1955 were the following:

United States

Jumping—Rudy Maki, Ishpeming, Mich.
Downhill—Chiharu Igaya, Hanover, N.H., and Bill Beck, Mount Mansfield, Vt., tied
Slalom—Ralph Miller, U.S. army
18-km. cross-country—Tauno Pulkkinen, Finnish Ski club, New York city
30-km. cross-country—Tauno Pulkkinen
Alpine combined—Chiharu Igaya
Giant slalom—Ralph Miller
Women's giant slalom—Jeannette Burr Bray, Seattle, Wash.
Women's downhill—Mrs. Andrea Mead Lawrence, Parshall, Colo.
Women's slalom—Mrs. Lawrence
Women's alpine combined—Mrs. Lawrence
Veterans' giant slalom—Fred Pinkham, Glendale, Calif.
Women veterans' giant slalom—Edna Dercum, Dillon, Colo.
Junior girls' slalom—Penny Pitou, Gilford, N.H.
Junior boys' slalom—Frank Brown, McCall, Ida.

North American

Jumping—Ansten Samuelstuen, Steamboat Springs, Colo.
Downhill—Ralph Miller and Bill Beck, tied
Slalom—Ralph Miller
Alpine combined—Ralph Miller
Cross-country—Sven Johansson, Anchorage, Alsk.
Women's downhill—Cathy Carey, Denver
Women's slalom—Skeeter Werner, Steamboat Springs
Women's Alpine combined—Skeeter Werner

Canadian

Slalom—Art Tommy, Ottawa, Ont.
Women's slalom—Monique Langlois, Quebec City, Que.
Downhill—Ralph Miller
Women's downhill—Carlyn Kruger, Montreal, Que.

U.S. Intercollegiate

Jumping—Bill Olson, Denver
Downhill—Chiharu Igaya, Dartmouth
Slalom—Chiharu Igaya
Cross-country—Larry Damon, Vermont
Nordic combined—Erik Berggren, Idaho
Alpine combined—Chiharu Igaya
Jumping team—Middlebury
Downhill team—Dartmouth
Slalom team—Dartmouth
Cross-country team—Denver
Alpine combined team—Dartmouth
Nordic combined team—Denver
Over-all team—Denver

Smithsonian Institution. This institution located on the Mall in Washington, D.C., was established in 1846 through a bequest from James Smithson, an English scientist. It is governed by a board of regents, composed of the vice-president of the United States, the chief justice of the United States, three senators, three representatives and six citizens from various parts of the country. The executive officer is the secretary, who in 1955 was Leonard Carmichael. The institution has ten branches: United States National museum, Bureau of American Ethnology, Astrophysical observatory, National Collection of Fine Arts, Freer Gallery of Art, National Air museum, National Zoological park, Canal Zone Biological area, International Exchange service and the National Gallery of Art (with separate board of trustees).

The most important event of the year 1955 was the authorization by congress of a \$35,000,000 Museum of History and Technology of the Smithsonian, to be erected on Washington's Mall area and to house all the national collections that record and illustrate the political, cultural, industrial and military development of the United States. Congress appropriated \$2,288,000 for the immediate planning of this new museum.

During 1955 the institution continued its scientific investigations, chiefly in the fields of anthropology, astrophysics, biology

PRES. AND MRS. EISENHOWER at an exhibit of First Ladies' gowns opened at the Smithsonian exhibition in May 1955. The gown on the left is the one worn by Mrs. Eisenhower at her wedding to the president July 1, 1916

and geology. Several field expeditions were in progress in the interests of these researches, resulting in much new information and in large collections of valuable specimens.

The National museum collections were increased by approximately 7,600,000 specimens, bringing the total catalogue entries to 42,864,645. In the museum's program of exhibit modernization two new halls were formally opened to the public—a hall exhibiting the gowns of the first ladies of the White House in period settings and the American Indian hall.

The National Gallery of Art received 842 accessions. It held six special exhibitions. The National Collection of Fine Arts sponsored 14 special exhibitions and the Smithsonian Traveling Exhibition service circulated 68 exhibitions, 57 in the United States and 11 abroad. The Freer Gallery of Art acquired many choice specimens of Chinese, Persian, Japanese, Indian, Iraqi and Turkish art and decoration.

Anthropologists on the staff of the Bureau of American Ethnology continued their researches, particularly on Panamanian and Mexican archaeology and arctic anthropology. The River Basin surveys, a unit of the bureau, continued its archaeological work at sites threatened by dam and reservoir construction, particularly in the Missouri valley.

Solar radiation studies of the Astrophysical observatory were continued at the observatory's two high-altitude stations—Montezuma in northern Chile and Table mountain in southern California. In its division of radiation and organisms, studies were made on the photocontrol of the processes of plant growth and on the mechanism of action of the plant hormone auxin in the control of growth. Effective July 1, Fred L. Whipple, of Harvard university, was appointed director of the Astrophysical observatory, succeeding L. B. Aldrich, retired after 46 years with the institution. At the same time, headquarters of the observatory were changed to Cambridge, Mass.

The National Air museum completed the moving of its stored materials from Park Ridge, Ill., to Suitland, Md. Included in the year's 117 added specimens for the museum's aeronautical collections was the midget racing plane "Buster," built in 1931 and flown in more than 50 races.

The Langley gold medal, established in 1908 for "specially meritorious investigations in connection with the science of aerodromics and its application to aviation," was awarded by the institution on April 14 to Jerome C. Hunsaker.

The collection of animals in the National Zoological park numbered 3,410. Noteworthy among the year's accessions were

a pair of baby gorillas, several young chimpanzees and two Goeldi's marmosets; emperor, Adelie and Humboldt penguins; two rare Mona Island iguanas and a horn-nosed iguana; and a domestic donkey. In all, 280 creatures were born or hatched at the zoo during the year.

The International Exchange service handled 1,146,972 packages (weighing about 813,000 lb.) of scientific and governmental publications, serving as the United States agency for the interchange of such material with other countries.

At the Canal Zone Biological area, Barro Colorado Island Panamá, more than 600 visitors were recorded, 43 of whom were scientists using the station's facilities to further their researches, particularly in biology and photography.

Outstanding among the institution's publications during the year were the following: "The Material Culture of Pueblo Bonito," by Neil M. Judd; "The Black Flies of Guatemala and Their Role as Vectors of Onchocerciasis," by Herbert T. Dalmat; "Checklist of North American Recent Mammals," by Gerrit S. Miller, Jr., and Remington Kellogg; "Frogs of South-eastern Brazil," by Doris M. Cochran; "The Horse in Blackfoot Indian Culture," by John C. Ewers; "A Ceramic Study of Virginia Archeology," by Clifford Evans; "Masters of the Air," by Glenn O. Blough; volume 7 of the *Annals of the Astrophysical Observatory*; and volume 1 of the new series "Ars Orientalis." The Smithsonian library, including its various branches, numbered in 1955 approximately 951,400 volumes.

The year's recorded visitors to the Smithsonian buildings reached a total of 8,186,533, including the main Smithsonian building, the Natural History building, the Arts and Industries building, the Aircraft building, the Freer Gallery of Art, the National Gallery of Art and the National Zoological park.

(L. CAR.)

Smog: see LOS ANGELES.

Soaring: see GLIDING.

Soccer. The Eintracht 11 of Astoria, N.Y., won the top U.S. prize in the sport in 1955 when it set back the Los Angeles (Calif.) Danes, 2-0, at Los Angeles to gain United States open laurels. In advancing to the Challenge cup final, Eintracht eliminated the Philadelphia (Pa.) Uhris in the eastern play-offs while Los Angeles was subduing the Simpkins team of St. Louis, Mo., in the concluding western division contests. The national amateur cup was captured by the Heidelberg Tornados of Pittsburgh, Pa., when they turned back the Chicago (Ill.) Eagles in the ultimate play-offs. The Uhris gained the American league championships and went on to win top honours in the long competition for the Lewis cup. The Philadelphians downed Brookhattan-Galicia of New York, five goals to three in the final two-game series for the Lewis award. The New York Lithuanians won the New York state cup; the German-Hungarians of New York triumphed in the German-American league and New York's Ukrainians led the National league. The Maritimo 11 of Newark carried off the New Jersey state league title.

The U.S. season was brightened by the visits of a number of teams from other countries, including the Nuremberg team of Germany which twice attracted more than 15,000 spectators for contests in New York. The records of the touring teams are shown in the table.

Records of Various Soccer Clubs While Visiting the U.S., 1955

Clubs	Games	Won	Lost	Tied
Sunderland, England	9	5	0	4
Huddersfield, England	9	5	1	3
Nuremberg, Germany	7	5	1	1
Wacker, Austria	1	1	0	0
Sochaux, France	2	2	0	0
Grasshoppers, Switzerland	3	3	0	0
Occidente, Mexico	3	2	0	1

(T. V. H.)

Socialism. Socialists during 1955 served as prime ministers in the governments of Belgium, Denmark, the Netherlands, Norway and Sweden in Europe, of Israel in the middle east and of Burma in Asia. In India the Congress party, led by Prime Minister Jawaharlal Nehru, declared itself during the year in favour of a "socialistic pattern of society."

In the Americas, Socialists in 1955 were dominant forces in the governments of Jamaica in the West Indies, of Costa Rica in Latin America and of the province of Saskatchewan in Canada. The Socialist and Labour parties had likewise minority representation in the coalition cabinets of Austria, Italy and Switzerland; continued throughout most of the year with the largest parliamentary representation of any party in Finland and France; and were the chief opposition parties in Great Britain, Germany, Australia and New Zealand.

In all these countries Socialists were vigorously engaged during 1955 in the task of strengthening labour and social legislation and spearheading the fight against both conservatism and communism.

Great Britain and Commonwealth.—The British Labour party continued during the year as the leading party in the Socialist international. In the parliamentary elections of May 26, British Labour elected 277 members to the house of commons, 18 fewer than in 1951, and obtained 12,405,246 votes, a drop of 1,500,000, or 46.3% of the total as contrasted with 48.8% in 1951. On the other hand, the Conservative party returned to the house of commons 345 of its representatives, a gain of 24, with a popular vote of 13,336,182, a drop of 381,356 from the previous election.

In the October annual conference of the Labour party, Hugh Gaitskell was elected treasurer over Aneurin Bevan, leader of the left wing of the party. The delegates defeated a number of pro-Soviet and anti-U.S. resolutions. At the same time, they reaffirmed Labour's position in favour of the admission of Communist China to the United Nations and the withdrawal of Chiang Kai-shek from Formosa. They likewise voiced "strong disapproval" of South Africa's racial policy. (See also POLITICAL PARTIES, BRITISH.)

In Australia and New Zealand the Labour parties remained the chief opposition. The most publicized intraparty controversy during the year in Australia concerned itself with the influence within the party of "the movement," an anticommunist organization formed by Catholic Action within the trade unions which its opponents charged with trying to further Catholic domination over the Labour party and trade unions.

The Labour party of Victoria was defeated in the Victoria state election in its contest with a Liberal and Country party coalition. The election followed the defeat of Labour Premier John Cain on a vote of confidence on April 20 after Labour members of the state parliament had broken away to form a new, strongly anti-Communist party.

In India differences arose during the year within the Indian Praja-Socialist party as to what should be the party's relation with the Congress party headed by Prime Minister Jawaharlal Nehru. Nehru's party, in its January convention at Madras, favoured social planning in India "with a view to the establishment of a socialistic pattern of society in which the principal means of production are under social ownership or control, production is progressively speeded up, and there is equitable distribution of the national wealth." On the other hand, it declared that large sectors of industry should remain private.

In Singapore the Labour front, a socialist party, won 10 of the 25 elected seats in an assembly of 32 in the elections on April 2, and obtained 27% of the total vote. Support from the British governor and from various organizations gave to David Marshall, leader of the Labour front, a majority of one in the

assembly, and he formed the government of Singapore as its chief minister, with the declared intention of creating a social order "free from the exploitation of man by his fellowman" and dedicated to the establishment of a "democratic welfare state."

In Canada the Co-operative Commonwealth federation, that country's Socialist party, continued in control of the province of Saskatchewan under the premiership of T. C. Douglas, and had a representation of 24 in the dominion house of commons.

Scandinavian Countries.—Socialists during 1955 remained in control of the governments of Denmark, Norway and Sweden. In Norway the government established stricter controls over imports and capital investments with a view of creating a better balance between imports and exports. Sweden expanded its social welfare program to include general health insurance and began to plan for a system of general pension insurance which would give all income earners a pension at the age of 67.

On Sept. 15 the ministers of social affairs of the northern countries—Denmark, Finland, Iceland, Norway and Sweden—signed a Scandinavian convention under which citizens of any of the five countries who took up residence in any one of the others would be entitled to the same social benefits as the citizens of the second country. Old-age and other pensions would be provided to persons who had lived in the same country for five years.

Germany.—The German Social Democratic party, with a membership of 600,000 and a parliamentary representation of 151, remained during the year as the chief opposition to the government. In several local elections the party increased its votes over those received in the preceding elections. On Jan. 11 Otto Suhr, Socialist, became mayor of west Berlin after his party's victory in the house of deputies elections.

In the elections in Lower Saxony on April 24, Social Democrats polled 35.2% of the votes as against 30% in 1953. Together with its ally, the Refugee party, it won 76 members of the state parliament as against 74 for the Christian Democratic party and its allies. On Oct. 9 the Social Democrats obtained sweeping gains in elections in the city-state of Bremen, polling 47.8% of the popular vote and winning 52 of the 100 seats in the parliament against 43.2% of the votes and 44 seats in parliament for the opposition parties. In these campaigns, the Social Democrats opposed immediate rearmament of Germany out of fear that such rearmament would lead the U.S.S.R. to oppose reunification and strengthen nazi-minded forces in western Germany.

France.—In France the Socialist party, with the largest parliamentary representation in that country (103), remained throughout the year outside the coalition governments. In late February, following the fall of the Pierre Mendès-France cabinet, when Christian Pineau, Socialist, was asked to form a coalition cabinet, he submitted to the assembly a program of action which included the speedy ratification of the Paris accords for the armament of west Germany; internal autonomy in Tunisia; and end of terrorism in Morocco; the restoration of order in Algiers; and, at home, extensive measures to increase production and improve social conditions. He urged that the powers given to Mendès-France to effect economic reforms by decree be extended to him for three months. Pineau, however, was unable to obtain a majority of votes, and the premiership passed to other hands.

Belgium.—In Belgium the Liberal-Socialist coalition government, headed by the Socialist leader, Premier Paul Henri Spaak, was involved during the year in a vigorous controversy with the Catholic Church. In early 1955 the Catholic bishop, angered at the government's decision to reduce state subsidies to Catholic schools and to impose restrictions on the use of these funds,

launched a campaign against the Socialist movement.

Socialists declared that their aim was to restore a fair equilibrium between public and denominational education, while the Catholics' aim was church domination over the schools.

The Netherlands.—In the Netherlands the coalition Catholic-Socialist government, headed by Willem Drees, leader of the Dutch Labour party, gave much attention to the enactment and enforcement of anti-inflation measures. Differences over measures for rent rises and tax reduction led to a government crisis in mid-May. On Feb. 22 Catholic and non-Catholic members of the Labour party joined at the party conference in a demonstration of solidarity against the 1954 decree of the Roman Catholic bishops forbidding Catholics to join the Labour party, attend its meetings or read its literature.

Italy.—In Italy the democratic Socialist forces in 1955 remained weak in comparison with the Christian Democrats and the Left Socialists and Communists. In the coalition cabinet formed in July the Saragat Socialists obtained 4 posts out of 21. Giuseppe Saragat, the party leader, was reappointed vice-premier, remaining in that position throughout the year. Socialist trade unions during the year won many workers away from the Communist-controlled unions.

Israel.—The Mapai, the socialist party of Israel, remained the dominant force in the government of that country during 1955. David Ben-Gurion, former prime minister, returned to Premier Moshe Sharett's cabinet as minister of defense after an absence of more than a year.

In the July 26 parliamentary elections the Mapai received 32% of the vote, compared with 37% in the *knesset* (parliament) elections of 1951. Ben-Gurion later became prime minister in a coalition cabinet.

Japan.—In the elections of Feb. 27 the right-wing Social Democrats won 67 seats out of 467 in the lower house of the diet, a gain of 6, and the left-wing Social Democrats 89, a gain of 15. Combined, they thus became the second parliamentary force in the diet, the Democrats having won 185 seats. The two branches of the party merged in October. In local elections on April 24 Socialists improved their relative position in the prefectural assemblies, but they were still fourth in party strength.

United States.—In the United States the Socialist party functioned during 1955 largely as an educational movement, running candidates in only a few cities. Socialist educational work was also engaged in by the Social Democratic federation, the Union for Democratic Socialism, the Socialist Verband and other groups. Jasper McLevy, leader of the Connecticut Socialist party (unaffiliated with the national party) was elected in November mayor of Bridgeport, Conn., for his 12th term. Frank P. Zeidler, Socialist, continued as mayor of the city of Milwaukee, Wis.

Latin America.—Pres. José Figueres of Costa Rica, leader of the National Liberal party, a democratic socialist party, continued the second year of his presidency and introduced additional reform measures. In Argentina, following the demise of the Perón regime, a number of Socialist leaders accepted offices in the succeeding cabinets and assisted in wresting the labour movement from the control of the followers of Perón. In the presidential election in Brazil the Socialist party supported Gen. Juarez Tavora, who ran unsuccessfully on a platform of land reform and efficient, honest administration.

International.—The fourth congress of the Socialist international met during the year in Caxton hall, London, Eng., on July 12. It was attended by delegates and consultants from 30 countries in four continents and gave considerable time to the consideration of economic and social aid to undeveloped countries, to the relations between Israel and the Arab world and to the differences between the French Socialist and British Labour

viewpoints on the organization of Europe. The Asian Socialist conference continued to function among the Asian countries as an information and consultative centre with headquarters in Rangoon, Burma. (See also DEMOCRACY.) (H. W. L.; N. T.)

Socialist Soviet Republics: see UNION OF SOVIET SOCIALIST REPUBLICS.

Social Security. There was considerable activity in the field of social security during 1955, as some countries began operations under new programs, enacted new legislation or revised their laws governing programs already set up.

Finland was among the countries adopting new legislation in the first half of 1955; under a disability assistance law, cash payments are made to permanently disabled persons who are needy and not eligible for insurance. Canada's program to provide assistance to totally and permanently disabled persons, established by earlier legislation, began operating; and the German system of child allowances became fully effective. France extended the social insurance provisions to four *départements*—Guadeloupe, French Guiana, Martinique and Réunion. In Great Britain, many of the benefits and contributions under the national insurance and industrial injuries programs were increased.

United States.—Little legislation directly affecting social security or related programs was enacted by congress in 1955. The operations of the old-age and survivors insurance and public assistance programs reflected, however, the sweeping changes made by the 1954 amendments to the Social Security act. Some of these amendments were immediately effective, becoming operative in Sept. 1954. Others were effective Jan. 1, 1955.

The provision of employee benefits continued to be important in industry. Health, welfare and pension plans were included in at least half the collective bargaining agreements between management and labour in the first six months of 1955. Because of the continued growth of these plans, congress conducted studies to provide a basis for legislation designed to protect the interest of the employees covered. There was a further increase in the provision in industry plans of life insurance and hospitalization insurance for employees after retirement.

Social Insurance and Related Programs.—The federal old-age and survivors insurance program, administered by the Social Security administration of the department of health, education and welfare, provides monthly benefits related to previous earnings to insured workers and self-employed persons upon retirement at age 65 or later and supplementary benefits to their dependent, minor children; to their wives if aged or having such entitled children in their care; and to the dependent aged husbands of women workers. The program also pays survivor benefits to the widows and children; to dependent, aged parents; and dependent, aged widowers of deceased, insured workers; as well as lump-sum death payments. As of June 30, 1955, the average monthly benefit for a retired worker was \$61.03 and for an aged widow or widower it was \$46.61.

These averages reflected not only the increases voted by congress in 1954 to all beneficiaries under the program, but also the higher amounts resulting from the dropout provision in the amendments. Under this provision, workers coming on the rolls after Aug. 1954 and meeting certain requirements may have up to four years of lowest earnings ignored in the determination of their benefit amount; if they have 20 quarters of coverage they may have five years of low earnings dropped.

The amendments also protect the benefit rights of disabled workers. A person with a prolonged total disability who meets specified conditions may have his wage record frozen for the

period of the disability. When the time comes for computing the monthly benefit, the years that he was unable to work because of disability will not be counted against him. Retired workers who were currently receiving benefits and who applied for the "freeze" before July 1957 would receive any increase retroactively to July 1955—the first month for which the increased benefits could be paid.

Beneficiaries aged 72 may receive their benefits, regardless of any income from earnings. Before that age, persons earning more than \$1,200 a year lose one month's benefit for each \$80 or fraction thereof in excess of \$1,200, but they lose no benefits for months in which they do not earn \$80 or render substantial service in self-employment.

The 1954 amendments made coverage of old-age and survivors insurance practically universal; at the beginning of 1955 about nine out of ten of the nation's jobs were covered. Still excluded were self-employed lawyers, physicians, dentists and members of several other medically related professions, most federal civilian employees, members of the armed forces, and policemen and firemen covered by a state or local government retirement system.

The program is financed by contributions from employers and employees and from the self-employed on the basis of their taxable earnings up to a maximum of \$4,200. For the employer and employee the contribution rate was 2% each in 1955; it was scheduled to rise to 2½% in 1960, to 3% in 1965 and to 3½% in 1970, and it would be 4% in 1975 and thereafter. For the self-employed the rate of contributions is 1½ times the employee rate. At the end of June 1955, almost 7,600,000 old-age and survivors insurance beneficiaries were receiving benefits at a monthly rate of \$384,000,000.

Monthly retirement, long-term disability and survivor benefits were also being paid under other public programs. In June 1955 such benefits were going to 612,800 persons under the railroad retirement program, to 3,823,000 under the veterans' programs, and to 295,600 under the federal civil service. Programs for state and local government employees were paying retirement, disability and survivor benefits to a large group of beneficiaries. For temporary disability that was not work-connected, benefits were being paid in four states and in the railroad industry. For work-connected disability, workmen's compensation programs were in effect for workers in all states and for federal employees.

The state-federal system of unemployment insurance pays benefits to qualified unemployed workers. The programs are financed by employer contributions and, in two states, employee contributions. The federal aspects of the program are administered by the department of labour. In June 1955 a weekly average of 1,056,200 unemployed workers drew benefits; total benefits in the month were \$108,861,000. Workers in 11 states had their weekly benefits supplemented by small allowances for their dependents. Under the Railroad Unemployment Insurance act about \$3,468,000 was paid in June 1955 to an average (in a 14-day period) of 31,600 unemployed railroad workers.

Assistance and Welfare.—Four special types of public assistance were established by the Social Security act—old-age assistance, aid to dependent children, aid to the blind and aid to the permanently and totally disabled. These programs are administered by the states or the local communities or both; the federal government shares in the costs within certain maximum amounts. Expenditures, federal, state and local, for assistance and administration of the four programs during the year ended Dec. 31, 1954, totalled about \$2,562,000,000. In June 1955, 2,548,600 needy persons aged 65 or over were receiving old-age assistance (the average payment was \$52.30); 2,239,500 persons, including 1,691,700 children, in 620,300 families were

receiving aid to dependent children (average payment per family, \$86.78); 103,900 persons were receiving aid to the blind (average payment, \$57.41); and 236,800 persons in 43 states were receiving aid to the permanently and totally disabled (average payment, \$54.93). About 310,000 cases (720,000 persons) were receiving general assistance, financed by states and localities without federal funds; the average payment per case was \$53.78.

The Social Security act also authorizes federal grants to the states to extend and improve their maternity services for mothers and their health and welfare services for children, including services for crippled children. These grants are administered by the children's bureau.

During the year ended June 30, 1955, \$11,919,292 was paid to the states for maternal and child health services. Typical services were prenatal clinics, child-health conferences, immunizations, public health nursing services, and health services for children of school age by physicians and dentists. Federal payments to the states for services for crippled children totalled about \$10,613,701; the programs provided diagnostic, medical and surgical services and hospital and convalescent care. Federal payments of about \$6,725,553 were made to help the states, through their child welfare programs, protect and care for homeless, dependent and neglected children and children in danger of becoming delinquent. (C. I. S.)

Canada.—The federal-provincial disability allowances program was commenced during 1955. Under this scheme, allowances of up to \$40 monthly, as under the old-age assistance and blindness allowance programs, are paid to totally and permanently disabled persons aged 18 and over. The program is administered provincially with the costs of the allowances shared equally by the federal government.

The Blind Persons act was amended by reducing the age of eligibility from 21 to 18 years and by a liberalization of the means test. The Unemployment Insurance act was extensively revised to effect changes in the contribution structure, to decrease the maximum duration of benefit and to increase the minimum duration.

A federal-provincial conference was convened in the spring and again in October to consider the sharing between the federal and provincial governments of the costs of unemployment assistance (for persons outside the coverage of unemployment insurance) and to discuss health and welfare matters, including possible federal-provincial co-operation in the launching of a nation-wide system of health insurance.

Agreements were in the process of being worked out with those provinces desiring to enter into a sharing arrangement with the federal government on unemployment assistance costs. Arising out of the October conference, there was established an intergovernmental committee of ministers of health and finance to study a variety of proposals and alternatives for introducing health insurance by stages as soon as a majority of the provinces, representing a majority of the Canadian people, indicated their readiness to proceed. (G. Cy.)

Great Britain.—Changes in the national insurance scheme in 1955 raised the standard rates of unemployment benefit, sickness benefit and of the retirement pension at minimum pension age to 40s. a week for a single person and to 65s. for a married couple. Widow's pension was increased to 40s. a week and widow's allowance (for the first 13 weeks of widowhood) to 55s. The allowance for the first or only dependent child was increased to 11s. 6d. a week and for each other child to 3s. 6d. a week. Maternity grant became £10, home confinement grant £4 and maternity allowance 40s. a week. Guardian's allowance rose to 18s. a week. Benefits under the industrial injuries scheme were also increased. Industrial injury benefit rose to 67s. 6d.

a week for a single person and 92s. 6d. for a married couple. Disablement pension rose to 67s. 6d. a week for 100% disability, with proportionate increases for smaller assessments. Maximum disablement gratuity was raised to £225. Unemployment supplement was increased to 40s. a week; maximum rate of constant attendance allowance to 30s. (60s. in exceptionally severe cases) and maximum weekly rate of special hardship allowance to 27s. 6d. Weekly rates of contributions for national insurance and industrial injuries rose by 1s. for both employers and employed men and women, with correspondingly increased rates for self-employed and nonemployed. It was estimated that the contribution increases for national insurance, including an additional £23,000,000 from exchequer supplements, would produce about £116,000,000 a year with little variation over the next 25 years. Extra expenditure on benefits for the first full year was expected to be about £112,000,000 (of which £80,000,000 would go for retirement pensions), increasing in 25 years to £176,000,000 (£155,000,000 for retirement pensions). It was estimated that the cost of retirement pensions would rise from £436,000,000 out of a total expenditure of about £852,000,000 in 1955-56 to about £600,000,000 out of £1,095,000,000 in 25 years' time. Income would remain constant at about £650,000,000 to £675,000,000 a year.

National assistance rates were increased, bringing the normal scale for a single person living alone or as a householder, and as such indirectly responsible for rent and household necessities, up to 37s. 6d. a week and a married couple to 63s. a week. The regulations provided for a normal addition of payments in respect of rent. The personal allowance of a pensioner or recipient of national assistance in a residential establishment or in a hospital was increased to 7s. 6d. a week.

The report of the ministry of pensions and national insurance for 1954 showed that there were fewer persons receiving unemployment and sickness benefit. There were about 4,400,000 retirement pensioners. The total expenditure on all national insurance benefits during the year ended March 31, 1954, was £485,000,000, an increase of about £18,000,000 over the previous year. About 40% of pensions were awarded to men who had just reached 65 years and about 23% to men attaining or within three months of the age of 70. An inquiry into the reasons for retirement or staying at work showed that more than a quarter of the men had been retired by their employers or discharged although they considered themselves still fit for work. Of all the men taking retirement pensions 21% were still working at the age of 70.

The report of the national assistance board for 1954 showed that about 80,000 unemployed persons were receiving allowances. The total net expenditure of the board was about £130,000,000 of which about £104,000,000 was for national assistance grants and about £20,000,000 for noncontributory old-age pensions.

The report on war pensions for 1954 was published jointly by the minister of pensions and national insurance, the minister of health and the secretary of state of Scotland. The number of war pensions fell during the year by 30,882 to 900,141. Of these 494,826 related to World War II and later service, and 405,315 to World War I and earlier wars. More than 52,000 war pensioners sought the advice of welfare officers stationed at the ministry's offices.

Other Countries.—In the German Federal Republic provision was made for the payment of child allowance at 25 DM. a month to persons in employment, and to self-employed persons provided that they had three or more children and were insured or belonged to one of the professions exempted from compulsory insurance. The allowances were payable until a child completed his 18th year, or over 18 if he had not completed his

25th year and was maintained at the expense of the claimant while being trained for an occupation. In Italy new regulations were made prescribing the relations between doctors and the National Sickness Allowances institute. Where hospital treatment was provided the hospital doctor received remuneration for each patient under a fixed scale. In Greece provisions to assist persons suffering from tuberculosis were instituted. In Sweden a new scheme provided for a transition from the voluntary health care scheme covering 60% of the population to a compulsory scheme with almost universal coverage. Every person was required to be enrolled with a local sick fund.

In New Zealand increases of £6 10s. were made in the basic rates of social security benefits, bringing the maximum up to £182 a year. Orphans' pensions were increased to £84 10s. a year and mothers' allowances to £123 a year for a widow with one dependent child and to £149 10s. a year for a widow with two or more dependent children. There were also improvements generally in the schemes of social security operating in Belgium, Canada, Italy and France. In Argentina provision was made for compulsory insurance of self-employed persons, independent employers and professional workers. Reciprocal arrangements were brought into force between the Netherlands and the German Federal Republic. (See also BUDGET, NATIONAL.)

Social Service: see CHILD WELFARE; SOCIAL SECURITY.

Societies and Associations, U.S. The following is a selected list of U.S. societies and associations, with date of founding, membership, officers and chief activities during 1955.

(See also the separate articles on RED CROSS; VETERANS' ORGANIZATIONS, U.S.; etc.)

Alcoholics Anonymous.—Alcoholics Anonymous is a fellowship of men and women organized in 1935 to help the alcoholic recover. The only requirement for membership is stated to be "an honest desire to stop drinking." In 1955 there were 131,619 members in 5,927 groups throughout the world. The organization publishes the book *Alcoholics Anonymous*, the monthly *The A.A. Grapevine* and various other books and pamphlets. Officers' names are not given because of the organization's tradition of anonymity. It is supported solely through voluntary contributions. The general service board of Alcoholics Anonymous, formerly known as the Alcoholic Foundation, Inc., is the general service headquarters for the organization. Headquarters: P.O. Box 459, Grand Central Annex, New York 17, N.Y.

Altrusa International, Inc.—Founded and incorporated in 1917, this organization's purpose was to provide a main channel through which professional and executive women in diversified occupations might join forces to work for community and world improvement. Membership, 1955: 13,700 in 350 clubs located in the U.S., Canada, Great Britain, Guatemala, Mexico, Bermuda and Puerto Rico. In 1955 the organization carried out projects in public affairs, vocational information and international relations, and awarded grants to Latin American women graduates, who were in the U.S. for higher study, to assist them in finishing their training in chosen vocations. Publication: *International Altrusan*. Officers (1955) included: Mrs. Erma B. Christy, president; Mrs. Edith W. Nelson, president-elect. Headquarters: 332 S. Michigan Ave., Chicago 4, Ill.

American Academy of Arts and Letters.—The purpose of the academy, founded in 1904, is "furthering the interests of literature and the fine arts in America." In 1955 the academy consisted of 47 members chosen from the 250 members of its parent organization, the National Institute of Arts and Letters. On May 25, 1955, the joint annual ceremonial with the National Institute of Arts and Letters was celebrated. There were many exhibitions, notably the manuscript exhibition showing the development of American poetry since 1912. Publications include *Proceedings*, an annual, and *Yearbook of the National Institute and the American Academy*. Officers during 1955 were: Archibald MacLeish, president; Mark van Doren, chancellor; Douglas Moore, secretary; Deems Taylor, treasurer. Headquarters: 633 W. 155th St., New York 32, N.Y.

American Academy of General Practice.—The academy was founded in 1947 to promote high standards in the general practice of medicine and surgery, to encourage medical students to qualify for and establish themselves in general practice, to assure the right of the general practitioner to engage in medical and surgical procedures for which he is qualified and to develop postgraduate study programs for general practitioners. Membership, which is open to all physicians engaged in the general practice of medicine and surgery, numbered 19,883 in 1955. The Annual Scientific assembly of postgraduate training was held. A national survey of the scope of general practice was conducted. The academy has no endowment, its activities being supported by membership fees. Publication: *"GP"* (monthly). Officers (1955) included John R. Fowler, president; M. F. Cahal, Kansas City, Mo., executive secretary. Headquarters: 40 W. 34th St., Kansas City 11, Mo.

American Academy of Political and Social Science.—Founded in 1889 and incorporated in 1891, this organization acts as a forum for the discussion of social, political and economic questions through meetings and publications. The general topic of the annual meeting of the academy, held April 1–2, 1955, was "Internal Security and Civil Rights." Membership in 1955 was 15,384. Publication: *The Annals*, a bimonthly journal. Officers (1955) included: Thorsten Sellin, acting president; Raymond T. Bowman, secretary. Headquarters: 3937 Chestnut St., Philadelphia 4, Pa.

American Association for the Advancement of Science.—Founded in 1848, this association seeks to further the work of scientists, facilitate co-operation among them and improve public understanding of the importance of science in human progress. Its membership in 1955 was 48,660. During 1955 the annual national meeting was held in Atlanta, Ga. Publications: *Science*, weekly; *Scientific Monthly*; and others. Officers (1955) included: George W. Beadle, president; Dael Wolfe, administrative secretary. Headquarters: 1515 Massachusetts Ave., N.W., Washington 5, D.C.

American Association of University Professors.—This organization of college and university teachers was founded in 1915 to promote discussion and action on problems affecting education in institutions of higher learning, and to provide means for expression of its membership. Its membership in 1955 was 43,615. Publication: the *Bulletin*, a quarterly journal. Officers (1955) included: William E. Britton, Hastings College of Law, president; Ralph Fuchs, general secretary. Headquarters: 1785 Massachusetts Ave., N.W., Washington 6, D.C.

American Association of University Women.—This organization was founded in 1882 as the Association of Collegiate Alumnae for "the uniting of the alumnae of different institutions for practical educational work." Maintenance of high standards of education and more effective participation of college women in the processes of democracy. Membership in 1955 totalled more than 137,000. Its principal activity of 1955 was a study-action program in the fields of education, international relations, social studies, status of women, the arts and legislation. Publications: *Journal*, quarterly, the *General Director's Letter*, handbooks, study guides and bibliographies. Endowed funds totalled \$1,316,000 in 1955. Officers (1955) included: Anna L. Rose Hawkes, president; Helen D. Bragdon, general director. Headquarters: 1634 I St. N.W., Washington 6, D.C.

American Bankers Association.—Founded in 1875, the primary objective of this organization is to promote the general welfare and usefulness of banks and financial institutions. In 1955 it had a membership of 17,140 banks and banking offices. It is the parent organization of the American Institute of Banking for bank employees and the Graduate School of Banking for bank officers. In 1955 the association's program was devoted to the support of sound money and, through sound credit policies, to the stemming of inflationary pressures. The educational program was expanded to provide for executive development. During 1955 officers included: Fred F. Florence, Republic National Bank of Dallas, Tex., president; Erle Cocke, The Fulton National Bank, Atlanta, Ga., vice president; George R. Boyles, Merchants National Bank, Chicago, Ill., treasurer. Headquarters: 12 E. 36th St., New York 16, N.Y.

American Bar Association.—Founded in 1878 to advance the science of jurisprudence and promote the administration of justice in the U.S., the association had a membership of more than 58,000 in 1955. In 1955 the association put into operation its first nation-wide group life insurance program and began, through the American Bar Foundation, a major research study of the administration of criminal justice in the U.S. Its publications include the *American Bar Association Journal*, monthly, an annual volume of reports and proceedings, and various pamphlets. Officers (1955) included: E. Smythe Gambrell, Atlanta, Ga., president; John D. Randall, Cedar Rapids, Ia., chairman of the house of delegates; Joseph D. Stecher, secretary; Harold H. Bredell, treasurer. Headquarters: 1155 E. 60th St., Chicago 37, Ill.

American Bible Society.—Founded in 1816, the society encourages the wider circulation and use of the Holy Scriptures without note or comment and without purpose of profit. During 1955 translations of the Bible were being made in a number of languages, and there was much activity in revisions. Volumes issued from the Bible House in New York City in 1954 set a new record for the society of 15,391,171 volumes. Works for the blind were distributed in 40 languages and systems. Membership (1955): about 200,000. Publication: *The Bible Society Record*. Officers (1955) included: Eric M. North and Robert T. Taylor, general secretaries; William F. Asbury, recording secretary; Gilbert Darlington, treasurer. Headquarters: 450 Park Ave., New York 22, N.Y.

American Cancer Society.—Founded in 1913, the organization is devoted to cancer control in the U.S. by means of public and medical education, service to patients and research to discover causes and cures for cancer. The society operates through a national organization and 60 chartered divisions in the U.S., District of Columbia and Alaska, and ten metropolitan areas. In 1955 more than 3,000 active units were served by about 1,250,000 volunteers. In 1955 the society sponsored a clinical fellowship program for advanced training of physicians; alerted the public to threat of cancer by campaigns; and aided patients through hospital clinics. For the 1955–56 research year 466 grants and fellowships totalling \$5,923,804 were awarded 153 universities and scientific institutions. Publications: *Cancer News*, quarterly; *Cancer*, bimonthly; *CA*, bimonthly medical digest; *Annual Report*. The funds of the society are secured through public contributions. Officers (1955): Howard C. Taylor, Jr., president; Lane W. Adams, treasurer; and Granville Whittlesey, Jr., secretary. Headquarters: 521 West 57th Street, New York 19, N.Y.

American Chemical Society.—Founded in 1876 to encourage the advancement of chemistry in all its branches, this organization endeavours to promote "research in chemical science and industry" and to maintain high standards among its members. In 1955 membership totalled 74,342. The association held two national meetings during 1955 and conferred 13 medals for outstanding accomplishments in chemistry. Publications include *Journal of the American Chemical Society*; *Chemical Abstracts*; *Industrial & Engineering Chemistry*; *Chemical and Engineering News*; *Journal of Physical Chemistry*; *Journal of Organic Chemistry*; *Journal of Agricultural and Food Chemistry*; *Analytical Chemistry*. Officers

(1955) included: Joel H. Hildebrand, president; Alden H. Emery, executive secretary. Headquarters: 1155 16th St., N.W., Washington 6, D.C.

American College of Dentists.—The association was formed in 1920 to advance the standards and efficiency of dentistry, stimulate graduate study in dentistry, confer fellowships in recognition of meritorious achievement especially in dental science, art and literature and improve public understanding of oral health service. Membership in 1955 was 2,100. Activities throughout 1955 included Teacher's Training Fellowship award grants for graduate study and committee studies of various problems relating to dental health service. Publication: *Journal of the American College of Dentists* (quarterly). Officers (1955): James H. Ferguson, Jr., Baltimore, Md., president; C. V. Rault, Washington, D.C., vice-president; Otto W. Brandhorst, St. Louis, Mo., secretary. Headquarters: 4221 Lindell Blvd., St. Louis, Mo.

American College of Hospital Administrators.—Founded on Feb. 13, 1933, for the purpose of improving the care of the sick through the elevation of standards for hospital administration, the association conducts and promotes educational training, promotes adherence to a code of ethics and provides recognition for noteworthy service in the field of hospital administration. The 21st annual meeting was held in Atlantic City, N.J., Sept. 17–19, 1955. In 1955 membership totalled approximately 3,000. Publications: *ACHA News*, monthly; *Roster*, annual. Officers (1955): A. C. Kerlikowske, president; D. Conley, executive director. Headquarters: 620 N. Michigan Ave., Chicago 11, Ill.

American College of Life Underwriters.—Founded in 1927 to establish an educational standard for the profession of life underwriting and to encourage sound life insurance education in colleges and universities, the college grants the Chartered Life Underwriter (C.L.U.) designation to candidates who pass five examinations in subjects related to life insurance (such as economics, government, social problems, law, taxes, trusts, etc.) and meet the college's requirements of experience and character. A total of 5,755 persons had attained the designation, and 8,097 had earned partial credit toward the designation by passing from one to four of the examinations. At the 28th conferment in Aug. 1955, 407 successful candidates became C.L.U.'s. In June 1955, 3,630 candidates took 4,524 examinations in 158 university locations. Publications: *Announcement*, *Annual Report*, *C.L.U. Annual Review*, brochures and material for teachers and candidates. Officers (1955–56): Julian S. Myrick, chairman of the board; Davis W. Gregg, president. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American College of Physicians.—This society was founded in 1915 to bring together physicians of high standing for the maintenance and advancement of medical education, practice and research. Activities in 1955 included the 36th annual session at Philadelphia, Pa., April 25–29, plus 32 regional state or multistate meetings and participation in many joint endeavours with other medical associations. The college also awarded 6 research fellowships and 13 Latin-American fellowships for training Latin-American men for teaching and research in their homelands. Membership in 1955 totalled approximately 8,919. Publications include a directory and *Annals of Internal Medicine*, monthly. Endowment funds totalled \$441,215.45. Officers (1955) included: George F. Strong, Vancouver, B.C., Can., president; William D. Stroud, Philadelphia, Pa., treasurer; Richard A. Kern, Philadelphia, Pa., secretary-general; Edward R. Loveland, Philadelphia, Pa., executive secretary. Headquarters: 4200 Pine St., Philadelphia 4, Pa.

American College of Surgeons.—Founded in 1913 to advance the science of surgery, the organization held its 41st annual clinical congress in Chicago, Ill., Oct. 31–Nov. 4, 1955. Membership of the college in 1955 was 20,750. Publications: *Surgery, Gynecology and Obstetrics*, a monthly scientific journal and the *Bulletin*, a bimonthly. Officers (1955) included: Alfred Blalock, president; Warren H. Cole, president-elect; Michael L. Mason, secretary. Headquarters: 40 E. Erie St., Chicago 11, Ill.

American Correctional Association (formerly American Prison Association).—Founded in 1870 and incorporated in 1871, this association works for the improvement of laws governing public offenders, studies the causes of crime and the nature of offenders and their social surroundings, works for the improvement of penal institutions, and is concerned with the care of and provision of jobs for former prisoners. In 1955 the association sponsored the 85th annual congress of correction. Membership in 1955 was about 2,000, consisting of court, crime-enforcement and penal officials and citizens interested in crime problems. Publications: *American Journal of Correction* (formerly *Prison World*), bimonthly, *Directory of State and National Correctional Institutions*, annual, *Manual of Correctional Standards*, *Manual of Criminal Statistics*, and others. Officers (1955): Kenyon J. Scudder, president; E. R. Cass, general secretary; John L. Schoenfeld, treasurer. Headquarters: 135 E. 15th St., New York 3, N.Y.

American Dental Association.—Founded in 1859 "to encourage the improvement of the health of the public and to promote the art and science of dentistry," this professional association numbered 84,497 members as of Oct. 31, 1955. It continued support of measures to add fluoride salts to community water supplies to reduce incidence of tooth decay, and by Sept. 1955, more than 1,100 U.S. cities and towns were fluoridating their water supplies. The association in February sponsored its annual national children's dental health day. The 96th annual session of the association was held in San Francisco, Calif., Oct. 17–20, 1955. Publication: *Journal of the American Dental Association*. Officers (1955–56): Bernard C. Kingsbury, president; Harold Hillenbrand, secretary; H. B. Washburn, treasurer. Headquarters: 222 E. Superior St., Chicago 11, Ill.

American Dialect Society.—This organization was founded at Harvard university in 1889 to collect, study and publish material on the English language, especially dialect as found in North America, together with other languages influencing it or influenced by it. Eight research committees were later formed to study the following: regional speech and localisms, place names, linguistic geography, usage, non-English dialects, new words, semantics and proverbial sayings. Membership in 1955 was 514. The annual meeting was held in Chicago, Ill. Publication: *Publication of the American Dialect Society*. Officers (1955) included: James B. McMillan, president; Thomas Pyles, secretary-treasurer. Headquarters: University of Florida, Gainesville, Fla.

American Economic Association.—This association, which in 1955 had 7,800 members and 2,900 library, corporate and individual subscriptions, was founded in 1885 to encourage economic research and freedom of economic discussion, and to issue publications on economic subjects. The annual meeting was held in New York, N.Y., Dec. 28-30, 1955. Publications include the *American Economic Review*, quarterly; *Papers and Proceedings* of the annual meeting. Officers (1955) included: John D. Black, Harvard university, president; James Washington Bell, Northwestern university, secretary-treasurer and editor of the annual proceedings; Bernard F. Haley, Stanford university, managing editor of the quarterly. Headquarters: Northwestern university, Evanston, Ill.

American Geographical Society.—This organization was founded in 1852 to promote geographical research and exploration and to disseminate geographical knowledge. During 1955, the research activities of the society centered on medical geography; mathematical geography with respect to map projections; glacial investigations; preparations of a series of geographical handbooks on strategic areas; and a new planning-scale map of Africa and Europe in four sheets. Publications include *Geographical Review*, quarterly, and *Focus*. Membership (1955): about 4,500. Officers (1955) included: Richard Upjohn Light, president; Charles B. Hitchcock, director. Headquarters: Broadway at 156th St., New York 32, N.Y.

American Historical Association.—This association of professional and nonprofessional students of history, founded in 1884, was organized "for the promotion of historical studies, the collection and preservation of historical manuscripts, and for kindred purposes in the interests of American history. . . ." It was incorporated by act of congress in 1889. The association's membership in 1955 was 6,135, and its endowment was about \$600,000. Publications include the *American Historical Review*, *Annual Report*, and selected historical monographs. Officers (1955) included: Lynn Thorndike, president; Boyd C. Shafer, executive secretary and managing editor. Headquarters: Study Room 274, Library of Congress Annex, Washington 25, D.C.

American Institute for Property and Liability Underwriters, Inc.—Founded in 1942, the purpose of this organization is to establish and administer an educational standard for the profession of property and casualty insurance underwriting. Examinations are conducted annually in June at more than 115 locations. Those who successfully pass the examinations and fulfill the experience and ethical requirements are awarded the designation Chartered Property Casualty Underwriter (C.P.C.U.). By 1955 1,268 persons had received the C.P.C.U. designation. The institute receives financial support from property and casualty insurance companies and organizations. Publications: *Announcement*, annual, and *C.P.C.U.—Its Purpose and Meaning*. Officers (1955): S. S. Huebner, chairman of the board; Guy T. Warfield, president; Harry J. Loman, dean; A. C. Goerlich, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American Institute of Accountants.—A national professional society of certified public accountants, founded in 1887 to maintain high professional and ethical standards, to develop accountancy education and to provide for the examination of candidates for membership. In 1955 the institute had a membership of 26,345. The year's activities included the preparing of the uniform C.P.A. examination given in 48 states, and the issuing of bulletins on accounting procedure and case studies in auditing procedure. The annual meeting was held Oct. 22-27, 1955. Publications: *Journal of Accountancy* and *Certified Public Accountant*, both monthly; *The C.P.A. Handbook*; *Accounting Trends and Techniques in Corporate Annual Reports*; and others. Officers (1956) included: John H. Zebley, Jr., president; J. L. Carey, executive director. Headquarters: 270 Madison Ave., New York 16, N.Y.

American Institute of Architects.—The objects of this organization, founded in 1857, are "to promote the aesthetic, scientific and practical efficiency of the architectural profession; to advance the standards of architectural education, training and practice; and to co-ordinate the building industry and the profession of architecture." Membership in 1955 was 10,200. Publications: *Journal*, monthly; *Bulletin*, bimonthly; and *Memo*, biweekly. Officers (1955) included: George B. Cummings, president; Edward L. Wilson, secretary; Leon Chatelain, Jr., treasurer. Headquarters: 1735 New York Ave. N.W., Washington 6, D.C.

American Institute of Chemical Engineers.—This organization was founded in 1908 for the advancement of chemical engineering in theory and practice and the maintenance of a high professional standard among its members. As of May 1955, the membership was 14,700. Publications: *Chemical Engineering Progress*, monthly; *Journal*, quarterly. Officers (1955) included: Barnett F. Dodge, president; F. J. Van Antwerpen, secretary. Headquarters: 25 W. 45th St., New York 36, N.Y.

American Institute of Electrical Engineers.—This association was founded in 1884 to advance the theory and practice of electrical engineering and of allied arts and sciences and to maintain a high professional standing among its members. Its 1954-55 activities included four general meetings with 9,250 persons in attendance, three district meetings and 22 special technical conferences. The institute participated in many engineering activities with other societies and there was also much activity in the technical divisions and technical committees in advancing developments in the fields of science and art. Membership in 1955 was 49,664. Endowment funds as of 1955: \$1,250,000. Publications: *Electrical Engineering*, monthly; *Transactions*, annually; *Preprints* and special publications, published irregularly. Officers (1955): M. D. Hooven, president; N. S. Hibshman, secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Institute of Mining and Metallurgical Engineers.—This society was founded in 1871 to promote the arts and sciences connected with the economic production of minerals and metals and the welfare of the individuals employed in these industries. The regular annual meeting was held in Feb. 1955. In 1955 there were 22,290 members and 1,762 student associates. Publications: *Mining Engineering*, *Journal of Metals* and *Journal of Petroleum Technology*, all monthly. The institute's endowments totalled \$1,185,268 in 1955. Officers (1955) included: H. DeWitt Smith, president, and E. O. Kirkendall, secretary. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Iron and Steel Institute.—In 1908 this organization was founded to promote the interests of the iron and steel industry, distribute information and promote discussion of problems relating to the industry.

During 1955 the organization was active in research, public relations, statistics, engineering and industrial relations, including health and safety. Its 1955 membership included 2,500 active, associate, honorary and emeritus members, and 95 company members. Publications: *Steelways* and *Steel Facts*, both bimonthly, and numerous booklets and pamphlets. Officers (1955) included: B. F. Fairless, president; Max D. Howell, executive vice-president; George S. Rose, secretary. Headquarters: 350 Fifth Ave., New York 1, N.Y.

American Law Institute.—Founded in 1923, the purpose of this organization is to promote the clarification and simplification of the law and its better adaptation to social needs. In 1955 the committee on continuing legal education conducted and sponsored numerous courses and lectures throughout the country, and started *The Practical Lawyer*, a periodical. Work continued in 1955 on the drafting of a federal income, estate and gift tax statute and further drafts of a five-year project to draft a code of substantive criminal law were completed. In 1955 there were 1,315 elected members. Officers (1955) included: Harrison Tweed, president; Herbert F. Goodrich, director and secretary; Bernard G. Segal, treasurer. Headquarters: 133 S. 36th St., Philadelphia 4, Pa.

American Mathematical Society.—This organization was established in 1888 to further the interests of mathematical scholarship and research. Publications: *Bulletin of the American Mathematical Society*; *Proceedings of the American Mathematical Society*; *Transactions of the American Mathematical Society*; and *Mathematical Reviews of the American Mathematical Society*. Membership in 1955 was approximately 5,000. Officers (1955) included: R. L. Wilder, president; E. G. Begle, secretary. Headquarters: 80 Waterman St., Providence 6, R.I.

American Medical Association.—This federation of constituent state and territorial medical associations was founded in 1847 to promote the science and art of medicine and the betterment of public health. Activities during 1955 included the evaluation of new drugs, foods, physical medicine devices and techniques; the approval of medical schools; the evaluation and registration of hospitals for internship and residency training programs; the provision of two postgraduate training meetings for physicians. Publications: *The Journal of the American Medical Association*; *American Medical Directory*; *Today's Health*, a monthly magazine; and special publications. Membership in 1955 was approximately 153,000. Officers (1955): Elmer Hess, Erie, Pa., president; Dwight H. Murray, Napa, Calif., president-elect; George F. Lull, Chicago, Ill., secretary and general manager. Headquarters: 535 N. Dearborn St., Chicago 10, Ill.

American Optometric Association.—Founded in 1897, this organization's purpose is to promote the visual welfare of America and serve the professional interest of optometrists. During 1955 the association engaged in public information programs; produced a motion picture "Adventures in Seeing"; held the annual congress at Milwaukee, Wis.; and held seminars on children's vision, occupational vision and motorists' vision. Membership in 1955 totalled 11,000. The association sponsored "National Save Your Vision Week" Mar. 6-12, 1955. Publication: *Journal of the American Optometric Association*, published monthly. Officers (1955) included: Norman B. Hays, president; H. Ward Ewalt, treasurer; E. H. Kiekenapp, secretary. Headquarters: 4030 Chouteau Ave., St. Louis 10, Mo.

American Society of Agricultural Engineers.—This organization was organized in 1907 to promote the science and art of engineering in agriculture, to encourage original research and to co-operate with other groups in broadening the usefulness of agricultural engineering. In 1955 it had 4,600 members. Publications were *Agricultural Engineering* (monthly) and *Agricultural Engineers Yearbook*. Wayne H. Worthington was president in 1955; Raymond Olney, treasurer. Headquarters: 420 Main St., St. Joseph, Mich.

American Society of Civil Engineers.—Founded in 1852 as the first national engineering group, the society's sphere of influence encompasses technical advances in the profession as well as the professional advancement of its membership. In 1955 the society membership was 38,737. Organized for the purpose of advancing the sciences of engineering and architecture, the society directs professional activities from its headquarters in New York city, through 74 local sections and student chapters in 132 engineering colleges; also the 13 following technical divisions: air transport, city planning, construction, engineering mechanics, highways, hydraulics, irrigation and drainage, power sanitary engineering, soil mechanics and foundations, structural, surveying and mapping and waterways. Publications: *Proceedings*, monthly; *Transactions*, yearly; *Civil Engineering*, monthly; a *Directory* (membership list); and a *Register* (organization details). Officers (1955): W. R. Glidden, president; William H. Wisely, executive secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Society of Composers, Authors and Publishers (ASCAP).—Founded in 1914, the society, a voluntary, nonprofit unincorporated association, collects performing right royalties for allocation to members whose copyrighted musical works are used in public performances for profit. In 1955 3,300 writers and 700 publishers were members. Officers (1955) included: Stanley Adams, president; Louis Bernstein and Otto A. Harbach, vice-presidents; John Tasker Howard, secretary; Saul H. Bourne, treasurer. Headquarters: 575 Madison Ave., New York 22, N.Y.

American Society of Heating and Air-Conditioning Engineers.—This society, whose purpose is to improve the science of heating, ventilating cooling and air-conditioning, was incorporated as the American Society of Heating and Ventilating Engineers. It changed its name in 1955. The organization maintains a research laboratory which, from its inception in 1919 to 1955, had spent about \$2,000,000 on research activities. Membership in 1955 was approximately 10,096. Publications: *Transactions*, annual, *Heating, Piping and Air Conditioning*, monthly, and *Heating Ventilating and Air Conditioning Guide*. Officers (1955) included: John E. Haines, president; E. R. Queer, treasurer; and A. V. Hutchinson, executive secretary. Headquarters: 62 Worth St., New York 13, N.Y.

American Society of Mechanical Engineers.—This organization was founded in 1880 to promote the art and science of mechanical engineering, to encourage original research, to foster engineering education, to advance the standards of engineering and to promote interchange of ideas among engineers themselves. In 1955 the society held five national meetings

commemorating its 75 years of existence, climaxed by the annual meeting in Chicago, Ill., Nov. 13-18. In addition, meetings were held by the 83 local sections, 12 subsections and the 137 student branches. Membership totalled 40,000 in 1955. Publications: *Mechanical Engineering and Applied Mechanics Reviews*, both monthly; *Journal of Applied Mechanics*, quarterly; *ASME Mechanical Catalog and Directory*, annual. Officers (1955): David W. R. Morgan, president; C. E. Davies, secretary; J. L. Kopf, treasurer. Headquarters: 29 W. 39th St., New York, N.Y.

American Sunday-School Union.—The purpose of this organization, founded in 1817 as the Sunday and Adult School union, is "to organize and maintain Sunday schools in the rural areas of the United States and to publish and circulate Christian literature." During 1955, 1,538 vacation Bible schools were held with an enrolment of 46,140. More than 2,200 rural Sunday schools enrolled 88,550, and 112 Young People's Bible conferences were attended by more than 8,000 rural youths. The Pioneers for Christ, organized in 1952 for rural boys and girls of high school age, made rapid progress. Publications included a full line of Sunday-school periodicals. The work is supported largely by contributions and a small endowment. Officers (1955): James F. Shrader, president; Lester E. Spencer, secretary of missions; William J. Jones, editor of publications. Headquarters: 1816 Chestnut St., Philadelphia 3, Pa.

Arthritis and Rheumatism Foundation.—Founded in 1948 to formulate and carry out a national program of research and education in the rheumatic diseases, discover their causes and develop methods of prevention; and provide systematic rehabilitation for the disabled. In 1955 the foundation awarded 20 basic research fellowships, and distributed about 50,000 publications about arthritis to physicians. In 1955 there were 41 chapters which provided care to arthritics through foundation-supported facilities. Publications: *Bulletin on Rheumatic Diseases*; *Manual for Arthritis Clinics*; pamphlets and booklets. The foundation is supported by voluntary contributions. Officers (1955) included: Gen. George C. Kenney, president; James G. Blaine, secretary; Hayden N. Smith, executive committee chairman. Headquarters: 23 W. 45th St., New York 36, N.Y.

Boy Scouts of America.—This nation-wide youth organization with activities for boys of eight years and older was organized in 1910 and chartered by congress in 1916. Objectives are to teach patriotism and citizenship, character development and the importance of religion in daily life. In 1955 the 45th annual meeting of the national council was held in St. Louis, Mo. Membership as of April 30, 1955, was 2,800,177 boys and 1,020,759 adults in 52,659 scout troops, 34,397 cub packs, and 13,293 explorer units. Publications include *Scouting Magazine*, *Boys' Life* and *The Scout Executive*. Headquarters: New Brunswick, N.J.

Brookings Institution.—A nonprofit organization dedicated to public service through research and education in economics and government, the institution was incorporated on Dec. 8, 1927, and is supported by income from its own endowment, grants from foundations and the sale of publications. During 1955 the following studies were published: *Proposal for Changes in the United Nations*, by Francis Wilcox and Carl Marcy; and *The United Nations and the Maintenance of International Peace and Security*, by Leland M. Goodrich and Anne P. Simons. Officers (1955) included: Robert D. Calkins, president; Elizabeth H. Wilson, secretary; Mildred Maroney, treasurer; William R. Biggs, chairman of the board. Headquarters: 722 Jackson Place N.W., Washington 6, D.C.

Buhl Foundation.—Established in 1927, the foundation had by 1955 granted to existing (or especially established) agencies a total of \$9,807,000 for the promotion of nationally significant programs in the Pittsburgh district—in education, health, historical research and publication, and research in natural sciences. During the year ground was broken for a third unit of the foundation's Chatham Village, internationally known demonstration of a large-scale planned residential community built for long-term investment. The Buhl Planetarium, built and maintained as a memorial to the founder, had conducted a program of popular science education, from elementary school to adult level, since 1939. Foundation assets in 1955 were, book value, \$13,494,000. Director: Charles F. Lewis; headquarters: Farmers Bank Building, Pittsburgh 22, Pa.

Camp Fire Girls, Inc.—This youth organization, founded in 1910, aims "to perpetuate the spiritual ideals of the home" and "to stimulate and aid in the formation of habits making for health and character." In 1955 Camp Fire Girls observed Birthday week (theme: "Let Freedom Ring!"), March 13-20, and conducted a membership drive, Sept. 15 through Nov. 30. In 1955 more than 392,000 girls were enrolled in its three groups: Blue Birds, 7 to 9 years old; Camp Fire Girls, 10 to 15 years old; and Horizon club members, of senior high school age. Publications: *Book of the Camp Fire Girls*; *The Camp Fire Girl*, monthly; and others. National officers (1955) included: Mrs. Harold H. Hartman, president; John J. Wolkerstorfer, chairman of the board; Mrs. W. Harvey Young, secretary; Martha F. Allen, national director. Headquarters: 16 E. 48th St., New York 17, N.Y.

Carnegie Trusts.—Six autonomous and separately administered agencies in the U.S. were established by Andrew Carnegie for various philanthropic purposes; in addition, there are four Carnegie trusts in Great Britain, and Carnegie Hero funds operate in nine European countries.

Carnegie Corporation of New York (1911), with a basic endowment of \$135,000,000, had in 1955 assets of more than \$178,000,000; the income from \$12,000,000 of this is applicable in the British dominions and colonies. Its purpose is the advancement and diffusion of knowledge and understanding among the people of the U.S. and the British dominions and colonies. The primary interest is in the advancement of the social sciences and in the improvement of teaching. Grants totalling \$6,000,000 were awarded to institutions of higher education and organizations engaged in research and public education in 1955. President (1955), John W. Gardner; secretary, Florence Anderson. Headquarters: 589 Fifth Ave., New York 17, N.Y.

Carnegie Institute of Pittsburgh (1896) includes a department of fine arts, a music hall and a museum of natural history; to it are closely related the Carnegie Library of Pittsburgh, the Carnegie Library school and the Carnegie Institute of Technology. President (1955), James M. Boardman. Headquarters: 4400 Forbes St., Pittsburgh 13, Pa.

Carnegie Institution of Washington (1902), with assets exceeding \$48,-

000,000 in 1955, conducts fundamental scientific investigation, particularly in astronomy, terrestrial magnetism, geophysics, archaeology, plant biology, embryology, genetics and historical research. President (1955), Vannevar Bush; secretary, Paul A. Scherer. Headquarters: 1530 P St. N.W., Washington 5, D.C.

Carnegie Hero Fund Commission (1904), with assets in 1955 of approximately \$10,000,000, was established to recognize by medals and monetary awards heroic acts performed in the peaceful walks of life. President (1955), Thomas S. Arbutnot; manager, M. H. Floto. Headquarters: Oliver Building, Pittsburgh 22, Pa.

Carnegie Foundation for the Advancement of Teaching (1905) was established to provide retiring pensions for college teachers and to advance higher education. In addition to an original grant from Carnegie of \$13,000,000, by 1955 it had received sums amounting to more than \$33,000,000 from the Carnegie corporation for pension purposes and educational studies. President (1955), John W. Gardner; secretary, Florence Anderson. Headquarters: 589 Fifth Ave., New York 17, N.Y.

Carnegie Endowment for International Peace (1910) uses the income from its \$10,000,000 endowment to further friendly understanding among nations. President (1955), Joseph E. Johnson; secretary, Leslie Paffrath. Headquarters: United Nations Plaza at 46th St., New York 17, N.Y.

Catholic Community Service, National.—This service organization was founded on Nov. 13, 1940, to assist in meeting the religious, social and welfare needs of members of the armed forces, of workers and their families in defense industry areas and of patients in Veterans administration hospitals. During 1955 the service conducted volunteer work in 171 Veterans administration hospitals, staffed clubs of the U.S.O., and also published and distributed more than 500,000 religious publications. Publications: *NCCS News*; *NCCS-VA Hospital News*; several religious pamphlets; and *Greetings*, a pamphlet for young men about to be inducted into the armed forces. Thomas D. Hinton was executive director in 1955, and the Most Rev. Karl J. Alter was president. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Catholic Organizations for Youth.—The National Council of Catholic Youth is sponsored by the National Catholic Welfare conference. Its purpose is to foster the spiritual, cultural, social and physical activities, and to represent in the U.S. and abroad, all Catholic youth organizations. The College and University section includes the National Federation of Catholic College Students, reaching students in Catholic colleges, and the Newman Club federation, reaching Catholic students in nonsectarian colleges. The Diocesan section reaches Catholic organized youth who are outside the college and university field. Parish youth organizations throughout the country affiliate with the council through their Diocesan youth directors; eight national organizations also are affiliated with the Diocesan section. The national organizations include: Catholic Kolping Society of America, Catholic War Veterans of U.S.A., National Catholic Camping Association, Columbian Squires, Daughters of Isabella, Junior Catholic Daughters of America, The Queen's Work and the Catholic Total Abstinence union.

The total number of young persons reached by the various programs in 1955 was about 7,000,000. Publications include *Youth*, a magazine, and *Program Service*, a bi-monthly activities suggestion publication. Director: Msgr. Joseph E. Schieder. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Catholic Welfare Conference, National.—This organization was founded in 1919 to organize and co-ordinate the Catholic residents of the U.S. in works of education, social welfare, immigrant aid and other activities. It acts as a clearing house of information regarding activities of Catholic men and women. The National Council of Catholic Men produced in 1955 the weekly radio programs "Catholic Hour," "Christian in Action," and "Faith in Our Time" and the television programs "Catholic Hour-TV," "Look Up and Live" and the Catholic portion of "Lamp Unto My Feet." The membership of the conference was composed of the 209 archbishops and bishops of the U.S. and more than 16,000 affiliated lay societies. Officers (1955) included Karl J. Alter, archbishop of Cincinnati, O., chairman; Joseph E. Ritter, archbishop of St. Louis, Mo., secretary. The general secretary was the Msgr. Howard J. Carroll. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Chamber of Commerce of the United States.—A federation of businessmen's organizations founded in 1912, the chamber was organized "to promote a better understanding of the functions of American business enterprise and of the contribution of business to public well-being and to serve as a clearinghouse of business opinion on economic issues."

In 1955 the national chamber sponsored a number of national conferences on current issues such as national security; improvement of living standards; community development; economy and taxes; labour relations; education; and increasing the effectiveness of America's business organizations. In 1955 there were 3,138 organization members (state and local chambers of commerce and trade and industrial organizations), with an underlying membership of more than 1,600,000.

Publications: *Washington Report*, weekly; *Nation's Business*, monthly; newsletters; and special reports, papers, studies, etc. Officers (1955): A. Boyd Campbell, president; Richard L. Bowditch, chairman of the executive committee; Clem D. Johnston, chairman of the board. Headquarters: 1615 H St. N.W., Washington 6, D.C.

Charles Hayden Foundation.—This organization was established in 1937 under the will of Charles Hayden to assist young men to "receive proper training in boyhood and youth . . . in the manner of right and proper living." Its activities are devoted mainly to aiding boys' clubs, boys' camps and similar projects for underprivileged boys, especially those of the New York, N.Y., and Boston, Mass., areas. By Sept. 30, 1955, the foundation had contributed \$28,243,220 for these purposes, and there was approximately \$54,366,755 in the fund. Officers: Edgar A. Doubleday, president, secretary and treasurer; Erle V. Daveler, chairman of the board. Headquarters: 25 Broad St., New York 4, N.Y.

Civitan International.—This organization was founded in 1920 and its purpose is best explained by its motto, "Builders of Good Citizenship." During 1955 principal activities included work on the March of Dimes, Cancer Crusade, and Red Cross Campaigns, safety projects, and essay contests in high schools. Membership in 1955 was about 20,000. Publica-

SHRINERS parading down Michigan Ave., Chicago, Ill., during their 1955 national convention

tion: *The Civitan* magazine, edited monthly; informational booklets. Officers (1955) included: Roy M. Abagnale, president; Rudolph T. Hubbard, secretary. Headquarters: 1523-28 Comer Bldg., Birmingham 3, Ala.

Commonwealth Fund.—Established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and increased by other bequests, the fund amounted to approximately \$85,500,000 at the end of the fiscal year 1954-55. Appropriations for that year were \$3,469,973. The major concern of the fund in 1955 was helping medical schools to reorient medical education to the student and medical care to the patient, by better integration and increased attention to the relation between the patient and his environment. Grants for medical education, including fellowships in medicine and allied fields, amounted to \$2,370,721; for experimental health services \$137,750; and for medical research \$887,926. During the academic year 1955-56 57 persons were resident in the U.S. under Commonwealth fund fellowships, including 43 scholars, journalists and civil servants from Great Britain and other parts of the British Commonwealth and 14 scholars from western European countries. The fund publishes an annual report. Malcolm P. Aldrich was president in 1955. Headquarters: 1 E. 75th St., New York 21, N.Y.

Daughters of the American Revolution.—The National Society of the Daughters of the American Revolution was founded in 1890 for historical, patriotic and educational purposes. The society in 1955 had 179,920 members in 2,775 chapters. During the year it operated two schools and provided financial assistance to others; conducted programs for good citizenship; operated Junior American Citizens clubs; maintained a genealogical library; presented awards for citizenship qualifications in accredited high schools. Publications: *Daughters of the American Revolution Magazine* and *Press Relations Digest*. Gertrude S. Carraway was president general in 1955. Headquarters: 1776 D St. N.W., Washington 6, D.C.

Duke Endowment.—By an indenture executed Dec. 11, 1924, by James B. Duke, the Duke endowment was established as a common-law trust "to make provision in some measure for the needs of mankind along physical, mental and spiritual lines." The fund allocates payments to educational institutions, including Duke university, Durham, N.C., and also distributes funds to help support hospitals, orphanages and the Methodist Church in rural areas. The amount distributed from Dec. 11, 1924, to Dec. 31, 1954, was \$14,822,345.75. The fund is supervised by a self-perpetuating board of 15 trustees. Officers (1955) included George G. Allen, chairman; Alex H. Sands, Jr., vice-chairman; Walter C. Parker, treasurer. Headquarters: Power building, Charlotte 1, N.C.

Elks, Benevolent and Protective Order of.—Founded in 1868, this service organization in 1955 had 1,170,000 members in its more than 1,700 lodges. Its purpose is to practise charity, justice, brotherly love and fidelity; to promote the welfare and enhance the happiness of its members; to quicken the spirit of American patriotism and cultivate good fellowship. During 1955 the organization donated funds for scholarships, infantile paralysis, cerebral palsy and other similar purposes. It emphasized its rehabilitation program in the Veterans Administration hospitals in the country, and in establishing fraternal centres for members of the armed forces. Publication: *The Elks Magazine*. Officers (1955): John L. Walker, Roanoke, Va., grand exalted ruler; L. A. Donaldson, Chicago, Ill., grand secretary; 2750 Lakeview Ave., Chicago 14, Ill., is the national headquarters.

Falk Foundation, Maurice and Laura.—This foundation was established in 1929 with the broad purpose of the advancement of human welfare. During 1955 grants totalling \$360,162.50 were made to finance research studies of economic problems affecting the domestic economy of the U.S., and to further the efforts of colleges and universities to prepare their students for citizen participation in politics. An allotment of \$100,000 was made to the Brookings Institution in support of a research study of the impact of union policies upon industrial management. Grants outside the foundation's major fields of interest included an allotment of \$40,000 to the Child Guidance Center of Pittsburgh. Funds as of Dec. 31, 1954, were \$14,200,792.75. Officers (1955) included: Leon Falk, Jr., chairman; Eugene B. Strassburger, secretary; J. Steele Gow, executive director. Headquarters: Farmers Bank building, Pittsburgh 22, Pa.

Ford Foundation.—The Ford foundation was founded in 1936 to receive and administer funds for scientific, educational and charitable purposes, all for the public welfare. During the fiscal year ended Sept. 30, 1955, it approved grants totalling \$49,438,558 in support of activities devoted

toward advancement of world peace and economic well-being, strengthening freedom, democracy and education, and increasing knowledge of human behaviour. The total assets of the foundation as of Sept. 30, 1954, amounted to \$493,213,842. On Dec. 12, 1955, the foundation announced grants to colleges, universities and hospitals throughout the nation totalling \$500,000,000, to be paid out during the following 18 months. Officers (1955) included: Henry Ford II, chairman; H. Rowan Gaither, Jr., president; Joseph M. McDaniel, Jr., secretary; and Ernest J. Perry, acting treasurer. Office: 477 Madison Ave., New York 22, N.Y.

Franklin Institute of the State of Pennsylvania.—This nonprofit institution was founded in 1824 for promotion of the mechanic arts. It devotes itself to interpreting science for nontechnical persons and to research for the benefit of industry and government. Activities include maintenance of the Benjamin Franklin memorial, a museum of science and industry, including Fels planetarium; a technical library of more than 250,000 volumes; lectures and exhibits on a wide variety of subjects; honour awards for distinguished achievements in science and technology; publication of the *Journal of the Franklin Institute*; the Franklin Institute Laboratories for Research and Development; the Bartol Research foundation; and the Biochemical Research foundation. In 1955 the institute conducted laboratories for research and development with divisions of mechanical engineering, electrical engineering, solid state physics, and chemistry and physics. Income is derived from dues of 6,923 members, museum and planetarium admissions, bequests and gifts, and industrial sponsorship of research and exhibits. Officers (1955): S. Wyman Rolph, president; Henry B. Allen, executive vice-president and secretary. Headquarters: Benjamin Franklin parkway at 20th St., Philadelphia 3, Pa.

Freemasonry.—Said to be the oldest and largest fraternal organization in the world, the Masonic fraternity is nonsectarian and nonpolitical and has no benefit or insurance provisions. Its purpose is the moral and spiritual elevation of its members and, through them, of mankind. Since the 18th century its lodges have been joined together in grand lodges, mostly on a territorial basis, each grand lodge being independent. Masonic organizations based on lodge membership include the Royal Arch, the Knights Templar and the Scottish Rite. There are 49 grand lodges in the U.S., three in the British Isles, one each in Canada and Australia. There are many lodges in other parts of the world, except in the totalitarian countries. Masonic membership in the U.S. in 1955 was 3,965,000 in 15,687 lodges; world membership was in excess of 5,000,000. Publications: annual transactions by all grand lodges and many of the related organizations; weekly, monthly and quarterly periodicals by some organizations and individuals.

Future Farmers of America.—Founded Nov. 20, 1928, this is a national organization of boys studying vocational agriculture in public secondary schools under the provisions of the national vocational education acts. The chief of the agricultural education service of the U.S. office of education is chairman of an adult national advisory council. The purpose of the Future Farmers is to develop agricultural leadership, co-operation and citizenship. Membership in 1955 was more than 371,000. Publications: *National Future Farmer*, quarterly, and various pamphlets. Officers (1955) included: William D. Gunter, national president, and Philip Brouillette, student secretary. Headquarters: U.S. Department of Health, Education and Welfare, Office of Education, Washington 25, D.C.

Girl Scouts of the United States of America.—The purpose of this organization, founded in 1912 by Juliette Low, is "to help girls realize the ideals of womanhood as a preparation for their responsibilities in the home and as active citizens in the community and in the world." In 1955 the 33rd National Girl Scout convention was held Nov. 1-4, in San Francisco, Calif. On June 30, 1955, 2,580,543 girls and adults, including brownie, intermediate and senior scouts, were members. Publications: *Girl Scout Leader*; *American Girl*; and various handbooks. Officers (1955): Mrs. Roy F. Layton, president; Mrs. Charles H. Ridder, secretary; Dorcas Campbell, treasurer. Headquarters: 155 E. 44th St., New York 17, N.Y.

Grange, National.—This farmers' organization, founded in 1867, is said to be the largest farm fraternity in the world. Representing the voice and influence of farmers in all segments of the national economy, the organization sought in its 1955 program to advance legislation on local, state, and national levels. Membership in 1955 totalled approximately 900,000 in 8,000 local units. Publication: *The National Grange Monthly*. Officers (1955): Herschel D. Newsom, master; Harry A. Caton, secretary. Headquarters: 744 Jackson Pl. N.W., Washington 6, D.C.

International College of Surgeons.—This organization was founded in 1935 to create a common bond among the surgeons of all nations and to promote the highest standards in surgery throughout the world without regard to nationality, creed or colour. In 1955, the 20th anniversary meeting was held in Geneva, Switz., May 23-26; and the 20th annual assembly of the U.S.-Canadian section was held in Philadelphia, Pa., Sept. 12-15. Membership was about 11,000. Publication: *The Journal of the International College of Surgeons*. Officers (1955) included: Rudolph Nissen (Switzerland), president; Carlos Gama (Brazil), president-elect; Max Thorck, international secretary general. Headquarters: 1516 Lake Shore Drive, Chicago 10, Ill.

Jewish Welfare Board, National.—Founded in 1917, this agency is authorized by the U.S. government to serve the religious, welfare and morale needs of Jews in the U.S. armed forces at home and abroad and in Veterans administration hospitals. In 1955 it had 241 community armed services committees. It recruited and served 344 full-time and part-time Jewish chaplains, and represented the U.S. Jewish community in the United Service organizations, on whose behalf it operated 30 clubs and area operations. Since 1921 it had also been the national association of Jewish Community centres and Young Men's and Young Women's Hebrew associations. Its 1955 membership included 348 centres with 552,000 members. Officers (1955) included: Charles Aaron, president; Frank L. Weil, honorary president; S. D. Gershovitz, executive vice-president. Headquarters: 145 E. 32nd St., New York 16, N.Y.

John Simon Guggenheim Memorial Foundation.—Founded in 1925, the foundation "offers Fellowships, to further the development of scholars and artists by assisting them to engage in research in any field of knowledge and artistic creation in any of the fine arts including music, under the

freest possible conditions." Fellowships are offered to citizens of the United States of America, all other American republics, the Republic of the Philippines, Canada and of the British Caribbean. Endowment (1955): \$43,519,000. Officers (1955): Mrs. Simon Guggenheim, president; Henry Allen Moe, secretary. Headquarters: 551 Fifth Ave., New York 17, N.Y.

Kellogg Foundation.—The W. K. Kellogg foundation was established in 1930 to promote the health, education and welfare of mankind, principally of children and youth without regard to race, sex, creed or nationality. It functions through the divisions of agriculture, dentistry, education, medicine and public health, hospitals, nursing and the international division. It is administered by a board of nine trustees, and its assets totalled \$124,257,200 in 1955. Officers (1955): Emory W. Morris, president; Orville L. DeBolt, treasurer; Leonard L. White, secretary. Headquarters: 250 Champion St., Battle Creek, Mich.

Kiwanis International.—Founded Jan. 21, 1915, in Detroit, Mich., this service organization operates through community Kiwanis clubs, comprised of business and professional men. During 1955 it sponsored with the U.S. Air Force the seventh annual National Kids' day; served as coordinating agency for first annual observance of "Farm City Week"; sponsored programs aimed at increasing religious interest; helped underprivileged children; and promoted agricultural and conservation projects; and vocational guidance programs. Membership in 1955 included more than 241,000 in more than 4,000 clubs of the U.S., Canada, Alaska, Hawaii and the Yukon territory. Publications: *Kiwanis Magazine* and *The Keynote*, official organ of the Kiwanis-sponsored Key clubs for outstanding high school youths. Officers (1955-56) included: J. A. Raney, president; O. E. Peterson, secretary; Reed C. Culp, treasurer. Headquarters: 520 N. Michigan Ave., Chicago 11, Ill.

Knights of Columbus.—This organization of Catholic men was founded in 1882 for the mutual help of its members. Later its purposes were broadened to include the conduct of educational, charitable, religious, social and relief work. Its program of advertising the facts concerning the Catholic religion in newspapers and magazines, begun in 1948, was being continued during 1955, resulting in 1,876,837 inquiries concerning the Catholic religion and the enrolment of 188,971 persons for instruction in the Catholic religion. Also its work of microfilming historic documents at the Vatican library for deposit at St. Louis university (Mo.), where they would be available for study by scientists and scholars, was progressing. Membership in 1955 was 937,217. Publication: *Columbia*, a monthly. Luke E. Hart was supreme knight. Headquarters: Columbus Plaza, New Haven, Conn.

League of Women Voters of the United States.—Founded in 1920, to promote informed and active participation of citizens in government, the membership in 1955 was 127,000 in 985 local leagues in 48 states, the District of Columbia, Alaska and Hawaii. In 1955 the league held discussions and published material on measures concerning support of U.S. trade policies, and development of the relationship between individual liberty and the public interest. The organization is not endowed. Publications: *The National Voter*, newsletter issued 16 times a year; and *Report from the Hill*, issued monthly during sessions of congress. Officers (1955) included: Mrs. John G. Lee, president; Mrs. W. J. Blanchard, secretary; Mrs. E. Boyne, treasurer. Headquarters: 1026 17th St. N.W., Washington 6, D.C.

Lions Clubs, International Association of.—The purpose of this organization, founded in 1917, is "to recognize community needs and develop means of meeting them, either through the clubs' own efforts or in co-operation with other agencies." In 1955 Lions clubs completed more than 161,000 activities for the betterment of communities, states and nations. These activities included projects in agriculture, education, and health and welfare. In 1955 there were more than 11,000 Lions clubs in 58 countries. Membership in 1955 was more than 519,000. Publication: *The Lion*, monthly. Officers (1955) included: Monroe L. Nute, president; R. Roy Keaton, director general. Headquarters: 209 N. Michigan Ave., Chicago 1, Ill.

Milbank Memorial Fund.—A membership corporation under the laws of the state of New York, this organization was founded in 1905 to improve the physical, mental and moral condition of humanity and generally to advance charitable and benevolent objects. In 1955 the fund appropriated funds to support activities and projects in the field of public health and medicine. Total funds (Dec. 31, 1954) amounted to \$14,347,065.76. Publications: *Milbank Memorial Fund Quarterly*; *Annual Report*. Officers (1955): Samuel R. Milbank, president; Frank G. Boudreau, executive director. Headquarters: 40 Wall St., New York 5, N.Y.

Moose, Loyal Order of.—Founded in 1888, the purpose of this organization is "to unite in the bonds of fraternity, benevolence, and charity all acceptable . . . persons of good character; to educate and improve their members . . . to encourage tolerance of every kind . . . and to serve aged members and their wives. . ." In 1955 the organization continued operations of its institutions at Mooseheart, Ill. (caring for children who had lost one or both parents), and Moosehaven at Orange City, Fla. (for dependent elderly persons). Membership in 1955 numbered 1,070,073. Publications: *Moose Magazine*; *Moose Docket*. Officers (1955): Paul P. Schmitz, director general; George Eubank, supreme secretary. Headquarters: Mooseheart, Ill.

National Academy of Sciences-National Research Council.—Founded in 1863, by act of congress, the academy's purpose is to advise the government on any subject of science or technology; stimulate research in science and its application to national welfare; and promote co-operation in research in the U.S. and internationally. During 1955 it held its 92nd annual meeting in Washington, D.C., April 25-27; undertook studies of the effects of atomic energy radiation on life; and planned a new study of highway construction. Membership in 1955 was 554; there were 256 members of the National Research council (founded 1916). Publications: *Proceedings of the National Academy of Sciences*; *News Report*; periodicals; numbered series of technical publications reviewing research. It is endowed by the Carnegie Corporation of New York. Detlev W. Bronk was president of the academy in 1955, and William J. Robbins was treasurer. Headquarters: 2101 Constitution Ave. N.W., Washington 25, D.C.

National Association for the Advancement of Colored People.—Founded

in 1909, this organization directed its 1955 activities toward implementing the U.S. supreme court decisions banning segregation of races in public schools; abolishing segregation in private and public housing; and ending terrorist acts against Negroes who attempt to register or vote. Membership in 1955 was approximately 250,000. Publications: *Crisis*, a monthly magazine. Officers (1955) included: Arthur B. Spingarn, president; Roy Wilkins, executive secretary. Headquarters: 20 W. 40th St., New York 18, N.Y.

National Association of Manufacturers.—The N.A.M. was founded in 1895 to promote the industrial interests of the U.S., foster domestic and foreign commerce, improve employer-employee relations, protect individual liberty and the rights of employer and employee and support legislation in furtherance of those principles. Its activities in 1955 concentrated on creation of an atmosphere which inspires public confidence and faith in the future. Membership in 1955 was approximately 20,000. Publications: *Memo to Members*, biweekly; *The Washington Bulletin*, weekly; *Program Notes*, monthly; *Economic Chart Service*, monthly; and others. Officers (1955) included: Harold C. McClellan, chairman of the board; Henry G. Riter, III, president; Thomas M. Brennan, secretary. Headquarters: 2 E. 48th St., New York 17, N.Y.

National Association of State Libraries.—This association was founded in 1889 "to develop and increase the usefulness and efficiency of the state libraries and other agencies performing library functions at the state level." Its 1955 membership included 225 institutional, individual and associate members. Publications include check lists of collected public documents, legislative journals, session laws and statutes and the *Newsletter*, quarterly. Officers (1955) included: Walter T. Brahm, state librarian, Columbus, O., president; Helene H. Rogers, Springfield, Ill., secretary-treasurer. Headquarters: Illinois State Library, Springfield, Ill.

National Council of the Churches of Christ in the United States of America.—The purpose of this non-profit organization, founded in 1950, is to express practically the unity of spirit and purpose which Christian people have because of their common loyalty to Christ. It serves as a co-operative instrument of 30 nationwide Protestant and Eastern Orthodox communions, whose aggregate membership in 1955 was about 35,500,000. In 1955 the organization furthered its teachings via home and foreign missions, radio, television, educational films and the press. Publications include: *The National Council Outlook*; *The Church Woman*; *International Journal of Religious Education*. The budget for 1955 was more than \$9,000,000. Officers included: Eugene C. Blake, president; Charles E. Wilson, treasurer; Roy G. Ross, general secretary. Headquarters: 297 Fourth Ave., New York 10, N.Y.

National Education Association of the United States.—This organization was founded in 1857 "to elevate the character and advance the interests of the teaching profession and to promote the cause of education throughout the country." In 1955 the association continued construction of a new \$5,000,000 education centre in Washington, D.C., and held major meetings in 32 states. In 1955 the membership was 600,000; membership of affiliated state associations was more than 1,000,000. Publications include the *NEA News*; *NEA Journal*; and a *Research Bulletin*. Officers (1955-56) included: John L. Buford, president; Gertrude E. McComb, treasurer; William G. Carr, executive secretary. Headquarters: 1201 16th St. N.W., Washington 6, D.C.

National Foundation for Infantile Paralysis, Inc.—Founded in 1938 by Franklin D. Roosevelt for the purpose of combating infantile paralysis (polio), the organization does this by treating patients, extending fellowships and scholarships to train medical personnel in polio treatment methods and financing research into prevention and treatment. In 1955 there were 3,100 chapters in the U.S., its territories and administered areas. During 1955, the foundation continued grants-in-aid to 14 regional respirator centres in hospitals. It also proceeded with its plans to provide enough vaccine to inoculate all children in the first and second grades of school. The organization's monthly publication is *National Foundation News*. Support is derived by voluntary contributions to the annual March of Dimes in January. Officers (1955): Basil O'Connor, president; Raymond H. Barrows, executive director. Headquarters: 120 Broadway, New York 5, N.Y.

National Recreation Association.—Founded in 1906 to "help assure every child in America a place to play in safety and every person, young and old, an opportunity to find the best and most satisfying use of his expanding leisure time," this association in 1955 had 1,300 affiliate (agency) members, 2,784 associate (individual) members and 16,000 contributing members. Publication: *Recreation* magazine. Officers (1955): Otto T. Mallory, chairman of the board; Joseph Prendergast, executive director. Headquarters: 8 W. Eighth St., New York 11, N.Y.

National Science Foundation.—The National Science foundation is an independent agency of the federal government, established by congress in May, 1950, "to promote the progress of science; to advance the national health, prosperity, and welfare; to secure the national defense; and for other purposes." The foundation consists of the National Science board and a director. Its principal activities are the development of national science policy; the support of basic research; and the furtherance of education in the sciences through the award of graduate fellowships and by other means. Chester I. Barnard was chairman of the board in 1955 and Alan T. Waterman was director.

During 1955 the foundation awarded 558 grants, or a total of \$7,857,395, in the biological, mathematical, medical, physical and engineering sciences. The foundation awarded a total of 785 fellowships for the academic year 1955-56, including 715 predoctoral awards and 70 postdoctoral awards. During 1955 the foundation continued a comprehensive survey of science in the U.S., which included research and development in industry; research and development at nonprofit organizations; and studies of scientific manpower. Headquarters: 1520 H St. N.W., Washington 25, D.C.

National Society for Crippled Children and Adults, Inc.—Founded in 1921, this organization is also called the Easter Seal society. Its purpose is to help crippled children and adults by providing care and treatment services; to conduct a public educational program; and to encourage research into causes, prevention and treatment of crippling conditions. In 1955 the society maintained hundreds of facilities and programs, in-

cluding diagnostic clinics, rehabilitation centres, employment programs and outpatient treatment-training centres. In 1955 there were state member societies in 52 U.S. states and territories, including District of Columbia, Hawaii, Alaska and Puerto Rico. Publications: *Crippled Child Magazine*; *Bulletin of the National Society*; *Bulletin on Current Literature*. Funds derived from the 1955 annual Easter Seal campaign totalled \$8,441,500. Officers (1955) included: Edgar Kobak, president; Lawrence J. Linck, secretary. Headquarters: 11 S. LaSalle St., Chicago 3, Ill.

National Temperance League, Inc.—This federation of state temperance organizations was formed by the merger in 1950 of the Temperance League of America and the National Temperance Movement, Inc. In 1955 the league sought action by congress to ban liquor advertising in interstate commerce, and sponsored highway safety, particularly with respect to national and state laws to minimize deaths and injuries caused by drinking drivers. The official publication is the *American Issue*. Officers (1955) included: president, Duke K. McCall; secretary, the Rev. James Swedenburg. Headquarters: 131 Independence Ave. S.E., Washington 3, D.C.

Parents and Teachers, National Congress of.—This organization, founded in 1897 as the National Congress of Mothers, had in 1955 a membership of 9,409,282 parents, teachers and other citizens organized in 40,322 local associations. Its purpose is to promote the welfare of children; raise the standards of home life; secure laws for care and protection of children and youth; bring the home and school into closer relationship; and develop plans for joint action along these lines by educators and the general public. The year 1955 saw the national headquarters building in Chicago, Ill., dedicated; special promotion of high school P.T.A.'s; and an extended publications program (pamphlets, etc.). Publications include: the *National Parent Teacher*; the *P.T.A. Magazine*; *National Congress Bulletin*; and *National Congress Proceedings*, annual. Officers (1955) included: Mrs. Rollin Brown, national president; Mrs. L. W. Alston, national secretary. National Headquarters: 700 N. Rush St., Chicago 11, Ill.

Research Libraries, Association of.—Founded in 1931, this association of 45 institutions seeks "by co-operative effort to develop and increase the resources and usefulness of the research collections in American libraries." In 1955 it sponsored a co-operative plan for the acquisition of foreign newspapers in a national pool, and promoted a study and conference on research library costs. Publications include *Problems and Prospects of the Research Libraries*, edited by E. E. Williams; *Doctoral Dissertations accepted by American Universities*, an annual. R. A. Miller was executive secretary in 1955, and headquarters were at the Indiana University library, Bloomington, Ind.

Rockefeller Foundation.—Founded in 1913 "to promote the well-being of mankind throughout the world," the foundation during 1955 made grants to institutions or agencies such as universities, research institutes or governmental agencies. Its program for the advancement and application of knowledge to human interest was concentrated in certain specific fields of medical education and public health, biological and medical research, agriculture, social sciences, and humanities. The 21 trustees are the 21 members of the corporation. Assets, Dec. 31, 1954, totalled \$161,044,933 (book value). Officers (1955): Dean Rusk, president; Edward Robinson, treasurer; Flora M. Rhind, secretary. Headquarters: 49 W. 49th St., New York 20, N.Y.

Rotary International.—Founded Feb. 23, 1905, this organization sponsors a program to encourage and foster the "ideal of service." By 1955, 711 Rotary fellowships for graduate study for one year in foreign countries, averaging \$2,500 each, had been awarded to students from 57 countries. There were 8,900 Rotary clubs with a membership of 420,000 business and professional executives in 92 countries and geographical regions. In 1955, Rotary International observed its golden anniversary. The 1956 convention was to be held in Philadelphia, Pa., June 3-7. Publications: the *Rotarian* (English) and *Revista Rotaria* (Spanish), monthly magazine; numerous pamphlets. Officers (1955) included: A. Z. Baker, president; George R. Means, secretary. Headquarters: 1600 Ridge Ave., Evanston, Ill.

Russell Sage Foundation.—This foundation was established in 1907 by Mrs. Russell Sage for "the improvement of social and living conditions in the U.S." Its 1955 program consisted of varied research and consultation projects, designed to advance the use of the social sciences in the fields of health, education, philanthropy, professions and professional training, the child and the family and intergroup and cultural relations. Publications of 1955 included *Studying Your Community*, by R. L. Warren; and *Health, Culture, and Community*, edited by B. D. Paul. Assets of the foundation, Sept. 30, 1955, totalled \$21,000,000. Officers (1955): Donald Young, president; E. W. Debevoise, chairman of the board; Dave H. Morris, Jr., treasurer; Ralph G. Hurlin, secretary. Headquarters: 505 Park Ave., New York 22, N.Y.

Seeing Eye, Inc.—A national philanthropy founded in 1929 and supported through annual memberships, public contributions and bequests. The society's purposes include securing and training dogs to guide blind persons, teaching instructors the technique of training the guide dogs and training the blind in proper use of their guide dogs. During 1955, 161 blind persons were provided with dog guides. Membership was about 20,000; 3,180 persons had received Seeing Eye dogs since the organization's inception. Publications: *The Seeing Eye Guide*, published quarterly for the members of The Seeing Eye, and printed booklets. Officers (1955): Henry A. Colgate, president; James Carey, treasurer; Dorothy S. Atkinson, secretary. Headquarters: Morristown, N.J.

Sloan Foundation, Inc., Alfred P.—Founded in 1934, the foundation is a nonprofit corporation established for educational, scientific and related purposes. The foundation's grants during 1955 went largely to established projects in medicine, especially cancer and ophthalmological research, scholarship and fellowship projects in leading colleges and universities, and popular educational projects. Major activity of 1955 was the allocation of \$5,000,000 for the promotion of research in pure science in U.S. research institutions and universities. For the first half of the year these grants were made at an annual rate of more than \$2,500,000. The market value of the foundation's investments as of May 1, 1955, was approximately \$60,960,000. Officers (1955): Alfred P. Sloan, Jr., president; Raymond P. Sloan, vice-president; James F. Kenney, secretary and treasurer; Arnold J. Zurcher, vice-president and executive director. Head-

quarters: 30 Rockefeller Plaza, New York 20, N.Y.

Sodality of Our Lady.—This international Catholic body was founded in 1563 to foster devotion to Mary, the Mother of God. During 1955 seven weeks of leadership training were given in seven cities of the U.S. A total of 12,902 persons attended. U.S. membership in 1955 comprised 18,019 affiliated units. The seventeenth annual meeting of Diocesan Sodality directors was held in St. Louis, Mo. Publications include *The Queen's Work*, *Action Now!*, *Junior Sodalist* and books and pamphlets. Officers included a number of priests of the Jesuit order. U.S. headquarters: 3115 S. Grand Blvd., St. Louis 18, Mo.

Twentieth Century Fund.—Founded in 1919 by Edward A. Filene, this is a nonprofit, nonpartisan foundation for research and public education on current economic problems. In 1955 the fund completed studies on farm problems; U.S. needs and resources; economic development; economic needs of older people; and U.S. imports, etc. Research projects in progress included studies of recent agricultural policies of the U.S.; the influence of military considerations on national policy; distribution costs and methods; antitrust policies and enforcement; the effects of technological changes on the economy; and a survey of economic, social and political conditions in tropical Africa. During 1955 the fund published *Newsletters* and *Newsbriefs* to keep its activities before the public. Total assets, Dec. 31, 1954: \$12,134,162. Officers (1955): A. A. Berle, Jr., chairman of the board; Francis Biddle, vice chairman of the board; J. Frederic Dewhurst, executive director; H. C. Sonne, treasurer. Headquarters: 330 W. 42nd St., New York 36, N.Y.

United States Junior Chamber of Commerce.—The purpose of this organization, founded in 1920, is to help make every community (and the country) a better place in which to live through the promotion of constructive civic projects, and to help develop civic leadership. In 1955 the chamber sponsored projects such as traffic safety, civil defense and disaster relief, sports, and raising funds for the U.S. Olympic team, and was active in such fields as agriculture, public health, fire prevention, voter registration, international relations and youth welfare. Membership in 1955 was 160,421 in 2,500 chapters. Publications: *Future and Action*, both monthly. Officers (1955) included: Hugh F. McKenna, president; Charles W. Johnson, treasurer. Headquarters: 21st St. and Jaycee Blvd., Tulsa, Okla.

Woman's Christian Temperance Union, National.—The W.C.T.U., founded in 1874, is an organization of Christian women banded together to disseminate information as to what alcohol is and what it does, and the impact which the use of alcoholic beverages has upon the social and economic life of the nation. Membership, about 400,000; publications include the *Union Signal*, weekly, and the *Young Crusader*, monthly for children. Officers (1955): Mrs. Glenn G. Hays, president, Mrs. H. E. Mielke, corresponding secretary, Mrs. H. F. Powell, treasurer. Headquarters: 1730 Chicago Ave., Evanston, Ill.

Women's Clubs, General Federation of.—Founded in 1890, this organization aims at uniting women's clubs throughout the world to promote education, philanthropy, public welfare, moral values, civics and fine arts. During 1955 emphasis was placed upon a special project of removing crime, sex and horror comic books from newsstands. Membership in 1955 included 867,566 individual paying members, with a total in affiliated organizations of about 11,000,000 in the U.S. and 54 other countries. Publication: *General Federation Clubwoman*, monthly. Officers (1955): Mrs. Theodore S. Chapman, president; Mrs. R. I. C. Prout, first vice-president; Chloe Gifford, second vice-president. Headquarters: 1734 N St., N.W., Washington 7, D.C.

World Council of Churches.—Founded in 1948, this association's purpose, "through ecumenical fellowship and work and study programs, is to promote better understanding between churches and encourage them in their will toward Christian unity." The program of the Council is co-ordinated through three main divisions: studies, ecumenical action, and inter-church aid and service to refugees. The council maintains contact with the United Nations through the Commission of churches on international affairs. The year 1955 saw the inauguration of a three-year study dealing with the church's responsibility in world areas of rapid social change. Member churches, in 1955, totalled 164 in 46 countries, representing more than 160,000,000 persons. Publications: *Ecumenical Review* (quarterly); *Ecumenical Press Service* (weekly); *Ecumenical Courier* (bimonthly). In 1955 the basic budget was \$441,000. Council activities are guided by a central committee which met in 1955 in Davos, Switz. Headquarters: 17 Route de Malagnou, Geneva, Switz.; U.S. office: 156 Fifth Ave., New York, N.Y., Samuel McCrea Cavert, executive secretary.

Young Men's Christian Association.—Founded in London, Eng., in 1844, this is a world-wide fellowship seeking to improve the spiritual, social, recreational and physical lives of young people. During 1954 (latest data available in 1955) there were 1,802 Y.M.C.A.'s operating in cities and rural areas, with memberships of 3,086,137. About 171,229 clubs, classes, teams, special-interest groups and councils met regularly with programs emphasizing physical, educational, social and religious features, plus emphasis on citizenship and world affairs. Among high school youth, 10,018 Hi-Y clubs for boys and 4,816 Tri-Hi-Y clubs for girls were functioning. Publications included *National Council Bulletin* and *YMCA Year Book* for 1955. Endowments totalled \$57,695,200. Officers (1955): James C. Donnell II, president; Jay A. Urice, general secretary. Headquarters: 291 Broadway, New York 7, N.Y.

Young Women's Christian Association of the United States of America.—This organization was founded in England in 1855 and in the U.S. in 1858 to build a fellowship of women and girls devoted to the pursuit of Christian ideals in personal and social living. During 1955 more than 3,000,000 women and girls participated in its activities in the United States. Publications: *The Bookshelf* and *YWCA Magazine*. Officers (1955) included: Miss Lilace R. Barnes, president; Mrs. F. Beardsley Foster, vice-president; Mrs. A. Hudson Sealy, secretary. Headquarters: 600 Lexington Ave., New York 22, N.Y.

Zonta International.—A service organization of executive women in business and the professions, founded in 1919, this organization encourages high ethical business and professional standards, the improvement of the legal, political, economic and professional status of women, and interna-

tional understanding through a world fellowship of executive women. Membership in 1955 included 325 clubs with approximately 11,500 members in the U.S. and 12 other countries. Publication: *Zontian* (magazine). Officers (1955-56) included: Dorothea Radusch, Minneapolis, Minn., president; Ellen Fireoved, Chicago, Ill., executive secretary. Headquarters: 59 E. Van Buren St., Chicago 5, Ill.

Sociology. The year 1955 saw nothing startlingly new in sociology and specialties closely related to it, but there were several minor developments of interest.

The lack of new vogues perhaps reflected the fact that readjustments, already evident the previous year, were still continuing. Cancellation or termination of research contracts by the armed services sharply limited the amount of large-scale team research, simultaneously releasing a considerable number of younger men for regular academic work.

Not only was there a lack of new vogues, but a number of old vogues continued to wane. For example, the psychoanalytic influence, once so popular in sociology, social psychology and social and cultural anthropology, affected far fewer specialists in these fields with the possible exception of the last. Even here the earlier excesses of the child-training enthusiasts and the "national character" impressionists had begun to encounter somewhat more outspoken criticism than had hitherto been evident. Social psychology continued to be popular in the United States, and in Germany the *Cologne Journal of Sociology* added *and Social Psychology* to its title, but it was nevertheless clear that more resistance to all-inclusive sovereignty was being encountered. Structural-functional sociology was still much advocated, but it had begun to become plain that structure and function had long been sociological household recipes, so to speak, under less grandiose names. Small group studies, as in the half-dozen years previous, had many aggressive practitioners; nevertheless, there were noticeably fewer band-wagon jumpers.

One exception to the decline of old vogues should be noted, although it was in a certain sense an index of the decline of another vogue not yet mentioned; this was the transfer of the journal *Sociometry* to the American Sociological society and the prompt addition of a subtitle, *a Journal of Research in Social Psychology*. Sociometry apparently waned whereas social psychology waxed. Inspection of the list of editors and subeditors showed, however, that no new names appeared; all those responsible for the new journal had long been identified with social psychology, and some of them had been consistent advocates of limited claims. Sociometry, moreover, retained its distinctive psychotherapeutic emphasis in other publications not transferred, although it was probably true that it no longer attracted as much attention even in that field as it had ten years before.

The absence of new and the decline of old vogues was accompanied, as might perhaps have been expected, by a lack of response to challenging issues. For example, although in 1952 and for a short time thereafter there had been some signs of strong reaction to A. H. Hobbs's forthright attacks on sociologists for their real or supposed lack of objectivity and scientific probity, by 1955 these signs had almost wholly disappeared. The attacks, in other words, remained unanswered.

Another issue, repeatedly although not sensationally raised, was the failure of sociologists, in the United States in particular, to make effective use of the data of history. In spite of the widespread public interest in A. J. Toynbee's *A Study of History*, for instance, few sociologists took the trouble, so it seemed, to acquaint themselves with his work, much less to conduct similar investigations. W. J. Cahnmann had tried for several years and especially in 1955 to get a place on the annual program of the American Sociological society for a group of sociologists interested in the interrelations of sociology and history,

but without success.

A hopeful note was introduced, however, by the successful continuation of *Sociological Abstracts*, a journal that for a time had seemed unlikely to survive; it reached its third volume in 1955. The wide range of articles and books abstracted might eventually, it was thought, broaden the horizons of its readers. The same was true of *Current Sociology*, a bibliographical journal published under the auspices of the United Nations Educational, Scientific and Cultural organization, likewise in its third year. Further, the attention of sociologists was called to the *Journal of Social History*, beginning publication in Amsterdam in 1955, and having sociologists among the sponsoring board and the contributors to the first number.

Still another hopeful development was the new policy of the Ford foundation with regard to research grants in the "behavioural sciences"—sociology, social psychology, social and cultural anthropology. Most Ford grants, in earlier years, had been for large-scale team research projects. In 1955 requests were solicited for grants-in-aid of projects of any kind; the researcher to whom the grant was made was given sole authority for the expenditure of the amount (\$4,500) in any way he saw fit. This meant that many researchers previously reluctant to apply for team research projects now felt that individual enterprise had some likelihood of recognition.

A new and apparently worthwhile trend also appeared in conjunction with the Society for the Study of Social Problems. Doubts had previously been apparent about the policy of the society and of its publication, *Social Problems*, for it was felt that a certain lack of scientific detachment and impartiality prevailed. In 1955, however, the society announced a competition for the Helen DeRoy award, to be granted for the best paper on some social problem, this paper to be published in the society's journal. The contest judges were about as free from commitments to favourite causes as any persons having any interest in social matters were likely to be, and the award, divided because of their equal merit, was granted to two papers that were models of objectivity. One, on the sociology of work groups, was by Robert Dubin; the other, by Melvin Seeman, was on the creativity of marginal personalities. Many of the other papers submitted in the competition manifested similar objectivity; it was evident that the study of social problems was reaching a new and higher scientific level.

A meeting held at Fisk university, Nashville, Tenn., early in April 1955 was likewise strikingly objective. The meeting was for the dedication of the Robert E. Park Memorial Social Science building at Fisk, and the occasion coincided with the lively popular interest in Negro-white relations stimulated by the desegregation decision of the U.S. supreme court a short time before. Under the guidance of Charles S. Johnson, president of Fisk, a number of Negro and white speakers representing the social sciences participated in the dedication addresses, and the tone of their remarks was almost uniformly sober and restrained.

Sociology in countries other than the United States continued to forge ahead, but at uneven rates. In Israel the work of S. N. Eisenstadt, Uriel G. Foa and Louis H. Guttman was outstanding. Turkey showed strong interest, setting up plans for an Institute of Sociological Research at the University of Ankara and endeavouring to secure lecturers from abroad to supplement regular staff. In France sociological activity was everywhere evident, but was somewhat dominated by schools of thought and too diffuse. The sheer volume of publication, however, was impressive. Germany accomplished a good deal during the year, but continued to be handicapped by the dearth of properly trained personnel and the curious ignoring of much of the significant work done in the 1920s, the "classic" period of German

sociology. Britain continued the advances evident earlier; there was still, however, a notable lack of recognition of sociology in other than the red-brick universities. Japan was very active, with a strong group of younger men who launched Japanese researches independently of hampering traditions and American occupation influence alike; Kunio Odaka was one of the most vigorous. Norway, Sweden and Denmark made notable progress; the latter country brought out a new periodical, *Acta Sociologica*, the first issue of which was devoted to the work of Theodor Geiger of the University of Aarhus. The one exception to the generally hopeful picture was Italy, where except for Franco Ferrarotti and his associates little was being done that represented any marked departure from the older and basically sterile period immediately prior to World War II.

Popular interest in sociology in the United States was enormously stimulated by a special feature in *Time* magazine, devoted to the work of David Riesman, a University of Chicago sociologist whose book, *The Lonely Crowd*, was a stimulating analysis of changes in American character. His types of "other-directed," "inner-directed" and "autonomous" personalities were refreshing departures from the orthodox Freudian models that had previously monopolized the field. In a little-known book, edited by John Doby, *Introduction to Social Research*, John C. McKinney of Michigan State university, East Lansing, contributed the best analysis of the entire procedure of type construction to be found in English. Lacking the appeal of Riesman's book, it nevertheless provided a rationale for types of all kinds—of personality, social group, value system and so on—that Riesman's brilliant but impressionistic treatment did not include.

The 1955 annual meeting of the American Sociological society, under the presidency of Donald Young of the Russell Sage foundation, took place at Washington, D.C., in early September. At that time it was decided to hold the 1956 meeting in Detroit, Mich., again in early September. (H. BEC.)

Sodality of Our Lady: see SOCIETIES AND ASSOCIATIONS, U.S.

Softball. The Raybestos Cardinals of Stratford, Conn., were winners in the 1955 world tournament of the Amateur Softball association played at Clearwater, Fla. In giving the northeastern section of the United States the title for the first time since 1940 the victors captured six of their seven contests. The Clearwater (Fla.) Bombers, the defending champions, placed second in the final standing with a record of six won and

two lost. After dropping a 1-0 decision to Stratford, Clearwater came back to shut out the Connecticut club, 2-0, and force the competition into a play-off game. Howie Weiland held the Bombers to two hits in the play-off and doubled to drive in Nick Santo, who had tripled, to win his own game in the tenth inning.

Twenty-four teams competed in the third annual slow-pitch tournament at Pittsburgh, Pa., and Langs Pet Shop of Covington, Ky., came through as champion. The Covington team beat the Cincinnati (O.) Comets, 19-13, in a single play-off to take the crown.

The Orange Lionettes of Orange, Calif., behind the stellar pitching of Bertha Ragan, regained the women's world championship. The Lionettes went undefeated in five games in the annual tourney at Portland, Ore. Miss Ragan hurled four shut-outs and then beat the Phoenix (Ariz.) Ramblers, 4-1, in the final for the best pitching performance in the history of the title event. Carole Nelson of the Fresno (Calif.) Rockets was chosen as "Miss Softball of 1955." (T. V. H.)

Soil Conservation. Increases in land area treated for soil and water conservation and solution or partial solution of some of the more difficult and obscure soil problems were outstanding features of this world movement in 1955. It was estimated that during the year, in all countries, modern farming and grazing land practices designed to improve and safeguard soil resources and increase yields were applied on nearly 100,000,000 ac. of agricultural land not previously treated. The largest areas covered were in North America, parts of Africa and Australia, but considerable progress was made also in spreading conservation methods in several parts of South and Central America, in small countries bordering the Mediterranean and on the land of island nations such as the Philippines and Indonesia. Contouring, strip cropping, terracing, grazing-land improvement by use of better forage plants and controlled grazing and water diversion and storage facilities were the most widely adapted practices. Planting of trees on eroded land was an important activity in many parts of the world.

A few details of conservation accomplishments in various world regions are given in the following:

United States.—Major emphasis was given to speeding up the rate of application of complete conservation plans, including all needed practices, to the land of farms and ranches. This involved vigorous programs in all states, and in soil conservation districts and watershed protection areas within states, to inform the people of the advantages of such plans. It involved also intensive training by the soil conservation service of conservation technicians, especially in the field of engineering, in order to provide personnel required to assist farmers and ranchers and watershed groups in applying basic conservation plans and in preparing work plans for watersheds containing a large number of farms and municipalities.

Favourable results were apparent in fiscal-year reports from all parts of the country. There were 2,674 organized conservation districts covering approximately 1,485,000,000 ac. and including 4,884,490 farms and ranches. The work of planning and applying conservation measures to the land was in progress in all but the seven most newly organized districts. In addition, operations to apply water management and flood-control measures, in addition to soil conservation plans on farmland, were proceeding according to schedule in 59 pilot watershed areas, subwatersheds of 11 major watersheds and in 103 watershed protection projects established by local groups under authority of the Watershed Protection and Flood Prevention act of 1954.

CLOSE PLAY AT THIRD BASE in an exhibition softball game by girls' teams of Atlanta, Ga., in 1955

During the fiscal year, nearly 136,000 farmers and ranchers operating 42,000,000 ac. in soil conservation districts took the first steps toward complete conservation land use on their land. This made a cumulative total of 1,552,336 farmers and ranchers, operating 454,427,009 ac., who had adopted conservation plans and methods as a basis for season to season production. Of this number, 1,034,530 farmers using more than 286,500,000 ac. were working in an advanced stage of complete conservation; and 164,673 farmers had applied all measures needed for permanent conservation use of their soil and water resources.

There was wide public interest during the year in the watershed protection and flood prevention phase of the program. Given below are works accomplished in 1955 in 11 major watersheds and 58 small upstream pilot watershed projects, with technical assistance and cost-sharing by the soil conservation service of the U.S. department of agriculture:

Floodwater retarding structures	129
Stabilization and sediment control structures	1,044
Silt and debris basins	38
Outlet construction	12 mi.
Grassed waterways	165 mi.
Channel stabilization and improvement	211 mi.
Water diversion construction	67 mi.
Levees and dikes	12
Roadside erosion control	425 mi.
Revegetation with grasses and legumes, woody plants	27,798 ac.

The state legislatures moved during the year to authorize state and local agencies to assume their new responsibilities for initiating and carrying through with the watershed protection and flood prevention projects where they were needed. During 1955, 20 states passed new or amendatory legislation to further co-operation between state and local agencies and the U.S. department of agriculture in watershed activities. In all, 37 different laws were passed in the 20 states. This response of the states appeared to be a record for legislative action in a single year directed toward co-operation with the federal government in a soil and water conservation and development program.

Thousands of farmers and ranchers sought technical assistance in the engineering phases of soil and water conservation problems. This was largely because of drought and the need to make better use of water available for agriculture. In the normally humid states east of the Mississippi river, the spread of irrigation facilities for use in periods of dry weather was greater than ever before. The soil conservation service assisted more than 10,000 farmers with planning and installing sprinkler irrigation systems during the year.

Other water conservation and use practices newly applied on farms throughout the country during 1955 were:

86,574 ponds constructed
6,902 mi. of water diversion channels
45,806 mi. of terracing for runoff control
1,713,618 ac. benefited by improved irrigation water application
493,907 ac. levelled for new irrigation systems
1,553,562 ac. of wet land drained

The following practices involving crop production and revegetation methods were applied on farm and range land:

Contour farming	3,146,889 ac.
Cover cropping	4,506,673 ac.
Strip cropping	947,611 ac.
Tree planting	313,209 ac.
Seeding range and pasture	3,134,634 ac.
Wildlife area planting and improvement	525,051 ac.
Windbreak planting	1,224 mi.
Hedgerow planting	705,466 rods
Stubble mulching	4,199,916 ac.
Crop residue utilization for soil fertility	7,949,445 ac.

Europe.—Modern soil conservation methods were being introduced into the agriculture of most European countries. Even where there was no government-authorized program, scientists connected with agricultural colleges or other institutions were

making an effort to complete necessary land studies and adapt conservation practices to different land types.

In Poland, a level or gently undulating and well-watered country, surveys revealed that soil erosion was reaching serious proportions in loess soils, with formation of gullies and annual losses in the humus strata of the soil of lands used for crop production. Demonstration areas, established in the vicinity of Lublin, displayed contour strip cropping, waterways strengthened by a fascine fence and terraces formed by using the rotary plow with ridges planted to grasses. Several excellent publications on soil conservation methods were issued in Poland.

In Spain a Soil Conservation law was passed and an agency organized in the Ministerio de Agricultura to develop a program. Training of soil conservation technicians, surveys and practical demonstrations and information and education programs to acquaint the people with the needs and objectives of the work were launched simultaneously during the year. The secretary of agriculture of Spain visited the department of agriculture of the United States to study its soil and water conservation program for gradual adaptation in Spain.

In Greece the land improvement section of the ministry of agriculture, established in 1954, launched an over-all program including research, demonstrations and educational features similar to that of Spain. Very serious problems faced both countries because of large areas of severely eroded land.

Scientists of the department of soils, Agrochemical institute, Budapest, Hung., reported results of experiments and investigations to determine the effects of soil erosion on nutrients in different soils, with special reference to the root-zone horizon. Brown forest soil, steppe soil, Rendzina soil, clay soil and alluvial sand were studied. Under identical topographic and climatic conditions, the greatest losses in organic substances and total nitrogen are suffered by Hungarian steppe soils. The brown forest soils, especially the B horizon, were found to be most resistant to water erosion. In all instances, the changes in nutrient content caused by erosion manifested themselves in crop yields and the general development of vegetation. Plans were made to adapt crops and legume-grass pasture and hay production to farmland areas to increase humus content, prevent further erosion and leaching and increase field yields.

Mediterranean Areas.—The most pressing problems in North African and Asian countries bordering the Mediterranean sea were pointed out as follows by groups studying these areas: needed legislation to launch and support over-all soil and water conservation programs; immediate steps to protect good lands and forests; and afforestation on denuded hills. In Libya tree planting was started during the year, with demonstration plots to be used as nurseries to produce planting materials for reforestation and dune fixation. Work had been started to plant sand dunes to heavy growing grasses on a grid system with trees in the centre. The object was to reclaim dunelands for wheat growing.

Desert control measures were considered of paramount importance in these countries. Goat grazing control laws were passed in both Jordan and Lebanon. Water spreading was introduced in the Jordan desert, with the object of making use of cloudburst runoff. Two crops of hay a season, one ton per acre, were realized from use of this method.

Preliminary studies showed a serious water conservation problem in Egypt. It was determined that the country loses yearly in flood season, as drainage water and in the Sudd region, enough water to cultivate 10,000,000 ac. In Morocco, where outstanding vegetation studies had been completed, a start was made under the Morocco Forest fund to plant 14,900 ac. to fast-growing arid-land trees such as acacia and eucalyptus in combination with native cork oak, pines, junipers and cedars.

New Zealand.—The "aerial farming" device to control erosion, improve exhausted soils and deteriorating pastures in the hill country was proving successful. In five years 500,000 tons of phosphate, 1,000,000 lb. of clover and grass seed, 13,000,000 lb. of rodent poison and 1,000,000 lb. of fencing and supply materials had been dropped from aeroplanes for use by hill farmers. Top-dressing and oversowing of pastures from the air had doubled carrying capacity and controlled erosion in all grazing areas where controlled grazing was practised. Land capability surveys and conservation farm planning, as used in the United States, had been adopted by the New Zealand Soil Conservation and Rivers Control council for use in the 14 soil conservation reserves, all the demonstration and experimental farms and also in the 8 large catchment districts.

Australia.—A policy for protection of costly flood control dams and reservoirs was developed in New South Wales. The lands draining directly into reservoirs are placed under management of the state's soil conservation service, and this agency is responsible for control of erosion and siltation. Some of the practices essential to protection of such areas are revegetation of all land, fencing with rabbitproof fence and rabbit eradication, mechanical control works including stock-water ponds, silt traps, gully control structures, control of noxious weeds and provision and maintenance of access roads.

Large per acre yield increases were reported in New South Wales as the direct result of conservation farming.

Canada.—An excellent conservation program had been developed to protect the land and water resources of Ontario. Nineteen conservation authorities, based on watershed limits, had been organized and their land, water and vegetation resources surveyed in detail. Work of applying conservation plans had begun in all authorities which included 11,976 sq.mi. and 287 municipalities.

South America.—In Argentina progress during the year included development of a conservation plan for the central pampas, where erosion and soil depletion had reached serious proportions. Work was started to establish 2,470,000 ac. of shelter belts to combat wind erosion.

Soil and land capability surveys covering ten large areas had been completed and findings made available for conservation purposes.

In Peru, in the region of Cuzco, some old Inca terraces which had been overgrown with vegetation were being cleared and brought into use. Also, in the same region, an interesting high-altitude cropping system which had been developed locally over a period of years was proving successful; contour bands of valuable eucalyptus trees were planted and cultivated for maximum production, with strips of high-producing maize and barley between and below the trees.

These plantings were at altitudes of 11,000 ft. to 12,500 ft., and were of considerable interest to conservationists working in eroded Andean areas.

In Venezuela the department of soils of the ministry of agriculture had covered 2,965,200 ac. in its soil survey and land capability program. Both new lands and land long in farms were included in these land studies. At the same time findings of important experiments to determine soil absorption changes resulting from loss of organic matter from tropical soils were reported.

The results showed absorption decreases of 30% in soils low in organic matter.

Solar System: see ASTRONOMY.

Solomon Islands: see PACIFIC ISLANDS, BRITISH; TRUST TERRITORIES.

Somalia. This Italian trust territory in East Africa is bounded southeast by the Indian ocean, west by Kenya and northwest by Somaliland protectorate and Ethiopia. Area: 198,275 sq.mi. Pop. (1954 est.): 1,269,000, including 30,000 Arabs, 1,000 Indians and 5,000 Italians. Chief Somali tribal groups: Darot, Hawiya, Rahanuin, Dighil, Dirr and Tunni, nomadic or seminomadic pastoralists. Religion: Sunni (Shafi) Moslem. Capital, Mogadishu, pop. (1952 est.) 50,000. Administrator in 1955, Enrico Martino.

History.—With the granting on Oct. 12, 1954, of a national flag to Somalia, the Italian administration underlined the considerable progress the country had made during the first five years of the trusteeship. By 1960 young Somalis were to be prepared to take over the reins of government now held by Italians. Although the latter had serious doubts about the country's ability to "go it alone" economically, they credited the young Somalis with great will and ability to pick up the essentials of government. About 70 Somalis, ranging in age from 17 to 30, were undergoing a three-year course at a special school of political administration. In 1955 Somalia had a total school population of more than 23,000 as compared with 3,000 in 1949.

Total civilian expenditure for 1955 was estimated at 67,632,000 somali and total revenue at 31,800,000 somali, the deficit being covered by direct grant from Italy and the subsidized market for bananas, Somalia's principal export, also provided by Italy. (See also TRUST TERRITORIES.)

Education.—Schools (1954-55): primary (including nursery and adult) 232, pupils 23,346, teachers 420; secondary (including 1 teachers' training school with 37 students; other vocational in parentheses): 23 (13), pupils 1,328 (575), teachers 119 (65, excluding Italian commercial school); 1 institute of legal, economic and social studies, students 19 (of which 14 Somalis), 1 professor.

Finance.—Monetary unit: somalo (=14 cents U.S.). Budget (July 1953-Dec. 1954, actual; 1955 est. in parentheses): revenue 132,896,177 somali, including 81,703,000 somali grant-in-aid from Italy (87,232,000 somali, including 55,432,000 somali grant-in-aid from Italy); expenditure 132,207,031 somali (87,232,000 somali).

Foreign Trade.—(1954) Imports 81,893,400 somali; exports 62,252,000 somali (bananas 43,586,700 somali; hides and skins 6,118,000 somali; cotton 2,284,500 somali).

Somaliland, British: see BRITISH EAST AFRICA.

Somaliland, French. This overseas territory of the French union in the Gulf of Aden is bounded north, northwest and southwest by Ethiopia and southeast by the Somaliland Protectorate. Area: 8,494 sq.mi. Pop. (1952 est.): 61,625, including 27,360 Somalis, 25,202 Danakils, 6,007 Arabs, 2,357 Europeans; (1954 est.) 63,000. Capital, Jibuti, pop. (1953 est.) 27,723. Governor in 1955, René Petitbon.

History.—The governor made two visits in the course of 1955: one, in January, to the emperor of Ethiopia; the other, in February, to the imam of Yemen. Railway and harbour rates were lowered, to facilitate competition with the Assab route, which was attracting Ethiopian traffic. (HU. DE.)

Education.—Schools, 1953: primary 14, pupils 1,501; secondary (including teacher training) 4, pupils 88; vocational 5, pupils 196.

Foreign Trade.—(1954) Monetary unit: Jibouti franc=1.64 metropolitan francs. In 1955, U.S. \$1=350 metropolitan francs. Imports 2,231,000,000 Jibouti fr., including 764,000,000 Jibouti fr. from France; exports 2,653,000,000 Jibouti fr., including 2,475,000,000 Jibouti fr. for ships' provisions.

South Africa, British: see BRITISH SOUTH AFRICAN TERRITORIES.

South Africa, The Union of. A realm of the Commonwealth of Nations, the Union of South Africa extends from the southernmost point of the African continent northward to the Limpopo, Molopo and western Orange rivers. The mandated territory of South-West Africa is administered by South Africa. (See also TRUST TER-

Province	Area (sq. mi.)	Population (1951 census)*	Capital (total and European pop., 1951 census)†
Cape of Good Hope	278,839‡	4,426,726	Capetown (571,638; 242,493)
Natal	33,578	2,415,318	Pietermaritzburg (74,399; 31,512)
Orange Free State	49,866	1,016,570	Bloemfontein (109,130; 47,856)
Transvaal	110,450	4,809,145	Pretoria (283,148; 149,614)
Total, Union of South Africa	472,733§	12,667,759	
South-West Africa	317,725	414,601¶	Windhoek (20,490; 10,246)

*Revised figures. †Revised preliminary figures. ‡Including Walvis Bay (374 sq. mi.) an enclave of Cape province administered with South-West Africa. §Excluding Marion Island (about 85 sq. mi.) and Prince Edward Island (about 18 sq. mi.), subantarctic dependencies. ¶European 20.9%, African 67.5%, Asian 2.9% (mainly in Natal), Coloured (mixed) 8.7% (mainly in Cape). ¶Including 48,588 Europeans.

RITORIES.)

Total pop. (1954 est.): Union, 13,393,000; South-West Africa 447,000. Official languages (1946 census, Europeans only): 69% spoke Afrikaans and English, 17% English only, 14% Afrikaans only; Africans, generally Bantu (Xhosa, Zulu, Swazi, etc.).

Adherence to the most important religious groups at the 1946 census was as follows:

	European (%)	Coloured (%)	African (%)
Dutch Reformed	53.8	31.5	3.4
Anglican	15.8	20.0	7.1
Methodist	7.6	9.7	12.9
Roman Catholic	5.0	6.0	4.3

Also: Europeans 4.4% Jewish; Coloureds 10.8% Congregational; Africans 9.7% members of native separatist churches, 5% Lutherans; Asians 63.2% Hindu, 21.5% Moslem. Of non-Europeans, 51% were Christian.

Capetown is the seat of the legislature, Pretoria that of the government and Bloemfontein that of the supreme court. Other principal towns (total pop. and European pop., 1951 census): Johannesburg (880,014; 359,539); Durban (475,026; 150,826); Port Elizabeth (188,617; 78,529); Germiston (149,982; 65,978); Springs (119,351; 31,513); East London (90,978; 43,807). Queen, Elizabeth II. Governor general in 1955, Ernest George Jansen. Prime minister, J. G. Strijdom.

History.—Of the members of J. G. Strijdom's cabinet, constituted in Dec. 1954, the minister of posts and telegraphs and minister of social welfare, J. J. Serfontein, and the minister of labour, Senator J. de Klerk, were newcomers. The governor general, E. G. Jansen, was reappointed for a further five-year period of office.

Legislation.—Vigorous controversy marked the passage of the Senate act introduced late in the parliamentary session. The act enlarged the senate from 48 to 89 members. By abolishing the previous system of proportional representation and by increasing the number of senators nominated by the government, the act ensured that in the reconstituted senate, the present government would have 77 members and the opposition only 8 (the latter all elected from Natal). The purpose of this was to assure the government of a two-thirds majority when both houses of parliament sat together to remove the Cape coloured voters from the common electoral roll, a step anticipated in 1956. This measure was passed in the face of strong opposition from the English-speaking minority who saw in it a breach of the constitution. Even some Afrikaners, led by a small group on the staff of Pretoria university, opposed the bill. They were supported by protests, widely signed, from members of the staff in all four English-speaking universities. A women's movement and a new body, the covenant, were formed to continue public protests in defense of the constitution. The government claimed that as the necessity of altering the coloured franchise had been endorsed by the electorate the legal means (as required by the supreme court) to effect this aim had to be devised. A sharp difference of opinion developed within the United party over the question whether, if and when it was returned to power, the party would restore the coloured voters to the common roll. Holding that the party was pledged to do so, Bernard Friedman, a liberal member, resigned his seat and contested the ensuing by-election in the Hillbrow division of Johannesburg as an independent, but he was defeated.

Another measure that aroused controversy was the bill to enlarge the appellate division of the supreme court from five to eleven judges. The bill also provided that the full court must sit in all future cases in which the validity of an act of parliament was challenged. The Johannesburg bar attacked the bill and there was criticism within the legal profession of the government's nominations to the enlarged court. Other important measures passed during the session included: a bill making it a criminal offense to leave the Union without a passport or (in the case of holders of non-Union passports) an official permit; a bill to extend the powers of the police; bills to tighten the laws relating to racial zoning in group areas and to the residence of African servants in blocks of urban flats.

Economic Position.—In March the new minister of finance, Eric Louw, introduced his first budget. The year 1954–55 yielded a surplus of £10,000,000, thanks to inland revenue producing £6,200,000 more than had been expected. This surplus was transferred to loan account. Expenditure in the coming year was estimated at nearly £240,000,000. There was a new tax of 5s. in the pound on undistributed profits of public and private companies and also a new tax on donations designed to prevent tax evasion, both subject to certain concessions. Louw continued the policy adopted by his predecessor of making provision out of current revenue for a part of the loan expenditure by taking £15,000,000 from revenue as a contribution to the loan account. The Union's satisfactory financial position was confirmed in August when the governor of the South African reserve bank, M. H. de Kock, made his annual survey. The balance of payments showed an improvement over recent years. The Union's reserves had increased from £75,000,000 at the end of 1953 to £88,400,000 at the end of June 1955. Of the latter amount, gold accounted for £75,000,000 and dollars for £13,000,000. The special arrangement for the sale of gold to the United Kingdom lapsed by mutual agreement because the United Kingdom was again in a position to acquire the major portion of South African gold in open competition with the rest of the world. The total national income of the Union rose by a further £95,000,000 to £1,521,000,000, i.e., by 6.5% more than the previous year, while the average wholesale and retail price indexes rose by only about 1.4%. The bank rate was raised from 4% to 4½%. The phenomenal rate of economic expansion that the country had experienced in the past eight years was bound to decline, notably in the tempo of private development. For that reason the need to restrain new development had become less urgent. The shortage of labour was still felt but it was met to some extent by intensive recruiting both within and outside the Union. A determined effort to meet the mounting transport requirements of the country was made by the railways and harbours administration which undertook an extensive program of capital expenditure reaching the record total of £60,000,000. Second only to gold as an export commodity, 295,000,000 lb. of wool were sold for £60,000,000. A record total of 6,350,000 cases of oranges—three-quarters of the whole crop—were exported. The maize crop was so large as to cause anxiety about the disposal of the surplus.

Race Relations.—In this field the position was quieter than in recent years. The application of the Bantu education act, providing for government control of former mission schools and institutions, was resisted. On the Witwatersrand an organized boycott of the African schools was effective in some centres. It was broken when the minister of native affairs decided to expel all children whose parents kept them away, but later this decision was modified on certain conditions. The University College of Fort Hare was closed for two months because of the alleged recalcitrant behaviour of the African students. A commission of inquiry reported the situation as serious, finding faults in both students and the authorities. Contrary to general

expectation, the removal of 60,000 Africans from the western urban areas of Johannesburg was, in its first stages, completed without trouble in the presence of large police and defense forces. A new African township at Meadowlands was opened to accommodate those removed from the western areas. At Klip-town near Johannesburg in June a "congress of the people," having aroused widespread interest among non-Europeans, was attended by 3,000 delegates who adopted a "charter of freedom" setting forth a series of far-reaching demands for racial equality and other fundamental economic and social changes in South African society. The police raided the gathering at its conclusion.

International Affairs.—An exchange of letters between the Union government and the United Kingdom government announced the transfer of the naval base at Simonstown, near Capetown, by Great Britain to South Africa, not later than March 31, 1957. It was agreed that the British navy would continue to have facilities at the base. The Union government undertook to maintain the base in a state of efficiency not inferior to that existing at the time of transfer, and to pay to the United Kingdom £750,000 for the property. South Africa also agreed not to require U.K. admiralty personnel on loan to learn the Afrikaans language. A further condition stated that there would be no racial discrimination in employment at the base. The pact was welcomed in both countries by all political parties. The Union government decided to expand the South African navy in the next eight years. Six frigates and ten coastal minesweepers would be purchased. An extensive radar network was also planned at a cost of more than £5,000,000. In announcing the Simonstown agreement, the prime minister declared that in the event of war between Communist countries and the western powers, South Africa "will have no choice but will simply be dragged into such a war by circumstances, whether we want to or not. Alone we could not protect our long coastline or the points of entry into our country. For this reason we must seek co-operation and contact with other countries who share our interest in Africa."

The United Nations again discussed the treatment of Indians in South Africa and also the administration of the former mandated territory of South-West Africa, but the Union declined to participate in further discussion on these subjects.

(See also UNITED NATIONS.)

(Ju. L.)

Education.—European schools under provincial control (1955): primary 2,170, intermediate 18, high schools 141, secondary and all age schools 344; pupils (1950) 1,514,847; teachers (1950) 47,002. Vocational: European state vocational schools (1955) 42, pupils 58,500; technical institutes 11; agricultural colleges 5. Teacher training colleges (European, 1955) 13, (non-European, 1948) 55; students (all races, 1950) 7,294. Non-European schools (1953) 5,346, pupils (1955) 900,000. Private schools (all levels, 1950): European 284, non-European 672. Universities (1955) 9, students (including external) 24,703. Nonwhite students 1,068. University College of Fort Hare (for Bantu), 374 students.

Finance and Banking.—Monetary unit: South African pound at par with the pound sterling and with an exchange rate of £(S.A.)0.359 to the U.S. dollar. Budget (1955-56 est.): revenue £(S.A.)259,100,000; expenditure £(S.A.)259,000,000. Total public debt (March 1954) £(S.A.)884,900,000, of which £(S.A.)61,700,000 external. Currency circulation (June 1954) £(S.A.)94,000,000, (Jan. 1955) £(S.A.)95,600,000. Bank deposits (June 1954) £(S.A.)318,100,000, (Oct. 1954) £(S.A.)338,900,000. Gold and foreign exchange (Aug. 1954) U.S. \$325,000,000, (May 1955) U.S. \$345,000,000.

Foreign Trade.—(1954) Imports £(S.A.)443,300,000; exports £(S.A.)317,700,000. Main sources of imports: U.K. 34%; U.S. and Canada 23%; continental European Payments union countries 17%. Main destinations of exports: U.K. 27%; other sterling area 23%; France 6%; other continental E.P.U. 19%; U.S. and Canada 6%. Main exports: wool 22%; diamonds (1953) 4%.

Transport and Communications.—Roads (1955): 316,640 km. Motor vehicles in use (1953): cars 538,000; commercial vehicles 145,000. Railways (1954): 21,600 km.; freight, ton-km. 22,960,000,000. Shipping: merchant vessels of 100 gross tons and over (July 1954): 149; total tonnage 129,000. Air transport (1954): passenger-km. 329,786,000; cargo, ton-km. 8,139,000; km. flown (1953) 10,514,000. Telephones (March 1954): 606,152. Radio receiving sets (1953): 665,000.

Agriculture.—(On farms and estates only, except as indicated.) Main crops (metric tons, 1954): wheat (total crop) 535,000; maize (corn)

3,315,000; barley 61,000; sorghum (total crop) 145,000; oranges and tangerines 279,000; grapefruit 14,000; lemons 3,000; (1953): potatoes (total crop) 184,000; groundnuts (peanuts) 197,000; sunflower seed 46,000; tobacco 18,200; (1952): dry beans 40,000; raisins 10,000; grapes 456,000. Livestock (Sept. 1953): cattle 11,655,000; sheep 35,992,000; pigs 537,000; poultry 15,725,000; horses (Sept. 1951) 676,000; goats (1951) 5,400,000. Production (metric tons, 1954): sugar, raw value 752,000; wool 63,000; meat 374,400 of which beef and veal 282,000; butter 37,000; cheese 12,240; milk (1953) 2,019,000; wine (1953) 288,000. Fisheries (catch landed, 1953): 374,000 metric tons.

Industry.—Industrial establishments (1951-52) 15,564, employing 254,877 Europeans and 544,105 non-Europeans. Index of employment (1954: 1948=100) 125, (1953) 123. Fuel and power (1954): coal 29,317,000 metric tons; electricity 14,634,000,000 kw.hr. Raw materials (metric tons, 1954): iron ore (60%-65% metal content) 1,893,000; pig iron 1,196,700; crude steel 1,431,000; copper (smelter) 40,980; (1953): asbestos 85,260; gold 11,940,616 fine oz.; diamonds 2,717,600 metric carats; ores (metal content, 1953): chrome 323,800; tungsten 231; antimony 2,730; manganese 332. Cement (1954) 2,162,100. New dwellings completed in 18 principal urban areas (1954) 11,868 metric tons.

South America: see ARGENTINA; BOLIVIA; BRAZIL; BRITISH GUIANA; CHILE; COLOMBIA; ECUADOR; FRENCH GUIANA; PARAGUAY; PERU; SURINAM; URUGUAY; VENEZUELA.

South Carolina. A south Atlantic state of the United States, eighth of the original 13 to ratify the constitution, South Carolina is known as the "Palmetto state." Area: 31,055 sq.mi. (750 sq.mi. inland water). Population: (July 1, 1955, est.) 2,226,000; (1950 census) 2,117,027; 61.1% white, 38.9% nonwhite (almost entirely Negro), 63.3% rural. Capital: Columbia, pop. (1950) 86,914. Chief cities (with 1950 population): Charleston, 70,174; Greenville, 58,161; Spartanburg, 36,795; Rock Hill, 24,502; Florence, 22,513; Sumter, 20,185.

History.—How to maintain racial segregation in public schools in spite of the 1954 supreme court declaration of unconstitutionality continued in 1955 to be the problem of greatest public concern. As the state anxiously awaited the result of further court hearings on how and when to desegregate, the legislature adopted with slight dissent the proposals of the Gressette committee previously established to suggest legal methods of circumventing the court. These included repeal of the compulsory attendance law, the law regulating school terms, and a law which gave a taxpayer the right to send his child to any school in any county where he paid taxes. Authority of local boards of trustees was increased by giving them the exclusive authority to operate or not operate schools, power to lease school property, and the right to transfer pupils from one school to another. It was also decreed that appropriations should cease for any school when any pupil was transferred to or from that school pursuant to a court order.

Subsequent to the May 31 directive of the supreme court that lower federal courts proceed with reasonable speed to enforce desegregation, a three-judge court ordered the trustees involved in the original Clarendon county case to proceed "with all convenient speed" but no time limit was set, and the trustees remained determined to close the school if necessary to prevent biracial attendance. Meanwhile there were organized in various communities pro-segregation "Citizens Councils" which in some cases exerted effective economic pressures on Negroes who had signed desegregation petitions or otherwise identified themselves with the movement. At the end of the year segregation continued in all public schools.

Constitutional amendments legalizing increased travel allowance for legislators and removing from the state oath of office the pledge against duelling received final approval. Significant legislation included a law for suspension of a motor vehicle driver's licence upon the accumulation of 12 demerit points assessed for traffic law violations, a law co-ordinating the state retirement system with federal old-age and survivors insurance, and an act requiring maximum penalties for third offense felonies. Investigations were ordered for the office of the state

insurance commissioner and for the state-owned Santee-Cooper hydroelectric power company. A Fiscal Survey commission was created to study the increasingly urgent problem of state finance.

Chief state officers in 1955 were: George B. Timmerman, Jr., governor; Ernest F. Hollings, lieutenant governor; O. Frank Thornton, secretary of state; Jeff B. Bates, treasurer; T. C. Callison, attorney general; Eldridge C. Rhodes, comptroller general; Jesse T. Anderson, superintendent of education; D. Gordon Baker, chief justice.

Education.—Continued progress was made in the sales tax supported program of 1951 to improve and equalize white and Negro school facilities. The legislature raised the school construction debt limit from \$100,000,000 to \$137,500,000 and by Oct. 18 the Educational Finance commission had approved (since the inauguration of the program) projects costing \$148,780,887 of which about 55% was for Negro schools. For the year ended June 30 current expenditures for public schools totalled \$79,747,890. Enrolment in white elementary schools was 213,932; in Negro elementary schools, 184,206; in white high schools, 99,000; in Negro high schools, 55,811. Elementary teachers numbered 6,858 white and 5,192 Negro; high school teachers, 4,225 white and 1,794 Negro.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ended June 30, 1955, public expenditures for relief of needy persons amounted to \$24,941,376 of which \$18,221,676 were federal funds. The total of 96,403 persons receiving assistance included 48,996 aged, 2,168 blind, 34,165 dependent children, 9,011 totally disabled and 2,063 needing general assistance. The average weekly number of persons receiving unemployment compensation was 13,185 and the amount paid in benefits during the year was \$12,328,026. On June 30 the funds available for unemployment compensation totalled \$68,784,756. Patients in the state hospital for mentally diseased, June 30, numbered 6,038; in the school for feeble-minded, 1,645. On the same date there were 1,884 in the state penitentiary, 213 in the Negro boys' reformatory, 267 in the white boys' reformatory, 60 in the Negro girls' reformatory, 96 in the white girls' reformatory.

Communications.—Highway mileage in the state system on June 30 was 24,633 of which 18,432 was paved; mileage of rural county roads was 25,843, largely unpaved. State highway department receipts for the fiscal year were \$50,384,895 and expenditures were \$50,122,417. Railroad mileage was 3,343. For the year ended June 30 the value of exports through the south customs district was \$122,500,000; of imports, \$64,200,000.

Banking and Finance.—On June 30, 1955, there were 27 national banks with 51 branches, 112 state banks with 23 branches, 14 cash depositories, and 1 military facility. Capital, resources and deposits were, respectively: national, \$35,463,000, \$526,570,000, \$487,032,000; state, \$30,968,391, \$323,549,938, \$291,399,861. Resources of the 37 state building and loan associations were \$88,342,767; of 38 federal associations, \$251,884,743. During the year ended June 30, 1955, the state operated under a general appropriations and surplus spending budget of \$171,530,620 and showed a general fund deficit at the end of the year of \$1,801,883. Total state receipts and expenditures were, respectively, \$301,276,346 and \$303,960,556. For the year begun July 1 the general appropriations act totalled \$171,570,517. The June 30 funded debt was \$146,298,792 of which \$99,198,000 was for public schools and colleges, and \$45,482,000 for highways. Federal internal revenue collected amounted to \$242,192,063; customs collections, \$5,646,830.

Table I.—Principal Crops of South Carolina

	Indicated 1955	1954	Average, 1944-53
Corn, bu.	30,940,000	11,718,000	25,972,000
Wheat, bu.	3,059,000	3,081,000	3,040,000
Oats, bu.	22,456,000	23,846,000	17,184,000
Hay, tons	404,000	262,000	412,000
Peanuts, lb.	10,725,000	5,700,000	14,876,000
Soybeans, bu.	2,250,000	910,000	589,000
Irish potatoes, bu.	1,102,000	1,595,000	1,979,000
Sweet potatoes, bu.	2,400,000	1,495,000	4,145,000
Tobacco, lb.	195,880,000	148,050,000	154,874,000
Cotton, bales	555,000	501,000	692,000
Pecans, lb.	650,000	2,800,000	3,357,000
Peaches, bu.	3,350,000	3,592,000

Source: U.S. Department of Agriculture.

Agriculture.—The official Oct. 24 estimate of total 1955 value of field and commercial truck crops was \$322,189,000, about 22% more than in 1954 when value was down (because of drought) to \$264,350,000 from 3,784,000 harvested acres. The 1955 peach crop was destroyed by a late March freeze. Cash farm income in 1954 was \$321,936,000 distributed as follows: crops, 227,894,000; livestock and products, \$91,261,000; government payments, \$2,781,000.

Manufactures.—The value of products manufactured in 2,003 establish-

ments during the year ended June 30, 1955, was \$2,410,165,766, an increase of \$140,160,332 over the previous year. Total manufacturing capital was \$1,227,541,810, an increase of \$79,288,861. Employees numbered 188,999, an increase of 2,564. Wages paid industrial workers totalled \$494,201,499. (C. E. CN.)

Table III.—Mineral Production of South Carolina

Mineral	(In short tons)		1953	
	Quantity	Value	Quantity	Value
Clays	947,000	\$4,675,000	964,000	\$4,802,000
Sand and gravel	1,048,000	892,000	2,976,000	2,564,000
Stone	2,915,000	3,881,000	2,914,000	3,976,000
Other minerals	5,083,000	...	6,429,000
Total	\$14,531,000	...	\$17,771,000

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in South Carolina in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953, South Carolina was first among the states in output of kyanite, second in vermiculite and ranked 43rd in the value of its mineral output, with 0.12% of the U.S. total.

South Dakota. A north central state of the United States, admitted to the union in 1889. Descriptive title: "Land of Infinite Variety." Area: 77,047 sq.mi., of which 511 sq.mi. are water. Population: (est. July 1, 1954) 659,000; (1950 census) 652,740, one-third urban, two-thirds rural. In 1950 the state had 23,334 Indians and 727 Negroes. Capital: Pierre, population (1950) 5,715. Principal cities: Sioux Falls, 52,696; Rapid City, 25,310; and Aberdeen, 21,051.

History.—The full output of a hard-working legislature which met for a sixty-day session in early spring was approved by Governor Joe Foss. Despite a record budget, the only new tax enacted was an additional 1% sales tax to finance a \$7,500,000 bonus for Korean veterans. Some governmental reorganization, particularly of state boards and commissions, was provided for in legislation recommended by a "Little Hoover Committee."

Most hotly debated of all legislation was a recodification of state school laws, fostering reorganization of school districts, and the establishment of directors of assessment on the county level instead of the township level. Opponents of both measures submitted petitions which would have suspended application of the laws pending referral to the voters in 1956. The petitions were, however, ruled invalid in the district court as improperly drawn.

By repeal of a 1936 law the legislature sought to halt further expansion of the fifteen Hutterite colonies in the state. Action was precipitated by Hutterite purchase of 6,080 ac. in the James river valley for the establishment of additional communal settlements, necessitated by a heavy birth rate. Sentiment against the proposed colonies was largely local and based upon a feeling that the existence of such communities detracted from towns in the area and that members did not contribute their proportionate share of taxes. Hutterites acted in violation of the statute in August to invite court review of the law.

Starting July 1 all persons paid from public funds were required to sign a loyalty oath.

Uranium activity was stepped up considerably in 1955. A new carnotite ore body was discovered in the Black Hills, where construction of an ore processing plant was begun June 24. Extensive deposits of lignite in the northwestern corner of the state, long known to be uraniferous, attracted prospectors who staked claims over the entire area. Whether these ores were of current commercial value remained in question. In September the Atomic Energy commission announced that prospects for a satisfactory metallurgical process were good.

Along the Missouri river work continued on the Oahe dam, largest of the main stem dams planned by the federal government, and on Gavins Point dam, the smallest. The river was closed off at the Gavins Point site on July 31. Congressional appropriations made in 1955 were designed to enable the corps of engineers to install the last two generators at Ft. Randall and

Table II.—Value of Principal Industrial Products of South Carolina

Industry	Year ending June 30, 1955	Year ending June 30, 1954
Textiles (including knitting)	\$1,604,691,784	\$1,493,400,618
Lumber products (barrels, boxes, baskets, veneering, paper and pulp, furniture, woodwork)	187,120,267	186,630,853
Clothing	123,761,684	113,567,846
Electricity	88,350,622	81,859,230
Fertilizers	35,388,557	36,663,609
Textile supplies	33,487,363	35,129,840

Source: South Carolina Department of Labor.

to bring Oahe to 18% and Gavins Point to 85% completion during the year ending July 1, 1956.

Elective state officers of South Dakota in 1955 were: governor, Joe Foss; lieutenant governor, Roy Houck; attorney general, Phil Saunders; secretary of state, Geraldine Ostroot; state treasurer, Ed Elkins; state auditor, Lawrence Mayes.

Education.—There were 271 public high schools maintained in South Dakota in the 1954-55 school year, with 2,028 teachers and 31,393 students. Public elementary enrollment was 100,784 students, with 5,451 teachers. In the 1952-53 school year 351 districts out of 3,400 provided educational facilities for two-thirds of all public grade school children and practically all public high school pupils. Schools were not operated in 844 rural districts. Total expenditures for public education (1954-55) were \$39,134,679. Harold S. Freeman was superintendent of public instruction.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total disbursements by the state for all penal and charitable purposes during the fiscal year ended June 30, 1955, were \$3,214,700; total for social services, \$9,930,633. The department of public welfare distributed \$5,862,893 in old-age assistance, \$2,768,042 as aid to dependent children, \$348,438 for disabled, and \$104,395 for the needs of blind persons. Average payment (May, 1955) for 10,814 aged was \$44.74; for 9,380 recipients of aid to dependent children, \$24.76; for 675 disabled, \$46.44; for 202 blind, \$43.68. Unemployment benefits for the fiscal year were \$1,384,338 to a total of 5,844 individuals; there were 56 new veterans' claims; total payments to all veterans were \$492,644. The state maintained one prison and one training school; expenditures during the fiscal year amounted to \$815,002. There were 423 inmates at the prison on June 30, 1955.

Communications.—In the year ended June 30, 1955, the state maintained a highway system of 6,470 mi.; county highway systems totalled 20,394 mi., other rural roads 61,356 mi. Total disbursements from the state highway fund during the year were \$28,089,417, the largest single item in the budget. There were 4,619 mi. of railroad in operation at the end of 1954 and a total of 170,975 telephones.

Banking and Finance.—There were 136 state banks in operation as of June 30, 1955, with resources of \$295,025,720 and total deposits of \$270,887,851; 35 national banks with resources of \$316,435,000 and deposits of \$294,790,000. Eight state building and loan associations reported total assets of \$14,231,594; five federal savings and loan associations had total assets of \$17,773,000.

Total receipts of state agencies for the year ended June 30, 1955, \$79,472,099; total disbursements, \$90,899,281, including retirement of the last \$9,000,000 of rural credit bonds dating from the 1920s. This left the state free of all bonded indebtedness.

Table I.—Principal Crops of South Dakota

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	83,140,000	115,913,000	108,013,000
Wheat, bu.	28,325,000	27,008,000	43,157,000
Oats, bu.	105,380,000	113,772,000	98,658,000
Barley, bu.	9,386,000	9,320,000	22,439,000
Rye, bu.	3,718,000	2,460,000	4,202,000
Flaxseed, bu.	5,670,000	5,598,000	4,833,000
Potatoes, bu.	1,338,000	1,680,000	2,139,000
Soybeans, bu.	3,156,000	3,114,000	5,820,000
Hay, tons	4,100,000	4,878,000	3,617,000

Source: U.S. Department of Agriculture.

Agriculture.—Dry weather during July and August 1955 sharply reduced the corn and soybean crop, and livestock prices ran 15% below 1954.

In 1954 the total cash farm income, including government payments, was \$537,000,000. Roughly two thirds of this amount was derived from livestock. Government payments for soil conservation and sugar beets amounted to \$5,700,000. A farm census taken in 1954 revealed that there were 4,000 fewer farms than in 1950.

Manufactures.—Employees engaged in manufacturing numbered 11,900 in June 1955, with average weekly earnings of \$68.43; employees in nonagricultural establishments, 125,800; value added by manufacture in 1953, \$80,703,000. Leading industries: food and kindred products, printing and publishing. (Ev. W. S.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in South Dakota in 1952 and 1953 (pre-

Table II.—Mineral Production of South Dakota

(In short tons, except as noted)

Mineral	Quantity 1952	Value 1952	Quantity 1953	Value 1953
Clays	293,000	\$ 2,641,000	331,000	\$ 2,826,000
Feldspar	45,000	221,000	57,000	321,000
Gold (oz.)	483,000	16,889,000	534,000	18,725,000
Sand and gravel	5,846,000	2,478,000	5,402,000	2,828,000
Silver (oz.)	132,000	120,000	139,000	125,000
Stone	1,671,000	4,807,000	1,189,000	4,996,000
Other minerals	3,299,000	...	4,075,000
Total		\$30,455,000		\$33,896,000

liminary) whose value exceeded \$100,000. In 1953 South Dakota was first among the states in production of gold, second in feldspar, and fourth in mica; and ranked 36th in the value of its mineral output, with 0.24% of the U.S. total.

Southeast Asia Treaty Organization. Signed on Sept. 8, 1954.

at Manila, Phil., the Southeast Asia Defense treaty provided the legal and political foundation for a new barrier to communist aggression in southeast Asia. The treaty established nothing more than a foundation, however, and it was not until 1955 that the bones of the legal agreement were clothed with the flesh and blood of specific military arrangements.

The Southeast Asia Treaty organization (SEATO) came into effect at a conference at Bangkok, Thai., Feb. 23-25, 1955. It had taken nearly six months to get the Manila pact ratified, and the proclamation that the treaty was in force had come only on Feb. 19. No further changes had occurred in the original line-up of powers. The three Asian signatories (Pakistan, the Philippines and Thailand), the two south Pacific members (Australia and New Zealand) and the three global powers (United Kingdom, France and the United States) had stayed in despite demands from the communists and neutralists that some or all of them withdraw. No nations had been added despite other demands that Nationalist China, the Republic of Korea, Japan or other nations be included.

The purpose of the Bangkok conference was overstated by a great many sources. Some official and press commentators expected the Manila pact to result in a counterpart to the North Atlantic Treaty organization (NATO), with an elaborate, unified military headquarters, possibly located in Singapore. The actual organization of SEATO was quite different.

SEATO started with what the NATO organizers called "infrastructure," the practical co-ordination of the national military forces and the working-level military arrangements, before passing to a show of international command and high-level staffing.

There was evidence that the U.S. and British staff officers, both diplomatic and military, who set up SEATO were thoroughly familiar with the practical experiences of NATO and were desirous of avoiding the top-heavy features which had been necessary in Europe but which would not be required in an area possessing a wider variety of strategic possibilities. The SEATO structure was therefore very simple:

The SEATO secretariat was composed of the ambassadors of the signatories accredited to the Thai kingdom, together with a Thai foreign office official; it was located in Bangkok.

The military committees were given full freedom to meet at their own convenience and were organized at various levels, including both staff and advisory conferences.

Economic and cultural committees were given the opportunity of getting down to practical work before they became formalized in elaborate headquarters. Throughout 1955 these committees remained active. They were aware of the work of the Economic Commission for Asia and the Far East, under the United Nations structure, and sought to supplement the work of the UN instead of replacing it.

The progress in SEATO was at least partially responsible for two major developments in the neutralist Asian world and the communist world. The government and press of India remained antagonistic to SEATO throughout the year; the Indian sponsorship of the Asian-African conference at Bandung in April was construed partly as a direct or indirect attack on SEATO. A conference of the communist and communist-controlled governments at Warsaw, Pol., set up in May a Warsaw convention providing for military co-ordination against U.S. or British operations. The Warsaw pact established a counterpart to both NATO and SEATO in that a political-military organ, the Political Consultative committee, served as a clearinghouse for both strategic and diplomatic information.

From the communist point of view, self-defense against communism is invariably aggression. It was not at all surprising,

therefore, that the attitude of communist China toward SEATO remained implacably hostile throughout the year, following the tone of Chou En-lai's charge before the People's Political Consultative conference at Peking that by means of SEATO the United States was seeking to encircle China, to destroy the Korean armistice and to prepare for a new world war. This communist propaganda line wore thin as 1955 developed and was overshadowed by the more momentous developments connected with the meetings of the heads of state of the Big Four Powers at Geneva.

On the side of the democratic world, SEATO slipped into place as a valuable though unobtrusive diplomatic and strategic mechanism for maintaining a minimum of preparedness in southeast Asia. The United States possessed direct, bilateral security agreements with every other anticommunist nation in the far east (save for Indochina, where sweeping arrangements were prohibited by the Geneva settlement), including Japan, insular China and South Korea. In April John Foster Dulles, U.S. secretary of state, said that he thought it desirable to tie together this complex of treaties into a new agreement and a new organization, but throughout 1955 the separate arrangements worked well in practice. The uncertain state of world diplomacy made a further step impracticable at that time. (See also ASIAN-AFRICAN CONFERENCE; GENEVA BIG FOUR CONFERENCES OF 1955.)

Soybeans. The 1955 U.S. soybean crop was indicated at a new high record 371,898,000 bu., as compared with the previous record of 342,795,000 bu. in 1954 and an average of 238,488,000 bu. for 1944-53. Acreage for harvest was increased to a record 18,397,000 ac., 8% more than 1954 and far in excess of the 11,987,000-ac. average for the previous decade. The indicated yield was 20.4 bu. per acre as compared with 20.1 bu. in 1954 and an average of 19.9 bu. per acre. As usual, Illinois with 104,190,000 bu. was the leading producer, followed by Indiana (46,508,000 bu.), Minnesota (45,532,000 bu.), Iowa (42,237,000 bu.), Missouri (34,740,000 bu.) and Ohio (31,125,000 bu.).

Support prices were reduced from \$2.22 per bushel (80% of parity) on the 1954 crop to \$2.04 per bushel (70% of parity) on the 1955 crop. Seasonal price developments were unusual on the 1954 crop; highest prices were attained during the harvest period followed by a slow, irregular decline thereafter. Prices to producers were \$2.08 per bushel in Oct. 1955, against \$2.54 per bushel a year earlier. About 17,000,000 bu. of the 1954 crop were taken over by the Commodity Credit corporation under price support operations, of which most was sold for export. Carry-over stocks were moderate. Exports amounted to a record 60,000,000 bu., with Japan and western Europe the major takers.

World production in 1955 was indicated at a record high of 763,870,000 bu. as compared with 717,295,000 bu. in 1954 and a pre-World War II (1935-39) average of 463,720,000 bu. Area utilized was 44,050,000 ac. as compared with 42,765,000 ac. in 1954 and 29,000,000 ac. in 1935-39. China and Manchuria accounted for 330,000,000 bu. of the total as against 320,000,000 bu. in 1954 and about 360,000,000 bu. annually in the years immediately prior to World War II.

(J. K. R.)

Spain. A country of southwestern Europe, Spain is bounded north by the Bay of Biscay and France, west by the Atlantic ocean and Portugal and south and east by the Mediterranean sea. Area: 194,945 sq.mi., including Balearic (1,936 sq.mi.) and Canary (2,804 sq.mi.) islands. Pop.: (1950 census) 27,976,755, including Balearic (422,089) and Canary (793,328) islands; (mid-1955 est.) 28,976,000. Language: mainly Spanish (Castilian), but Catalan, Galician and Basque are also spoken. Religion: Roman Catholic; Protestants, about 12,000. Chief towns (pop., 1953 est.): Madrid (cap.) 1,641,954; Barcelona 1,288,283; Valencia 515,917; Seville 383,900; Málaga 278,505; Zaragoza 267,952; Bilbao 229,334; Murcia 224,558; 16 towns with a population of 100,000 to 200,000. Chief of state, president of the council of ministers and commander in chief in 1955, Gen. Francisco Franco.

History.—Foreign Relations.—The year 1955 saw the continuation of the work on air and naval bases which, in accordance with the terms of the U.S.-Spanish agreement of Sept. 1953, had begun in 1954, and it was expected that the air bases of Torrejón (near Madrid) and Zaragoza would be operational by the autumn of 1956. Work also began on the new naval base at Rota near Cádiz and on the 487-mi. pipeline from there to Zaragoza, also planned to be fully functioning by the end of 1956. Naval facilities were also planned for vessels of the U.S. navy at the already existing Spanish bases at El Ferrol, Cartagena and Palma de Mallorca. During the two years following the conclusion of the agreement \$244,000,000 was allocated to military expenditure. In addition to the above expenditure, the U.S. government let it be known that \$350,000,000 would be spent on modernizing the equipment of the Spanish armed forces. A number of tanks and other war materials of U.S. manufacture arrived in Spain during the year, and it was announced that a group of U.S.-built jet fighters, with Spanish pilots and a projected strength of 230, was in process of formation.

As regards U.S. financial and economic aid to Spain, there was a disposition in Spanish official quarters to cavil at its alleged inadequacy. On this account \$85,000,000 had been allocated in 1953 and a similar sum in 1954, but with the important difference that in the latter case only \$30,000,000 could be expended on capital goods, the remaining \$55,000,000 being earmarked for the purchase of U.S. agricultural surpluses.

On Feb. 24 John Lodge presented his letters to Franco accrediting him as U.S. ambassador to the Spanish government in succession to James C. Dunn.

Spain continued to maintain normal diplomatic relations with all states of any importance with the exception of the Soviet Union, the "iron curtain" countries and communist China. An indication of the gradual improvement of Spain's international status was the submission of its candidature for membership of the United Nations, which the United States undertook to support. Anglo-Spanish commercial relations remained satisfactory, the United Kingdom retaining the position of Spain's best customer, but political relations were not altogether cordial because of the continuance, although in a rather less intensive form, of the officially instigated Spanish agitation for the return of Gibraltar. The policy of fostering good relations with the Islamic world and in particular with the Arab states was continued, the latter, together with Turkey, absorbing about two-thirds of Spain's textile exports.

Franco and the Monarchy.—The internal political situation was static. There was no change in the composition of the government and the only development of importance was the taking by Franco of the first overt steps toward the realization of his avowed intention of restoring the monarchy. For various reasons, however, he was opposed to a restoration in the person

of the present legitimist claimant to the throne, Don Juan, third son of King Alfonso XIII, and favoured instead the education in Spain of the elder son of Don Juan, Prince Juan Carlos, aged 17, with a view to his eventual succession on coming of age (at 30) as laid down in the law of succession of 1947. Prince Juan Carlos entered the General Military academy at Zaragoza in Sept. 1955. There was, however, evidence that the government party, the Falange, which was predominantly antimonarchist, viewed the prospects of a restoration with disfavour, and Franco during the course of the year issued statements designed to convince the party that a restoration was in the national interests.

Economic Position.—The existence of a press censorship and the prohibition of the strike weapon as a means of adjusting industrial grievances continued to make it difficult to assess labour conditions accurately. The level of employment was satisfactory, the number of unemployed averaging about 150,000, though these figures probably did not include agricultural unemployment, which fluctuated greatly in accordance with local conditions. The housing shortage, especially workers' dwellings, remained acute, and a \$75,000,000 five-year plan for building cheap workers' dwellings was sanctioned in July.

Industrial activity was well maintained. The expansion of the hydroelectric grid and the construction of thermal power plants was pushed ahead, and for the second summer in succession the dry season brought no appreciable power cuts. The new state-sponsored steelworks at Avilés in Asturias, which was expected to go into limited production in 1956, was designed eventually to double the national steel production.

Increasing interest was shown in the possibility of the application of nuclear energy, and in June Spain concluded an "atoms for peace" agreement with the United States, being also represented at the "atoms for peace" conference at Geneva two months later. Extensive uranium deposits were reported to have been discovered in the Sierra Morena, and a number of Spanish engineers were sent to the United States for training in nuclear physics.

Agriculture had a reasonably good year, the important foreign currency-earning citrus fruit export being well up to expectations. The wheat crop of 3,700,000 tons was disappointing, but it was estimated that reserves (1,100,000 tons) would obviate the necessity of imports.

In the field of domestic legislation the principal novelties were the promulgation of a law levying a surtax assessed on exterior signs of wealth and a decree prohibiting civil servants of the higher categories (cabinet ministers, ambassadors, directors of government departments, high officials of the Falange party, etc.) holding other posts in their respective services or gainful positions in official or private companies. (AL. WA.)

Education.—Schools (1952–53): primary (including private) 65,411, pupils 2,887,090, teachers 80,719; secondary 119, pupils 247,713; vocational, pupils 159,690. Teacher training schools (primary) 106, students 25,421. Universities 12, students 58,143, professors and lecturers (1952) 3,268.

Finance and Banking.—Monetary unit: peseta, with an official buying rate of 21.90 and controlled free rate of 38.95 pesetas per U.S. dollar. Budget (1954 est.): revenue 26,074,200,000 pesetas; expenditure 26,020,800,000 pesetas. Total public debt (1954): 86,896,700,000 pesetas. Currency circulation: (May 1954) 37,800,000,000 pesetas; (May 1955) 42,100,000,000 pesetas. Bank deposits: (Sept. 1954) 59,900,000,000 pesetas; (Dec. 1954) 64,400,000,000 pesetas. Gold reserves (May 1955): U.S. \$56,000,000.

Foreign Trade.—(1954) Imports \$614,000,000 (1,880,900,000 special gold pesetas); exports \$464,000,000 (1,421,600,000 special gold pesetas). Main sources of imports:

U.S. 18%; sterling area 13%; Germany 11%; franc area 11%. Main destinations of exports: sterling area 19%; Germany 19%; U.S. 10.3%; franc area 7.5%. Chief exports (1954): oranges 15%; wine 6%; iron ore (1953) 5%.

Transport and Communications.—Roads (1954): 120,763.6 km., of which 73,475.8 km. national roads. Motor vehicles in use (1954): cars 116,511; commercial vehicles 99,404. Railways 17,307 km., of which approximately 13,090 km. state lines; traffic (state only) passenger-km. (1953) 7,977,000, freight ton-km. (1954) 7,689,000. Shipping: merchant vessels of 100 gross tons and over (July 1954) 1,166; total tonnage 1,312,601. Air transport (1953): passenger-km. 285,932,000; freight ton-km. 1,387,000; 11,548,000 km. flown. Telephones (Jan. 1954): 903,097. Licensed radio sets (1953): 1,313,000.

Agriculture.—Main crops (metric tons, 1954): wheat 4,541,000; barley 2,135,000; oats 542,000; rye 487,000; maize (corn) 691,000; rice 352,000; chick-peas 121,000; lentils 20,000; broad beans 99,000; potatoes 3,515,000; cottonseed 34,000; cotton, lint 21,000; oranges, etc., 1,110,000; bananas 245,000; olives 1,296,000; flax 10,400; hemp 9,800; (1953) groundnuts (peanuts) 11,000; tobacco 31,700; sweet potatoes and yams 148,000; lemons, limes, etc., 49,000. Livestock: (Sept. 1954) sheep 20,000, pigs 5,000; (Sept. 1953) cattle 3,184,000, horses 650,000, mules 1,156,000, asses 799,000, chickens 26,623,000, goats (1950) 4,135,000. Production (metric tons, 1954): beet and cane sugar, raw value 268,000; olive oil 276,000; wine 1,776,000; wool 26,000. Fisheries: total catch (1953) 634,700 metric tons.

Industry.—Fuel and power (metric tons, 1954): coal 12,382,000; lignite 1,741,000; electricity 8,606,000,000 kw.hr. Production (metric tons, 1954): pig iron 924,000; crude steel 1,097,100; copper, blister 5,760; lead, refined 56,690; zinc, smelter 22,830; cement 3,301,000; iron ore (50% metal content) 3,405,000; potash (1953) 166,000. Other ores (metal content, 1953): tungsten 1,531; manganese 14,900; antimony 563; pyrites 1,783,000. Textiles (metric tons, 1954): cotton yarn 53,400; wool yarn 14,040; rayon filament yarn 12,380; rayon staple fibre 27,080. New dwelling units completed (1954) 24,722. Index of industrial production (1948=100): general (Dec. 1953) 150; mining (Jan. 1955) 143; gas and electricity (Jan. 1955) 185.

Spanish-American Literature: see LATIN-AMERICAN LITERATURE.

Spanish Colonial Empire. Under this heading are grouped the Spanish possessions in Africa. Their total area is approximately 134,477 sq. mi. and the total population (1950 census) 1,402,004. Areas, populations, capital towns and governors of the territories are given in the table.

History.—Spain's policy of cultivating the good will of the Islamic world continued to be the guiding principle in its relations with the native population of its Moroccan protectorate, an added motive for seeking whose good will being Spain's irritation over France's failure to consult regarding the deposition in Aug. 1953 of Sultan Mohammed ben Yussef, whose nephew, Muley Hassan Hassan ben el-Mehdi, was *khalifa* (sultan's representative) in the Spanish zone. The Spanish government made no secret of the fact that in principle it favoured the cause of the dethroned sultan and thus openly sympathized with those extensive sectors of the population of the French zone who were bitterly opposed to France's Moroccan policy.

In September the Spanish government addressed a note to the French government contending that, while the re-establishment of order in French Morocco was the responsibility of France alone, Spain should of right be admitted to participate in any negotiations between the French and Moroccan authorities having as their object the modification of the regime in the French zone.

According to the 1955 budget estimates the central govern-

Country	Area (sq. mi.)	Population (1950 census)	Capital	Status	Governor
Spanish Morocco					
Northern zone	7,589	1,010,117 (incl. 84,716 Spanish)	Tetuán pop. (1950 census) 80,732	Protectorate	High commissioner: Lieut. Gen. Rafael García Valiño y Marcen Khalifa (vicerey): Muley Hassan Hassan ben el-Mehdi
Southern zone	12,693	5,878	Cabo Juby	Protectorate	
Ifni territory	579	38,295	Sidi Ifni pop. (1950 census) 7,951	Colony	
Ceuta, Melilla, Alhucemas, Chafarinas and Peñón de Velez	82	141,302	—	Administered as part of Spain	
Spanish Sahara					
Rio de Oro	71,043	1,304	Villa Cisneros pop. (1950 census) 1,011	Colony	—
Saguia el Hamra	31,660	6,445	Santa Isabel, on	Colony	—
Spanish Guinea	10,831	198,663	Fernando Po pop. (1950 census) 11,098	Colony	—
including Fernando Po and four small islands					

ment's expenditure on Spanish possessions in Africa amounted to 1,099,600,000 pesetas, an increase of 1,074,000 pesetas on expenditure for 1954. Of this sum the greater part was earmarked for military expenses in the protectorate. (AL. WA.)

Finance.—*Spanish Morocco*, budget (1953 est.): balanced at 378,800,000 pesetas. *Spanish Guinea*, budget (1953): balanced at 73,936,000 pesetas.

Foreign Trade.—*Spanish Morocco* (1952): imports 933,900,000 pesetas; exports 571,500,000 pesetas. *Spanish Guinea*, exports (1953, metric tons): to Spain, cocoa 10,604.1, coffee 5,339.4, timber 87,030.3, other items 21,532.4; to rest of world 16,327.4; imports from Spain 317,315,200 pesetas. *Spanish West Africa*: exports 38,702,750 pesetas; imports 34,041,980 pesetas.

Transport and Communications.—*Spanish Morocco*: roads (1953) 869 km.; railways (1951) 173 km. Motor vehicles (1953): 2,875. Telephones (Jan. 1954): *Spanish Morocco* and *North Africa* 12,396; *Spanish Guinea* 525; *Spanish West Africa* 166.

Spanish Literature. During 1955 works such as expressions of the fervour of the Marian year (1954) or of antagonism to the *status quo* of Gibraltar which reflected the national conscience and pride achieved rewarding success, which might be temporary for *La Muralla* of J. Calvo Sotelo (more than 500 performances in Madrid and 300 in Barcelona, 1954–55), which carried the author into the Academy, and its Barcelona parallel, *La Herida Luminosa* (*La Herida Luminosa*) of J. M. de Sagarra. *La Mujer Nueva*, a novel of Carmen Laforet describing a similarly orthodox solution to a *crise de conscience*, won the Menorca prize of 200,000 pesetas. But in general writers sought a more individual and human expression.

Renewing the faith of the older masters—Unamuno, Machado, J. R. Jiménez—and the newer—Aleixandre—poets eschewed the feverish *desasosiego* of recent religious verse and pursued with more noble equanimity the search for understanding of that *tercer mundo profundo: exacta luz y clara poesía* of Dámaso Alonso's *Hombre y Dios*. Expression was simplified and found in nature renewed inspiration; but poetry rarely strayed from supernal mysteries to delight in simple things.

In prose an identical preoccupation with the individual, as a person rather than a soul, maintained the contemporary series of autobiographies and biographies and, in fiction (both novel and short story), developed the modern picaresque form in which every single character—the hero is out-of-date—struggles to fulfil his more or less humble destiny on earth. Tremendous energy is released by the continuous splitting of the human atom, the “setting” of the experiment is described with the minute realism not of the scientist but of the poet concerned with it only as a function, not as a background. The whole process, from single to chain reaction explosions, was demonstrated by C. J. Cela in *El Gallego y su Cuadrilla*, a collection of *apuntes carpetovetónicos*, and in *Historias de Venezuela: La Catira*, a linguistic tour de force and an overwhelming imaginative creation, whatever the immediate validity of language or story.

Juan Guerrero Ruiz, *consul de la poesía española*, and Concha Espina, veteran novelist, aged 86, died during the year. The year's production (1954–55) was recorded in *Almanaque de Literatura 1955* and in J. de Entrambasaguas' *El Año Literario*.

Other notable works of the year included:

Poetry.—P. Salinas, *Poesías Completas*; F. García Lorca, *Obras Completas* (first publication in Spain); J. R. Jiménez, *Diario de Poeta y Mar* (definitive text); M. García Blanco, *Don Miguel de Unamuno y sus Poesías* (1954; critical anthology); J. A. Valente, *A Modo de Esperanza* (winner of the Premio Adonais, 1954).

Prose Fiction.—I. Aldecoa, *El Fulgor de la Sangre* (1954) and *Vísperas del Silencio*; A. M. Matute, *Pequeño Teatro* (1954); C. Kurz, *Duermen bajo las Aguas*; F. J. Alcántara, *La Muerte le Sienta Bien a Villalobos* (winner of the Premio

Nadal, 1954).

Theatre.—A further volume of *Teatro Español*; Unamuno, *Teatro* (four plays, 1954); L. Delgado Benavente, *Tres Ventanas*.

Scholarship.—J. Corominas, *Diccionario . . . etimológico de la Lengua Castellana*, 2 of 4 vol., authoritative; Manuel Palau, *Memories*. (R. F. B.)

Spices. U.S. imports of complementary spices were valued at \$34,838,000 in 1954–55 as compared with \$43,313,000 in 1953–54. Essential (flavouring) oils imported were valued at \$18,868,000 as compared with \$10,729,000 in the previous year.

Aside from pepper, U.S. annual consumption of spices was indicated to have increased by 37,000,000 lb. since World War II, and herb cookery received continued enthusiasm.

World pepper production continued to recover from its post-war low levels; the 1955 crop was forecast at 12% higher than in 1954 but 15% less than before World War II. World export availabilities were estimated at 116,000,000 lb. of the new crop plus substantial carry over, against a demand of not more than 120,000,000 lb. The U.S. imported 37,000,000 lb. in 1954. Wholesale prices in New York city during much of 1955 were less than 50 cents per pound as compared with \$2.65 per pound in Aug. 1950. Effectiveness of Indian marketing advantages were dissipated by rebound of the production of Sarawak and Indonesia—Bombay prices fell as much as 72% from June 1953 to June 1954. In Jan. 1955 India reduced export duties by approximately one-half.

World production of ginger was indicated at about 14,000 tons, 10,000 tons from India. The vanilla bean, at high price levels, met rapid and drastic curtailment of U.S. imports. Promotion of pure vanilla by Madagascan producers and the Flavouring Extract Manufacturers' association was initiated.

Among the flavouring oils, citrus oil supplies appeared adequate, with prices generally moderate but firm. Mint oils presented a diverse picture. Spearmint oil declined to about half the \$8 per pound level of 1954, whereas peppermint oil rose to \$8 per pound from a previous \$5 level. Among the spice oils, clove continued high in price but below its peak and readily available. Oil of cassia was exorbitant in price and very scarce, as was onion oil.

The American Spice Trade association celebrated its 50th anniversary in October. It reported the business as a \$150,000,000 per year one, using about 132,000,000 lb. of imported spices and 20,000,000 lb. produced domestically. About three-fifths of the total is sold packaged, the rest in bulk; the meat trade takes about one-half of the bulk volume. (J. K. R.)

Squash Racquets.

G. Diehl Mateer, Jr., of Philadelphia, Pa., retained top ranking among United States amateur stars following his conquests of the 1954-55 season. Mateer gave one of his best performances in the final of the national open championship on the courts of the University club (New York city) when he routed Azam Khan of Pakistan, 15-9, 15-5, 15-10, on Jan. 3. Earlier in the competition, Khan had eliminated Henri Salaun of Boston, Mass., the defending titleholder. Mateer again opposed Azam Khan in the Canadian open final at Toronto, Ont., on Jan. 9 at the Badminton and Racquet club and triumphed, 11-15, 15-11, 13-15, 15-10, 15-10. Mateer also won the Canadian amateur crown, turning back Salaun in a hard-fought battle at Montreal, Que., on Feb. 6 by scores of 15-7, 15-9, 15-16, 12-15, 15-7. The Philadelphian, however, relinquished his national amateur laurels when he lost to Henry Foster of Boston in the quarter-final round at Detroit, Mich., Feb. 12. Salaun came through on top in that tournament when he conquered Ernie Howard of Toronto in the last round on Feb. 13 by 15-7, 15-6, 15-11. Hashim Khan captured British open honours for the fifth straight season by halting his brother Azam, 9-7, 7-9, 9-7, 5-9, 9-7, and gained American professional laurels by beating Azam, 15-11, 11-15, 14-16, 15-6, 15-7, at the New York Athletic club on Feb. 13.

Janet Morgan of London set a record for English women players when she captured the British championship for the sixth consecutive time. She defeated Mrs. Ruth Turner of London, 9-5, 9-3, 9-6, on Dec. 11, 1954. Miss Morgan added the U.S. title to her collection by subduing Mrs. Robert White, Rochester, N.Y., 17-16, 15-9, 15-12, at the Merion Cricket club in Haverford, Pa., on Feb. 26. She also shared in the doubles title, pairing with Sheila Speight, Cheltenham, Eng., to conquer Mrs. John Carrott, Greenwich, Conn., and Mrs. Hilda Smith-Peter-son, Boston, 15-8, 15-11, 15-8.

Roger Campbell of Princeton retained the National Intercollegiate Squash Racquets association crown by halting Harvard's Ben Heckscher at Annapolis, Md., in March.

In the Wolfe-Noel cup matches, Miss Morgan led the British women to a 4-1 victory over the U.S. at the Merion Cricket club on Feb. 27. In these matches, Rosemary Walsh, Birmingham, defeated Mrs. Carrott, 15-11, 12-15, 15-9, 15-9; Mrs. L. Clement, Philadelphia, defeated Mrs. Jennifer Pendered, London, 16-15, 11-15, 15-16, 15-9, 18-14; Miss Speight defeated Mrs. Nathan Stauffer, Philadelphia, 9-15, 15-6, 15-7, 16-13; Mrs. Turner defeated Lois Dilks, Philadelphia, 13-15, 15-6, 13-15, 18-14, 15-9, and Miss Morgan defeated Mrs. White, 15-9, 15-8, 15-12.

Standards, National Bureau of.

Established by act of the United States congress, March 3, 1901, the national bureau of standards has basic responsibility for research, development, testing, calibration, specifications and scientific services in physics, mathematics, chemistry, metallurgy and engineering. During 1955 it consisted of 16 scientific and technical divisions (electricity and electronics, optics and metrology, heat and power, atomic and

GUESTS attending a lecture and demonstration at the high voltage laboratory of the National Bureau of Standards during an open house held in Feb. 1955

radiation physics, chemistry, mechanics, organic and fibrous materials, metallurgy, mineral products, building technology, applied mathematics, data processing systems, cryogenic engineering and three radio propagation divisions), 4 offices (basic instrumentation, weights and measures, publications and technical information) and 10 administrative divisions. The total staff was more than 2,600, of which the majority were stationed at the bureau's principal laboratories in Washington, D.C., and Boulder, Colo. Twenty field stations were also maintained in the United States and abroad.

During the year, two new determinations of the velocity of light were made by the bureau's scientists. Although carried out independently by widely different methods, the two determinations gave precise values that were in close agreement. They also provided confirmation for the higher values of electromagnetic wave velocity (average value, $299,793 \pm 1$ km./sec.) that had been consistently obtained by microwave measurements since World War II. In one method, the velocity of light was determined from measurement of the molecular constants of carbon monoxide by infra-red spectroscopy. The other determination made use of phase-shift measurements on very high frequency radio waves to obtain their velocity of propagation. Before World War II, the value $299,776 \pm 4$ km. per second was generally accepted as an average. The results obtained by the bureau gave $299,792 \pm 6$ km./sec. by the molecular constants method and $299,795.1 \pm 3.1$ km./sec. by the radio interferometer.

Advances were also made in the field of radiation standards. Two devices were developed that precisely measure radiation in terms of the heating effect it produces. One of these, a radiation-balance microcalorimeter, was expected to aid materially in meeting the increased demand for calibration of radioactive sources. The other, an X-ray calorimeter, would serve as a basic standard for measurement of the high-energy X-rays now being used in medical treatment and industrial radiography. To meet the increasing demand for standard samples of radioactivity, a radiochemistry laboratory was established. The new laboratory would prepare and distribute approximately 57 different radioactive nuclides and ores to hospitals, research laboratories and industrial plants.

In studies of the basic properties of materials, increased emphasis was placed on those inorganic materials that are stable at very high temperatures. Data on such materials were required

for further advances in atomic power plants, high-speed missiles and jet aircraft, but information on their high-temperature behaviour had been lacking. In one project, the high-temperature reactions of uranium dioxide with other refractory compounds were studied to provide information essential to the design of nuclear reactors for operation at higher temperatures than were being used. Another project investigated various types of high-temperature concretes to obtain materials for jet aircraft aprons that would withstand high and fluctuating temperatures. The properties of cermets—heat-resistant ceramic-metal combinations—were studied in connection with their use in critical components of jet engines, rocket motors and ordnance devices. Vitreous ceramic materials were also investigated to obtain insulating coatings for electronic instrument components and wiring used at high temperatures. Studies showed that under proper conditions ceramic coatings can substantially reduce the creep rate of high-temperature alloys. Other work in this general area dealt with diffusion of gases in glasses, phase equilibria of refractory materials and thermal decomposition mechanisms of inorganic materials.

The year saw a data-processing systems laboratory established as a separate division of the bureau. Combining the work in electronic digital computers with a program in analogue computer technology, the new division carried on research, development and systems design and analysis in these fields. It also provided technical advisory services to other government agencies on the use of high-speed computing techniques in new areas of potential application—such as massive paper-work operations, automatic control systems and simulation—as well as in the solution of specific technical problems.

Of broad industrial interest was a study of electronic circuits undertaken for the navy bureau of aeronautics. Results showed the feasibility of standardizing many of the electronic circuits used in navy aeronautical equipment. Known as the NBS-BuAer preferred circuits program, this continuing investigation sought to determine those well-known circuit configurations that are common to a wide variety of electronic devices but which differ unnecessarily in detail. A number of preferred circuits were selected and prepared for joint national bureau of standards-navy publication as a manual for design engineers.

Approximately 174,000 items were calibrated or tested for the public and the government during the year. In addition, about 32,500 standard samples of certified chemicals, metals and alloys were issued. Typical services included the following calibrations and tests: 694 standard cells, 994 water-current meters, 757 hydrometers, 839 radium sources, 491 radioactive cobalt sources, 2,400 dilution pipettes, 33,110 clinical thermometers and the sample testing of 3,000,000 lamps and 15,000,000 bbl. of cement.

Results of the bureau's work are available through three monthly periodicals (*Journal of Research*, *Technical News Bulletin* and *Basic Radio Propagation Predictions*) and a series of nonperiodical publications. An indexed list of publications ("Publications of the National Bureau of Standards," *Circular 460* and *Supplement*) is available from the superintendent of documents, U.S. government printing office, Washington 25, D.C. (W. R. BR.)

Stars: see ASTRONOMY.

Stassen, Harold Edward (1907–), U.S. government official, was born on April 13 at West St. Paul, Minn. He received his bachelor's degree from the University of Minnesota, Minneapolis, in 1929, and his law degree there the same year. In 1930 he was elected county attorney, holding the post for eight years, then was

elected governor of Minnesota on the Republican ticket in 1938. He was re-elected in 1940 for a second term but resigned in 1943 to join the U.S. navy.

Stassen was a candidate for the Republican presidential nomination in 1944 and again in 1948 but lost on both occasions to Thomas E. Dewey. After the 1948 convention he accepted the presidency of the University of Pennsylvania, Philadelphia. On Nov. 21, 1952, Pres. Dwight D. Eisenhower named Stassen director of the Mutual Security agency, and he was confirmed by the U.S. senate on Jan. 27, 1953. (The Mutual Security agency was reconstituted as the Foreign Operations administration later that year.) During 1953 Stassen made extended tours through Europe, Africa and Asia, later urging that the U.S. step up military and economic aid to the free nations of those continents. In 1954–55 his attention was largely focused on economic aid to the non-communist nations of Asia. The F.O.A. went out of existence June 30, 1955, and its functions were taken over by the new International Cooperation administration; but Stassen remained as F.O.A. administrator until then. Meanwhile, on March 19, 1955, Pres. Eisenhower appointed Stassen to the new office of special presidential assistant for disarmament, with cabinet rank. On Aug. 30 Stassen presented to the UN subcommittee on disarmament the essence of Eisenhower's Geneva "mutual inspection" plan as the proposed basis for a U.S.-soviet treaty on disarmament.

Stevenson, Adlai Ewing (1900–), U.S. political figure, was born at Los Angeles, Calif., on Feb. 5. He was graduated from Princeton university in 1922, subsequently earning his law degree at Harvard and Northwestern university, Evanston, Ill. After serving abroad as a newspaper correspondent, he became a federal official, principally with the agriculture, state and navy departments. He was governor of Illinois 1949–53, and was the Democratic nominee for president in 1952. Carrying only nine states, he was defeated on Nov. 4 by Dwight D. Eisenhower.

Stevenson announced on Nov. 15, 1955, that he would be a candidate for the presidential nomination in 1956. Stevenson explained that he had decided to stand for renomination before President Eisenhower fell ill, and that his decision had not been influenced by the fact that Eisenhower's possible retirement from politics may have brightened the Democrats' chances for 1956. He said that he would enter numerous primaries, where his principal opponent was expected to be Sen. Estes Kefauver of Tennessee.

In numerous speeches at \$100-a-plate dinners, which helped to pay off the party deficit his 1952 campaign had incurred, as well as in his Nov. 15 press interview, he outlined the kind of attack he would make on the administration's domestic and foreign policies.

The Democratic party, he said, must stand for three main principles: social progress, civil freedom and peace. He criticized the administration for not spending enough money on health and education, and for what he feared was a dissipation of natural resources for the benefit of the few rather than the many. He referred to the Eisenhower regime as a "special interest government" that offered only a "shaky peace, deceptive prosperity and no progress."

Although he praised Eisenhower's participation in the Geneva conference of the heads of the Big Four Powers on the ground that "after three years of a 'get tough' policy, it proved that, contrary to many people's belief, the United States was not more of a threat to peace than the Russians," he expressed dissatisfaction with the results. He declared that the "cold war is still in a deep freeze," with the free nations' security system "deteriorating," and a "safe and orderly world still a distant goal." He also expressed alarm over Washington proposals to curtail funds for national defense when world conditions were so "acute."

Besides making numerous political speeches, Stevenson delivered a series of lectures at Northwestern university law school and the University of Texas, Austin. He vacationed in Jamaica in February, visited South Africa on business in April-May and journeyed to Haiti and Jamaica in September. (See also ELECTIONS, U.S.; POLITICAL PARTIES, U.S.) (R. TU.)

Stocks and Bonds. **U.S. Stocks.**—The bull market, which began to develop momentum at the beginning of 1954, continued to push forward throughout the greater part of 1955. Measured by Standard and Poor's composite index of 90 stocks, as shown in Table I, U.S. common stock prices rose with minor interruptions to the highest levels on record during Sept. 1955. During the first nine months of 1955 the composite index registered a gain of more than 22.6%.

Industrials led the advance with a gain of 25.8%. Railroads and public utilities followed with price index rises of 10.6% and 5.8%, respectively. The Dow Jones averages and the Securities and Exchange commission index of stock prices lend confirmation to the magnitude of the boom.

The average yield on common stocks, which had been declining since Sept. 1953, continued to slide downward until Sept. 1955 when it reached a new low of 3.75%. Of the 964 dividend-paying common stocks listed on the New York Stock exchange at the beginning of Sept. 1955, 144 were selling to yield less than 3%. Of the remaining 820, there were 190 yielding between 3% and 4%, 288 yielding between 4% and 5%, 201 yielding between 5% and 6% and 90 yielding 6% to 7%. Only 35 common stocks on the New York Stock exchange were paying between 7% and 8% and only 16, or 1.6%, were returning more than 8%. By way of contrast, at the end of 1953 28% of all dividend payers were yielding 8% or more. The spread between corporate bond yields and common stock returns became smaller in Sept. 1955 than at any time since the late 1920s.

The total number of shares traded on all registered exchanges in the United States, as reported by the Securities and Exchange commission, was 728,917,000 during the first six months of 1955. This represented a gain of 22.5% over the 594,635,000 aggregate trading volume established during the latter half of 1954. Expressed in terms of market values, the trading in the first half of 1955 amounted to \$20,415,000,000, an increase of 24% as compared with \$16,455,000,000 worth of shares sold during the second six months of 1954.

During the first nine months of 1955 the volume of trading on the New York Stock exchange was the highest in more than two decades. The 507,920,118-share turnover represented an increase of 30.6% over the number of shares traded in the comparable period of 1954, and 90% over 1953. On Sept. 26, 1955, the

SALES AND PRICES on the New York Stock exchange, 1955

market reacted violently to the news of Pres. Dwight D. Eisenhower's heart attack, and 7,720,000 shares were traded in a single day. Trading volume continued at an abnormally high level during the early part of Oct. 1955.

U.S. Bonds.—United States government long-term bond prices, according to Table II, reached a peak of 107 in July 1954 and thereafter declined steadily to a level of 101 in Aug. 1955. While the downtrend was interrupted during March and May, the price of long-term governments fell about 3.3% during the first eight months of 1955 to the lowest level in two years. Corporate bonds with A1+ ratings, as shown in Table III, observed the same pattern as that of long-term governments; i.e., their prices achieved a high of 117.8 in the midsummer of 1954 and thereafter fell month by month to a low of 113.2 in Sept. 1955.

Bond yields revealed the customary inverse correlation with prices and rose irregularly from mid-1954 until Sept. 1955. During the first nine months of 1955 the yields on high-quality corporate bonds increased from 2.896 to 3.107, a gain of 7.2%. Long-term government bonds registered a gain of 8.2%, rising somewhat unevenly from 2.65 to 2.87 during the same period.

The market value of bond sales, exclusive of United States government bonds, on all registered exchanges in the United States during the first half of 1955 increased by less than 1% over the corresponding values for the second half of 1954. In absolute terms, bond sales rose from \$561,920,000 in the last half of 1954 to \$567,256,000 in the first half of 1955.

There was a modest decrease in the total market values of all bond issues listed on the New York Stock exchange during the first six months of 1955 according to the U.S. department of commerce. At the end of June 1955, aggregate bond market values were \$104,282,000,000, comprising \$102,181,000,000 in domestic issues and \$1,443,000,000 in foreign. These figures are comparable with the 1954 year-end statistics of \$106,517,000,000 for all bond issues combined, consisting of \$104,442,000,000

domestic and \$1,403,000,000 foreign. The apparent discrepancies in total market values arise from the omission of bonds of the International Bank for Reconstruction and Development.

Market Conditions.—The security markets at the end of the third quarter of 1955 had shown substantial gains in the prices of stocks as compared with the same period in 1954. However, a number of significant changes occurred during 1955 which had a dampening effect on the speculative enthusiasm of many investors.

Margin requirements were raised from 50% to 60% in Jan. 1955 and from 60% to 70% in April, as the federal reserve board attempted to put a rein on the volume of stock market credit. Credit was tightened as well by other policies of the government. The discount rate charged on member bank loans from the federal reserve banks was raised from 1.5% to 1.75% in April 1955, and subsequently it was raised to 2% with the Cleveland and regional bank establishing a rate of 2.25% on its loans. The treasury department continued its policy of selling long-term bonds with the consequence of tighter bank credit. Most banks tended to become more selective in granting loans, and loan rates increased. Mortgage credit was severely curbed in Aug. 1955 when the provisions for down payments and maximum terms on Federal Housing administration and Veterans administration loans were revised. Where formerly there were no down payments required on VA loans and terms up to 30 years were available, the new regulations provided for a minimum down payment of 2% and a maximum term of 25 years. Under FHA rules, maximum terms were likewise reduced from 30 years to 25 years, and down payments were increased from 5% of the first \$9,000 of appraised value to 7%, and from 25% of the excess over \$9,000 to 27%. The combined effect of these credit restricting measures indirectly served to boost bond yields to the point where the relative yield advantage enjoyed by equities had become unusually small.

Despite the small margin between stock and bond yields, the price-earnings ratios of industrial shares during the 12 months ending Sept. 1955 were far more conservative than those prevailing in past market peaks. Another significant factor which might be expected to grow in importance, and which was beginning to be discounted by the market during 1955, was the impending end of the heavy charges for accelerated amortization of defense facilities which imposed a burden on current earnings in a number of important industries.

New York Stock Exchange.—The operations and practices of the New York Stock exchange came under close scrutiny in 1955 as a result of a series of hearings conducted by the U.S. senate committee on banking and currency. While the primary object of the Fulbright committee was to determine whether federal regulation of stock market activity was adequate, the attendant publicity served to focus the attention of the public

"CONGRESSIONAL JUNKET," a 1955 cartoon by Pletcher of the *Sioux City Journal* (la.)

on the effectiveness of the New York Stock exchange's internal regulation. The exchange emerged from these hearings with a clean bill of health.

During the first half of 1955 the Monthly Investment plan, which was designed to attract the small investor, seemed to be taking hold satisfactorily. During the first six months of 1955 more than 15,000 plans were sold as compared with approximately 29,000 plans sold in 1954. More than 80% of the new plans provided for plowing back dividends into capital accounts.

(See also FOREIGN INVESTMENTS; SECURITIES AND EXCHANGE COMMISSION.) (I. Pr.)

Great Britain.—The year 1955 was divided into two more or less equal sections, so far as United Kingdom stock markets were concerned. During the first half of the year the general trend of industrial ordinary share prices was sharply upward, and during the second half there was an equally sharp decline. Industrial ordinary shares, which had risen almost without a pause during 1954, made an equally promising start in 1955. On Jan. 10, 1955, the London Stock exchange experienced one of its most active trading sessions ever, when at 18,836 the number of bargains marked reached the highest level since the 19,438 recorded on Jan. 20, 1947, just after the culmination of the postwar bull market.

Soon, however, came the first warning that all was not entirely sound in the U.K. economy. On Jan. 27 the bank rate was raised by 0.5% to 3.5%, thus restoring the rate to the level from which it was reduced in May 1954; this was the government's first dearer money move since the bank rate was raised from 2.5% to 4% to meet the economic crisis of 1951-52. But the *Financial Times* industrial ordinary share index, after a very modest setback on the news, went on advancing to a peak of 197.5 on Feb. 3.

International uncertainties were the immediate cause of the first reaction from this peak—with the industrial ordinary yield

down to 4.31% prices were vulnerable to any bad news—and these were followed by fears of a further increase in the bank rate, which proved well founded, for on Feb. 24 came the news that the bank rate was raised by a further 1% to 4.5% and the announcement of the reimposition of instalment credit restrictions. Share prices slumped sharply on this news, rallied for several days and fell away to a low point of 175.7 for the *Financial Times* industrial ordinary index on March 15.

From that low point a recovery developed, which carried on until the budget on April 19, and though market views were that, with its tax concessions, the budget was a good one, there was some setback in prices because the general election date of May 26 was approaching so close. In their traditional role of discounting the news, however, markets began to move up again at the beginning of May, and the initial advance, proving justified by the election of a Conservative government for a further five years, was followed by a strong upward movement, with steel shares particularly prominent, thanks to the disappearance of the threat of renationalization.

The general optimism swept the *Financial Times* industrial ordinary index up to an all-time peak of 223.9 on July 21—no less than 27% above the low point touched only four months earlier and 118% above the point at which that particular bull market started in June 1952—and that was the top.

The three-year advance in equity share prices had been, on the whole, very well based; for it did little more than bring share values more into line with the huge appreciation there had been in the value of the underlying assets of the businesses concerned, largely because of inflation. The immediate cause of the advance, moreover, was the rises in industrial profits during 1954 and 1955 and the much more liberal distribution policies followed by boards of directors, which resulted in an increase of more than one-fifth in dividend payments in each year.

But, as with all booms, in the latter months hopes tended to outrun performance, so that at the peak investors were willing to accept a yield of no more than 4.28% on the *Financial Times* industrial ordinary index. With the yield on consols at the same date as high as 4.23%, the traditional differential between equity yields and gilt-edged yields had virtually disappeared, and markets were in a very vulnerable position.

With intermittent rallies ordinary shares declined until the beginning of October, when the *Financial Times* industrial ordinary index touched a low point of 181.1 on Oct. 10, or 19%

below the peak. From that point a recovery developed, helped by the improvement that had begun around the beginning of September in gilt-edged prices, on the view that with gilt-edged prices at their lowest levels for around 30 years they were certainly historically cheap and worth acquiring on a long-term investment basis.

November brought a renewed setback in gilts, however, on the news that the credit squeeze was to be continued into 1956, and equities also reacted once again. Thus the year ended with brokers sharply divided about both the immediate position and prospects. Some considered that after their setback ordinary shares were on quite a reasonable yield basis for investment purposes, while others believed that the effects of the government's measures to curb inflation would be much severer than many persons had imagined and that even at their relatively depressed levels ordinary shares were still not adequately discounting the uncertainties. (E. Mt.)

Stomach and Intestines, Diseases of the.

Oesophagus.—Reflux of hydrochloric acid from the stomach to the oesophagus was demonstrated in approximately 50% of persons troubled by heartburn. Belching was a common symptom, the frequent eructations of gas presumably facilitating backflow of acid and irritation of the oesophagus.

Hiatus hernia, a protrusion of the stomach through the oesophageal opening in the diaphragm, frequently does not produce symptoms and is detected only by routine X-rays of the upper digestive tract. Occasionally, hiatus hernia caused heartburn, discomfort in the chest and upper abdomen, difficulty in swallowing and bleeding. The hernia was attributed to relaxation of supporting structures. Treatment included weight reduction, small meals, antacids and avoidance of tight corsets and belts or strenuous physical activity; surgery was necessary infrequently for large, fixed hernias and for recurrent bleeding. In children, the cause usually was a developmental defect of the diaphragm, permitting the stomach to enter the left chest; surgical repair was needed to relieve compression of the heart and lung.

Stomach.—Many additional drugs were available in 1955 for suppressing acid production in the treatment of peptic ulcer. A new compound, acetazoleamide, lowered acidity after intravenous injection; this medication, though itself not suitable for routine use, suggested the possible development of more effective antacid drugs. Antirheumatic medicines, including salicylate and phenylbutazone, irritated the stomach, increased the acidity and caused the formation or reactivation of peptic ulcer, with haemorrhage and perforation.

Vagotomy with gastroenterostomy or haemigastrectomy was advocated by more surgeons in the operative treatment of duodenal ulcer and of jejunal ulcer complicating partial gastrectomy. Whereas simple closure had been the usual treatment of ruptured ulcers, partial gastrectomy now was recommended especially for perforations of gastric ulcer and for patients with chronic recurrent duodenal ulcer with perforations less than eight hours old; the mortality was not excessive; the incidence of complications and duration of hospitalization were reduced.

The relatively high incidence of cancer of the stomach among Japanese, 35 per 100,000 population compared with 18 per 100,000 in the United States, presented an unexplained problem. Increased frequency of the disease in relatives of patients with gastric cancer and its occurrence occasionally in identical twins suggested an inherited predisposition. Patients with pernicious anaemia and with little or no hydrochloric acid in the stomach were more susceptible than the general population. Examination of these cancer-prone individuals with various laboratory

ests, X-rays and study of cells from the stomach, utilizing a new enzyme, chymotrypsin, facilitated earlier diagnosis of cancer and other tumours, such as lymphoma, responding more favourably to surgery and irradiation. The prognosis of gastric cancer depended upon its extent and the presence and location of metastases, factors determining the possibility of complete surgical removal. The mortality rate of surgery decreased considerably despite more frequent and extensive operations. Since complete gastrectomy was ineffective for tumours extending beyond the stomach and since this operation accounted for most operative failures, subtotal resection was preferred, except in special circumstances.

Intestines.—The importance of careful bacteriological examination of the faeces of patients with diarrhoea was re-emphasized in the frequent occurrences of *Salmonella* infections. Epidemics of diarrhoea in nurseries of premature and newborn infants were traced to *Escherichia coli* 0-111, B₄ and to *Escherichia coli* 0-127, B₈; the organisms were sensitive to various antibiotics. Active amoebic infections were treated simultaneously with several medications; those most effective for amoebiasis in tissues were chloroquine, emetine and quinacrine; for the bowel, arsenicals (carbasone, milibis, thiocarbasone), iodoquinoline compounds (chinfofon, diiodohydroxyquinoline) and antibiotics (chlortetracycline, oxtetracycline, bacitracin, neomycin and fumagillin).

Acute haemorrhagic inflammation of the small and large intestine developed in elderly people with chronic heart disease, as a result of the breakdown of congested, oxygen-deficient intestinal capillaries. A similar process could be produced experimentally by the clotting of blood within capillaries of the intestinal mucosa. The principal symptoms were diarrhoea, often bloody, severe abdominal pain and distension. Treatment was primarily supportive. A severe, at times fatal, enterocolitis was caused by increased growth of staphylococci during antibiotic therapy. The chief symptoms were intense diarrhoea, dehydration, fever and shock. Treatment included erythromycin to destroy the staphylococci and administration of fluids and minerals.

The irritable colon, a common disorder, usually is caused by emotional tension, improper diet, irritating drugs or excessive laxatives. Prolonged use of irritant cathartics containing aloin and podophyllum caused extensive dilatation and atony of the colon and occasionally changes resembling ulcerative colitis. Acute intestinal infections also produced irritability of the large bowel after the infection had subsided; symptoms included abdominal pain, flatulence and recurrent diarrhoea. Bowel spasm and loss of normal reflex response to defaecation resulted in constipation. Treatment included bland foods, avoidance of laxatives and other irritants, adequate intake of water, sedatives and antispasmodics.

Most patients with ulcerative colitis could be maintained in satisfactory health by comprehensive and prolonged medical management; surgery was required in 10% to 15% of the cases. The preferred operations were total colectomy and ileostomy, and for regional colitis, segmental resection of the bowel with ileosigmoidostomy or ileocolostomy. While surgery was highly effective and, at times, lifesaving, the numerous complications, locally and systemically, limited operation to problems such as obstruction, perforation, polyps, carcinoma, extensive perianal infection, severe arthritis and cirrhosis of the liver. A new type of ileostomy was devised to permit proper function of the ileostomy, protecting against local inflammation and preparing the ileostomy for prompt application of a leak-proof appliance.

Liver.—Hepatitis, an inflammatory virus disease of the liver, may occur at any time of the year and at all ages. In hepatitis affecting children at birth, the virus of serum jaundice was the

infectious agent, apparently transmitted through the placental barrier by mothers who were symptomless carriers. In children, acute hepatitis did not always produce jaundice, a characteristic sign of the disease. Symptoms included lassitude, poor appetite, failure to gain weight, fever, loose, light-coloured stools and vomiting; the liver was enlarged and tender. Most infants and children recovered completely, without permanent liver damage. Treatment was supportive, including moderate bedrest, a palatable diet high in protein and carbohydrate, with added vitamins. ACTH and cortisone were not helpful, except perhaps in a few cases of severe or relapsing hepatitis. Symptomless carriers were responsible for continued transmission of the disease. In serum hepatitis, prevention of further spread of the virus necessitated scrupulous sterilization of needles, syringes and instruments, avoiding unnecessary use of blood or blood products and techniques inactivating or eliminating the virus from the blood. Current methods for this latter purpose included ultra-violet irradiation, storage of plasma at room temperature and the use of beta-propiolactone; over a three-year period 241 patients received 787 transfusions of plasma treated with this latter material without evidence of toxicity or serum hepatitis. An unusual type of hepatitis, with features suggesting obstruction to bile flow, developed infrequently during the use of chlorpromazine, a drug prescribed for anxiety, tension and nausea. The illness extended for several days to several months; recovery usually was complete.

Gall Bladder.—Cholecystitis (inflammation of the gall bladder) was one of the more common causes of acute abdominal disease in the postoperative period, after unrelated surgery. Angina pectoris was not a contraindication to removal of the gall bladder for gallstones, unless the heart disease was so advanced that operative risk exceeded the possibility of benefit.

Pancreas.—Diagnosis of acute pancreatitis was aided by elevated antithrombin activity in plasma, reflecting the release of increased amounts of trypsin. Surgery was indicated only for an associated cholangitis or obstruction of the common bile duct. Medical treatment included the use of albumin, to maintain normal plasma volume. The outcome depended upon the extent of the destruction of the pancreas.

Early diagnosis of cancer of the pancreas continued to be extremely difficult; the output of enzymes in response to secretin, and examination of pancreatic cells, recovered in the duodenal contents, occasionally facilitated the diagnosis. Many surgical procedures were available for pancreatic tumours; however, radical operation was not attempted, except in limited growths with increased prospects of surgical cure. The size of pancreatic cancers could be reduced by radioactive iodine introduced through fine polyethylene tubing threaded around and through the growth; as much as 9,000 r of radiation could be administered internally by this technique. Strawberries: see FRUIT.

Strikes. **United States.**—Fewer work stoppages (strikes and lockouts) occurred in 1954 than in any year since World War II with the exception of 1948; and fewer workers and man-days of idleness were involved in work stoppages in 1954 than in any year since 1945. Compared with 1953, there was a decline of 20% in the number of man-days idle (a reduc-

tion from 28,300,000 in 1953 to 22,600,000 in 1954), a 36% decline in the number of workers involved in stoppages (a reduction from 2,400,000 in 1953 to 1,530,000 in 1954) and a 32% decline in the number of work stoppages (a reduction from 5,091 in 1953 to 3,468 in 1954). In 1954 the number of man-days idle was 0.21% of the estimated working time of all workers—the lowest percentage since 1945.

The declines in the number of work stoppages, workers involved and man-days idle failed to continue into 1955. The number of stoppages beginning during the period January–May 1955 was 1,475 compared with 1,439 for the comparable period in 1954. Similarly, a 21% rise occurred in the number of workers involved in strikes beginning during the period, and the number of man-days idle rose by 17%. There were 564,000 workers involved in strikes beginning during the January–May period in 1954 and 6,626,000 man-days of idleness during this period. In the January–May period in 1955, the number of workers involved rose to 685,000 and the man-days of idleness increased to 7,770,000.

Approximately half of the number of work stoppages and workers involved in work stoppages that began in 1954 occurred in the manufacturing industries. However, these industries accounted for 61% of the man-days idle during 1954. Work stoppages in the lumber and wood products (except furniture) industry were responsible for 31% of the man-days idle in the manufacturing industries. Similarly, work stoppages in the construction industry were responsible for 54% of the man-days idle in the nonmanufacturing industries during 1954.

Wages, hours and supplementary benefits were the major strike issues in almost half of the 3,468 work stoppages that began in 1954. Forty-three per cent of these stoppages involved disputes over wage decreases. Twenty-four per cent of the work stoppages that began in 1954 featured disputes over working conditions as their major issue. The remaining work stoppages were principally concerned with the issues of union organization (12%), interunion or intraunion matters (7%) and union organization, wages, hours and supplementary benefits (5%). The major strike issues were not reported in 2% of the work stoppages.

Unions affiliated with the American Federation of Labor were involved in 61% of the strikes that occurred in 1954. These strikes accounted for 46% of the total number of workers involved and 41% of the man-days of idleness. Unions affiliated with the Congress of Industrial Organizations were involved in 22% of the strikes. These strikes accounted for 31% of the total number of workers involved and 30% of the man-days of idleness during 1954. About 14% of the stoppages, with 16% of the workers and 11% of the man-days of idleness, involved unions that were not affiliated with either the A.F. of L. or C.I.O. Many of these strikes were short, localized stoppages in the coal-mining industry. (P. TA.)

Major U.S. Strikes.—Although a number of notable strikes occurred during 1955, in no instance did the White House deem

Table II.—United States: Work Stoppages by Industry Group

*The sum of the figures in this column exceeds 3,468 because a few stoppages extending into two or more industry groups have been counted in this column in each industry group affected; workers involved and man-days idle were divided among the respective groups. †In this and subsequent tables, the sum of the individual items may not equal the total for the group because of rounding the individual figures. ‡Less than 0.05%. §Not available. ||Municipally operated utilities are included under "Transportation, communications and other public utilities."

Source: United States Bureau of Labor Statistics, *Monthly Labor Review*.

that the national health and safety were threatened. There was no consistent pattern to these work stoppages, and the key issues varied from industry to industry. A small proportion of the strikes were accompanied by violence.

Two strikes in the southeast attracted national attention. One, by the Communications Workers of America against the Southern Bell system, involved about 50,000 workers and lasted 72 days. It was accompanied by numerous incidents of violence and property damage. The union demanded that the agreement which contained a no-strike, no-lockout clause, also provide for arbitration of any disputes arising during the term of the agreement which the parties would not decide themselves. The company insisted on retaining final decision in disputes involving benefit plans, leave of absence and compliance with health and safety measures. Wage issues were also involved in the dispute. Both sides claimed partial victory when the strike was settled. The company filed a \$5,000,000 suit for property damage against the union after the strike settlement.

The other large strike in the south found ten A.F. of L. union representatives about 25,000 nonoperating employees, including telegraphers, clerks, track crews and shop crafts, refusing to work at the Louisville and Nashville railroad (L. & N.) in the southern states for 59 days. Most of the railroads in the country had in 1954 accepted a presidential emergency board recommendation calling for a health insurance program financed jointly by the workers and carriers. The L. & N. refused to accept the same terms; it favoured the continuance of its own voluntary insurance system, opposing the other programs on the

Table I.—United States: Work Stoppages, Workers Involved and Man-days Idle

Year	Number of work stoppages	Number of workers involved	Man-days idle during year	Man-days idle as a per cent of estimated working time of all workers
1935–39 (av.)	2,862	1,130,000	16,900,000	0.27
1945	4,750	3,470,000	38,000,000	0.47
1946	4,985	4,600,000	116,000,000	1.43
1947	3,693	2,170,000	34,600,000	0.41

round that workers were compelled to contribute to it. The strike ended when the parties agreed to submit their differences to arbitration.

The referee ruled that the L. & N. should pay the full costs of the same health and welfare plan which was paid for jointly by workers and railroads elsewhere. The arbitrator stated that his decision was based upon the company opposition to forcing employees to contribute to the health and welfare plan and the general trend toward plans financed entirely by employers. Before the arbitrator had issued his decision, the nonoperating unions had demanded that all carriers assume the burden of the total costs of their health and welfare plan.

A 13-week strike of the C.I.O. Textile Workers union in New England was prompted by an employers' demand that the workers accept a ten-cent "package" cut. The final settlement called for the continuance of wages and working conditions as they existed prior to the strike.

Labour unrest continued to plague the New York city waterfront. In September the International Longshoremen's association, which had been expelled from the A.F. of L. the preceding year, called a strike in protest against the Waterfront commission. This commission controlled work permits for longshoremen on the New York-New Jersey water front, and had denied permits to several hundred longshoremen who had criminal records.

The I.L.A. tried to extend the strike to the whole east coast, apparently in the effort to obtain governmental intervention and overruling of the commission's policy. However, the governors of New York and New Jersey refused to interfere with the commission's activities. The I.L.A. called off the strike when a New Jersey state senator organized a "citizens committee" to hear the alleged grievances of the union against the commission. One of the most prolonged and violent strikes in recent labour-management disputes occurred at Kohler, Wis. The strike, which started in April 1954, involved the United Automobile Workers and the Kohler company, a producer of plumbing fixtures. After a brief shutdown the company resumed oper-

TRAFFIC JAM IN WASHINGTON, D.C., during the transit strike of 1955. Because of the great increase in automobile traffic, motorists were permitted to park on the trolley tracks in the centre of Pennsylvania avenue

*Some workers, largely in the coal-mining industry, were involved in more than one stoppage and are counted more than once in the totals. The net number of individuals involved in coal-mining stoppages in the period under review in 1955 was approximately 88,000, and in the corresponding period in 1954 was approximately 92,000. For all industries combined the corresponding net totals were approximately 362,000 and 77,000. †Less than 50 workers or 500 working days. ‡A stoppage of electricians which began in April 1954 involved workers in more than one industry group but was counted as only one stoppage in the total for all industries taken together.

Source: Ministry of Labour Gazette.

ations, employing some old and many new workers. The dispute was punctuated by numerous outbursts of violence. The basic issue in the strike appeared to be that of union security, which the company refused to grant. The length and bitterness of the strike and the widespread publicity given to arguments of "principle" attracted nation-wide attention. Appeals to secure White House intervention were rebuffed on the basis that the strike did not involve any threats to national health and safety. An unusual attempt by members of the U.S. senate to act as mediators in the strike was rejected by the company spokesman. The U.A.W. was alleged to have spent in excess of \$5,000,000 in support of the strike. (S. A. LN.)

United Kingdom.—The number of work stoppages arising from industrial disputes in the United Kingdom that began during the year rose by 14% from 1,746 (1953) to 1,989 (1954). Similarly, the aggregate number of working days lost during the year in stoppages rose by 13% from 2,157,000 (1953) to 2,441,000 (1954). On the other hand, the aggregate number of workers involved in stoppages which began during the year declined from 1,370,000 (1953) to 448,000 (1954).

The two principal causes of the disputes which led to work stoppages in 1954 were wage disputes and disputes over other working arrangements, rules and discipline. The former accounted for 47% of the stoppages and 39% of the workers directly involved in stoppages beginning in 1954. The latter issue accounted for 37% of the stoppages and 28% of the workers directly involved.

The largest number of stoppages of work arising from indus-

Source: Dominion Bureau of Statistics, Canadian Statistical Review.

trial disputes in 1954 occurred in the coal-mining industry. These stoppages accounted for about 20% of the total loss of time in 1954 and for about 40% of the total number of workers involved in all stoppages in the year.

A comparison of the first halves of 1954 and 1955 revealed substantial increases in the time lost in all stoppages (692,000 working days in the first half of 1954 to 2,795,000 in the first half of 1955) and in the number of workers involved (205,100 to 436,000). The total number of stoppages beginning during the period rose to a lesser extent, from 1,060 (first half of 1954) to 1,205 (first half of 1955).

Canada.—In Canada the number of strikes and lockouts commencing during the period decreased from 174 in 1953 to 168 in 1954, and from 46 in the first quarter of 1954 to 27 in the first quarter of 1955. Nevertheless, the number of workers involved in the strikes commencing during the period and the time lost in man-days continued to increase. The number of workers involved in strikes increased from 55,988 in 1953 to 61,477 in 1954, and from 12,607 in the first quarter of 1954 to 12,974 in the first quarter of 1955. Similarly, the time lost in man-working days rose from 1,324,715 in 1953 to 1,472,160 in 1954, and from 223,949 in the first quarter of 1954 to 252,171 in the first quarter of 1955. The per cent of estimated working time lost rose from 0.13 in 1953 to 0.15 in 1954, and from 0.09 in the first quarter of 1954 to 0.10 in the first quarter of 1955. (The 1954 yearly figures and the 1955 figures are preliminary and are based upon the data published in the *Labour Gazette*.)

In 1954, the greatest time losses occurred in the motor vehicles and parts industry (456,400 man-working days), the construction industry (202,700) and in mining other than coal (187,700). More than half of the man-working days lost in the first five months of 1955 was accounted for by the time lost in January, as a result of the dispute in the motor vehicles and parts industry.

Sugar. Centrifugal sugar continued in abundant supply in 1955 in the U.S. and throughout the world. It appeared that the U.S. crop would, more because of restrictions than otherwise, fall below that of 1954 which was valued at \$208,000,000 for 2,653,000 tons (raw value), of which 2,043,000 tons were from sugar beets, 610,000 tons from sugar cane.

The indicated U.S. sugar-beet crop of 12,474,000 tons was 13% less than the 14,091,000 tons of 1954, but substantially in excess of the average 10,431,000 tons for 1944-53. Acreage for harvest, under official restriction for the first time since

1935, was 744,000 ac., only 85% as much as the 876,000 ac. of 1954 but slightly above the 736,000-ac. average for the previous decade. The indicated yield was a record high of 16.8 tons per acre, as compared with 16.1 tons in 1954 and an average 14.1 tons.

Table I.—U.S. Sugar-Beet Production of the Principal Producing States

State	(in 000 tons)		Average 1944-53
	Indicated 1955	1954	
California	3,526	4,641	2,554
Colorado	1,628	1,654	1,897
Idaho	1,482	1,569	1,201
Michigan	840	771	633
Nebraska	740	786	699
Minnesota	732	819	447
Montana	686	683	709
Washington	675	761	375
Utah	464	535	467
Wyoming	392	475	411
North Dakota	391	418	223
Oregon	391	389	346
Ohio	264	247	183

Sugar cane for sugar and syrup was indicated at 7,056,000 tons, 6% less than in 1954 but 7% above average for the decade. The 291,000 ac. for harvest were 6% less than in 1954 and well below the 322,000-ac. average of the previous decade. The indicated yield of 24.2 tons per acre was the same as 1954 but well above the average 20.4 tons per acre for 1944-53. The USDA in October set the 1956 acreage allotment at 267,000 ac. as compared with 282,000 ac. in 1955.

Table II.—U.S. Sugar-Cane Production

State	(in 000 tons)		Average 1944-53
	Indicated 1955	1954	
Louisiana	5,865	6,200	5,402
Florida	1,191	1,281	1,161

U.S. consumption per capita of refined sugar in 1955 was indicated at 94.9 lb., slightly less than the usage in recent years. In addition, miscellaneous sweets used included about 50,000 ac. of sorgo for syrup, 1,657,000 gal. of maple syrup and 151,000 lb. of maple sugar. The 1955 honey crop was estimated at 243,100,000 lb., 12% more than in 1954, from 5,238,000 colonies of bees. California was the leading state (27,924,000 lb.) followed by Minnesota (21,627,000 lb.). U.S. sugar imports in 1954-55 included 3,555,000 tons of cane sugar valued at \$382,191,000, as compared with 3,944,000 tons valued at \$437,865,000 in the preceding year. An additional 2,140,758 tons were obtained in trade with U.S. territories, largely from Puerto Rico and Hawaii.

U.S. 1955 sugar consumption was estimated as high as 8,500,000 tons. The secretary of agriculture in July increased the sugar quota by 100,000 tons to 8,300,000 tons. It appeared that the initial quota for 1956 would probably be set at 8,300,000 tons.

World production of centrifugal cane and beet sugar for 1955-56 was forecast at a record 41,126,000 short tons, raw

Table III.—Centrifugal-Sugar Production of the Principal Producing Countries

Country	(in 000 of tons, raw value)		Average 1945-49	Average 1935-39
	1955-56	1954-55		
Cuba	5,000	4,994	5,898	3,111
U.S.S.R.	3,000	2,500	1,643	2,777
Brazil	2,470	2,479	1,420	811
United States	2,400	2,598	1,969	1,977
India	2,100	2,000	1,319	1,319
France	1,678	1,860	823	1,011

Peru	760	725	485	411
Dominican Republic	725	673	509	411
United Kingdom	710	699	612	511
Mauritius	564	551	351	311

value, as compared with 40,542,000 tons in the previous year and an average 28,536,000 tons in 1935-39. Cane accounted for 25,163,000 tons as compared with 24,945,000 tons in 1954-55, and beet sugar was 15,963,000 tons against 15,597,000 tons in the previous year. Noncentrifugal sugar, much less refined and known by a variety of local names, amounted to 6,724,000 tons as compared with 6,788,000 tons in the previous year and 5,502,000 tons prewar.

World production of sugar beets was indicated at 119,321,000 tons as compared with 113,596,000 tons in 1954 and a prewar average of only 82,071,000 tons. Acreage was expanded to 12,105,000 ac., as compared with 11,680,000 ac. in 1954 and 8,285,000 ac. prewar.

International trade in centrifugal sugar in 1954 was 13,730,289 tons as compared with 14,884,633 tons in the previous year, 46% larger than the average for early postwar years and 19% above prewar. Cuba exported 4,613,352 tons against 5,977,742 in the previous year. Western Europe imported 4,220,547 tons as compared with 5,793,865 tons in 1953.

The International Sugar council in April raised effective export quotas from 80% to 90% of basic tonnages, increasing the supply available to the free world market by 445,000 tons (to 4,133,000 tons). In June the council withdrew the rule that one-fifth of the initial export quota be held for shipment after August.

Both the U.S.S.R. and the Netherlands were unable to meet export quotas, so provided 372,000 tons for reallocation. But in July the quotas were cut back by 5% as prices dipped below the minimum. The council met in London in September under the chairmanship of Lawrence Myers, attended by delegates of 23 countries and some observers. Estimated free-market requirements for 1955 were revised upward to 4,690,000 metric tons, 40,000 tons more than the June estimate. It became clear that Brazil would not ratify, having sold something like three times what would have been its quota amount. Free-market prices, which had fallen significantly below the 3.25 cents per pound minimum, improved in one month in early 1955 from 3.17 cents per pound to 3.31 cents f.a.s. Cuba as the U.S.S.R. reached for imports. Some stocks were sold as low as 3.05 cents per pound.

(J. K. R.)

Suicide Statistics. There was a small increase in the suicide rate in the United States during 1955, as compared with the year before, according to provisional data relating to the first seven months of both years. The rate for the latter period was 10.3 per 100,000 population. There were altogether 15,980 suicides during the entire year of 1954, the rate being 9.9 per 100,000 population, about 3% lower than in 1953. In England and Wales 5,043 suicides were reported during 1954, with a rate of 11.4 per 100,000 population. On the other hand, Canada had a suicide rate of only 7.3 per 100,000 population in 1954, with 1,102 deaths.

Australia recorded a suicide rate of 10.9 per 100,000 population in 1953.

Suicide rates vary widely with age, with the highest rates among elderly persons. In the United States during 1954, the suicide rates per 100,000 population of stated ages were: 15-24 years, 3.6; 25-34 years, 8.7; 35-44 years, 12.1; 45-54 years, 18.7; 55-64 years, 23.2; 65-74 years, 26.3; 75-84 years, 25.3; and ages 85 and over, 21.0. Suicide is much more frequent among men than women, the rates according to race and sex being: white males, 16.8; white females, 4.6; nonwhite males, 6.7; and nonwhite females, 1.4 per 100,000 population.

The geographic differences in suicide are very marked, with the highest rates customarily in the Pacific coast area and the lowest rates in the south central states. In 1953 the suicide rates per 100,000 population were: New England, 8.9; middle Atlantic, 8.9; east north central, 10.8; west north central, 10.7; south Atlantic, 9.0; east south central, 7.2; west south central, 7.8; mountain, 13.3; Pacific, 15.7.

(M. Sp.)

Sulphur. Of the total world production of sulphur shown by countries in the section on MINERAL AND METAL PRODUCTION AND PRICES, the United States produced in 1954 more than 90%. Italy and Japan continued to supply most of the remaining 10%.

United States.—In 1954 domestic output of sulphur was triple that in 1939. The table below based on U.S. bureau of mines reports, gives the salient features of the industry from 1949 to 1954.

A substantial addition to the sulphur supply is derived from the sulphur content of pyrite ores of copper, lead and zinc which are roasted to produce by-product sulphuric acid.

In the first nine months of 1955, output of native sulphur was 4,576,970 short tons and recovered sulphur was 330,176 tons.

Producers' stocks included 3,360,388 tons of native and 119,536 tons of recovered sulphur.

The new Chacahoula mine of the Freeport Sulphur company, part of the four-year \$25,000,000 expansion program of development by the company, went into operation in February. This mine is in a 100,000-ac. reclaimed cypress swamp in Louisiana, about 50 mi. W. of New Orleans. The rated annual capacity is 100,000 tons.

(F. E. H.)

"HOT" SULPHUR in "Thermos bottle" containers being pushed on barges by a Mississippi river tug at New Orleans, La. Shipping sulphur and steel in a hot, molten state by this method was increasingly used in 1955

Sumatra: see INDONESIA.

Summerfield, Arthur E(IIsworth) (1899—), U.S. government official, was born at Pinconning, Mich., on March 17. He worked in various automobile plants and in real estate, and in 1924 became distributor in Flint, Mich., for the Pure Oil company.

In 1929 he founded the Summerfield Chevrolet company and in 1938 became president of the Bryant Properties corporation. He became active in Republican politics during Wendell Willkie's campaign for the presidency in 1940. In 1943 he was appointed finance director of the Republican state central committee, and in 1944 he was elected committeeman from Michigan at the Republican national convention. Summerfield was appointed to the chairmanship of the Republican strategy committee in July 1949, and in July 1952 he was elected chairman of the Republican national committee.

On Nov. 25 Pres.-elect Dwight D. Eisenhower selected Summerfield to serve as U.S. postmaster general. He was confirmed by the U.S. senate on Jan. 21, 1953, and was sworn into office the same day.

During 1954 and 1955 Summerfield made strenuous, though unavailing, efforts to secure from congress authorization to increase postal rates on certain classes of mail matter in order to decrease the annual deficit of the department. In May 1955 he advised Pres. Eisenhower to veto an 8.8% average increase in pay for postal workers, and congress adopted a compromise figure of 8% the next month.

Support Prices: see AGRICULTURE.

Supreme Court of the United States. The annual term of the court began Oct. 4, 1954, and ended June 6, 1955. Associate Justice Robert Houghwout Jackson died Oct. 9, 1954, after 13 years of service on the court. Former Associate Justice Owen J. Roberts, who resigned from the court in 1945, died May 17, 1955. John Marshall Harlan of New York, a judge of the United States Circuit Court of Appeals for the Second Circuit, was named to succeed Justice Jackson and took his seat on the bench on March 28, 1955.

The court disposed of 1,566 cases, the largest volume of business since the 1948 term. In 1953-54, the court disposed of 1,303 cases. Of the cases disposed of all but 105 were decided without oral argument being permitted. Seventy-eight full opinions were handed down as compared with 65 during the previous term, and dissenting opinions numbered 45 as compared with 54 in 1953-54. The justices also wrote 14 concurring opinions.

The United States or a state was a party in all but 20 of the cases in which written opinions were rendered.

Prior to adjournment the court announced that hereafter it would not sit on Fridays to hear oral arguments. Heretofore, when in session, the court sat Monday through Friday.

Members of the Court.—The United States Supreme Court in 1955 was composed of the following members (dates indicate year appointment was confirmed by the senate): chief justice, Earl Warren (1954); associate justices, Hugo L. Black (1937), Stanley Reed (1938), Felix Frankfurter (1939), William O. Douglas (1939), Harold H. Burton (1945), Tom C. Clark (1949), Sherman Minton (1949) and John M. Harlan (1955). (See also LAW.) (H. B. Wv.)

Surgery. Surgery of heart conditions occupied a prominent place in new advances during 1955. C. W. Lillehei and his co-workers reported successful use of cross circulation

in the repair of intracardiac defects. The heart and lungs of a donor, usually a relative, are used to circulate the blood and oxygenate it during which time the blood is circumvented from entering the patient's heart, making it possible to open the heart of the patient in a bloodless field. None of the blood enters the heart except that which is necessary to nourish the heart muscle through the coronary arteries. Lillehei *et al.* reported the repair of defects in the partition between the two heart ventricles in 25 cases with only seven deaths, and of 9 cases of tetralogy of Fallot (blue baby) with only four deaths. This procedure was used only in the severer cases.

D. A. Cooley and his co-workers emphasized the importance of conservative treatment in penetrating wounds of the heart. In 57 cases observed, 15 cases without treatment had a 46% mortality, 14 cases were operated upon with a mortality of 50%, and 28 were treated by simple removal of the blood from the pericardium (the sac surrounding the heart) with only 10.7% mortality.

H. W. Baker and his co-workers attempted to determine the risk of surgery in patients with previous coronary thrombosis and infarction of the heart muscle. Seventy patients with previous coronary thrombosis were subjected to 111 operative procedures. Operative mortality rate was 3.6%, and the incidence of cardiorespiratory complications was 7.2%. Baker *et al.* found that the death rate and heart and lung complications were higher in patients with congestive heart failure and irregularities of the heart beat. An increase in mortality and complications was not apparent in patients with angina pectoris, enlarged heart or high blood pressure. They observed five deaths in 13 patients who had had congestive heart failure prior to the operation (38%) as compared with a 7% mortality rate in those who had no previous heart failure. Deaths or heart and lung complications occurred in 23% of patients with irregularities in heart rate as compared with a mortality of 9.4% in those patients with normal rhythm. The incidence of deaths and complications in the hypertensive group was 13%, and in the non-hypertensive group it was 12.8%. Baker and his co-workers also showed that the length of time that the operation took increased the risk and found that the risk from operation was least when it was done under local anaesthesia, somewhat

EYE SURGEONS transplanting eye tissue from a wild bat ray to a "pet" ray in a public aquarium at Los Angeles, Calif., in 1955. It was believed that this was the first underwater operation ever performed

greater when done under spinal and greatest when done under general anaesthesia.

A. de S. Pereira discussed the treatment of internal carotid thrombosis (a clotting of the main artery that goes to the brain), which is likely to be confused with a stroke. He reported 31 cases which had been treated surgically among 154 patients with evidence of stroke. Attempts to revascularize the brain were unsuccessful by many methods. The best results were obtained when the blood supply to the brain was increased by removing the sympathetic nerves in the neck, which control the blood vessels going into the brain. The other methods offered little or no relief.

L. W. Guiss studied the incidence of cancer in the second breast of women who had had cancer in one breast. He found that about 3% of all women who have had removal of one breast for cancer will ultimately develop an independent cancer in the opposite breast. This is about three times the chance that a woman who has not had cancer has of developing breast cancer. It seems paradoxical, but Guiss found that patients with bilateral independent cancers have a better prognosis than those with cancer in only one breast. In his series of cases, 35.1% with bilateral disease were free from disease after 15 years as compared with 25.1% with unilateral disease. He saw no justification in routine removal of the opposite breast in a woman who has had cancer of one breast.

In some patients, following removal of the stomach for ulcer or cancer, symptoms occur after eating which have been designated as a "dumping syndrome." J. M. Walker and his co-workers demonstrated that this results from a loss in the volume of the fluid portion of the blood. Usually sugar in high concentration causes this, and Walker and his associates showed that there is a secretion into the lumen of the intestine from the blood stream which causes the faintness and nausea of which the patient complains. M. A. Hayes, in studying the dietary control of the postgastrectomy "dumping syndrome," stated that it is caused by the ingestion of carbohydrates and proteins, which are easily absorbed, and this increases the activity of the intestine. Symptoms which the patients complain of are increased pulse rate, palpitation, sweating, dizziness and nausea. In order to prevent these symptoms, he suggested the use of a high-fat diet and a low carbohydrate and protein intake. The fat, which is slowly hydrolyzed, prevents the marked outpouring of fluid into the lumen of the intestine and the undesirable manifestations. The administration of a high-fat diet also favours a gain in weight, which many of these patients do slowly.

J. H. Mahaffey and J. M. Howard found that in 100 patients on a general surgical service 9% developed laboratory evidence of pancreatitis. The highest incidence was in a group in which resection of a large portion of the stomach had been done. The next largest was in a group of patients undergoing sympathectomy. Gynaecologic operations were not associated with any evidence of pancreatitis. Operations on the gall-bladder and bile tracts were associated with a low incidence of pancreatitis. In none of the 31 patients who had operations done outside the abdomen was there any evidence of pancreatitis. Mahaffey and Howard stated that postoperative pancreatitis is much commoner than is ordinarily thought, but is much less severe than spontaneously occurring pancreatitis. (See also ELECTRONICS.)

Surinam (DUTCH GUIANA), an overseas territory of the Netherlands in northeastern South America, has an area of 55,143 sq.mi. and lies between British Guiana to the west and French Guiana to the east. Its population (est. 1954) of 220,000, engaged mainly in agriculture, lives along the narrow coastal plain, and only 30,000 dwell on the extensive plateau to the south, where they are engaged chiefly in mining and timber enterprises. The capital is Paramaribo (pop., 1952 est., 86,400). Half the population is of Asian origin, India and Indonesia being the areas of chief importance. Persons of European, African or indigenous stock, predominantly in mixed strains, constitute a minority. The official language is Dutch. The governor in 1955 was J. Klaasesz. The premier was J. Ferrier.

History.—The most important event in 1955 was the visit of the queen of the Netherlands, which occurred in October. It was the first time the sovereign had ever visited Surinam.

In March the first election under the new constitution took place, and the group formerly in power, known as the Coalition, dropped from 13 to 8 members of the national legislature (*staten van Suriname*) of 21 members. Various small parties, associated as the Unity group, took power with 13 members, including representation of the Progressive, Agrarian and Democratic parties and several independents.

During the year progress was made in implementing the program of public works originally put forward by the International Bank for Reconstruction and Development. A ten-year plan was evolved, which was to go beyond the program of the bank. A total outlay of approximately \$63,000,000 over the ten years on essential public works was contemplated. One-third of the cost would be borne by Surinam and one-third by the Netherlands, while the latter would lend the third portion to Surinam, repayable over a long period of time.

(See also NETHERLANDS ANTILLES.) (C. E. Mc.)

Education.—On Jan. 1, 1955, there were 141 elementary schools with 39,293 pupils and 1,016 teachers, 12 advanced and higher elementary schools with 4,165 pupils and 169 teachers and 2 secondary schools with 474 students and 34 teachers.

Finance.—The monetary unit is the Surinam gulden or florin, valued at 53.0264 cents U.S. currency, official rate, in 1955. The 1955 budget estimated revenue at 43,000,000 florins and expenditure at 43,733,000 florins; revenue in 1954 was 39,070,000 florins and expenditure 41,300,000 florins. Currency in circulation on Dec. 31, 1954, totalled 13,212,000 florins.

Trade and Communications.—Exports in 1954 totalled 55,183,000 florins; imports, 51,959,000 florins. Leading exports were bauxite (83%), timber (8%), rice (3%) and coffee (2%). Leading customers were the U.S. (81%), the Netherlands (6%) and Canada (3%); leading suppliers, the U.S. (38%), the Netherlands (29%), Trinidad (8%) and the U.K. (7%). Internal transportation is largely by water; in 1954 there were 83 mi. of railway, 525 mi. of roads, 3,186 telephones and 2,458 motor vehicles. Vessels entered in 1954 totalled 877 of 2,229,580 net registered tons; vessels cleared, 877 of 2,223,720 tons. In 1954, 696 aircraft landed at Zandery airfield.

Production.—Figures for 1954 included bauxite 3,362,000 metric tons; gold 211 kg.; balata 116 tons; sugar 8,563 tons; rice (paddy) 66,659 tons; rum 505,000 l.; molasses 2,224,000 l. (J. W. Mw.)

Sweden. A democratic monarchy of northern Europe, Sweden has an area of 173,564 sq.mi. Pop. (1955 est.) 7,241,000. Capital: Stockholm, pop. (1953 est.) 769,714; greater Stockholm had about 1,030,000. Other principal cities (pop., Jan. 1, 1954): Göteborg 367,569; Malmö 201,939; Norrköping 87,989; Helsingborg 72,660; Örebro 69,637; Uppsala 67,087. Religion: Lutheran Christian. Ruler in 1955: King Gus-

WILD MOOSE CHASING A SOLDIER down a street in the heart of Stockholm, Swed., in 1955. The animal, entering the city from nearby woods, finally leaped into a lake after frustrating capture by police, firemen, soldiers and citizens

tav VI Adolf. Prime minister: Tage Erlander.

History.—Prosperity continued to shine on Sweden, but it was accompanied with complexities. Swedish wages, already the highest in Europe, were increased by about 3% in the agreements of Jan. 1955, and later certain categories of seamen won up to 11%. Many imports from dollar lands were placed on the free list in the fall of 1954, and more on Jan. 1, 1955. Imports soared, and reserves of foreign currency declined—\$100,000,000 in 1954, and at an increasing rate in 1955. The wholesale price index rose by mid-1955 to 307 (1935=100).

In 1954 the government tried to retain the interest rate of 2½%, but in October offered a loan at 4% to try to entice some of the surplus funds. In April 1955, the discount rate was raised to 3½%, and the government offered a new loan at 4½%. A forced savings plan was vigorously debated and finally abandoned. But depositors could earn 4% on up to 1,000 kronor, and if they left their money in banks until 1961 they were promised a 20% premium on 1955 deposits and a 15% premium on 1956 deposits. Corporate taxation was to be increased from 40% to 45% in 1956 and 50% in 1957. A temporary tax of 12% was placed on certain investments for plant expansion; this, according to the opposition, would only further limit production and export, in which Sweden was already lagging.

The social welfare system was expanded in January with the introduction of compulsory sickness insurance. Costs were about \$5 per year for medical care plus \$6 for sickness benefits for the lower income groups; for an average family the total costs would be about \$30 per year. The individual could choose his own doctor and would get up to two years of medical and hospital care with almost no additional cost; earnings lost by illness would be compensated up to 65%–70% for the first 90 days, and at a lower rate thereafter. The sum of \$160,000,000 was expected to cover the total costs; of this 44% was to be paid by individual premiums, 27% by employers and 29% by general taxation.

Problems of defense plagued Sweden in various ways. Unidentifiable U-boats were observed off the east coast; fishing vessels were captured by the Russians and fined for violating their 12-mi. limit in the eastern Baltic. A major espionage ring was broken up with arrest or expulsion of five Swedes and six foreigners, several of the latter connected with the Czech and Rumanian legations. Within-the-rock defense shelters in Stockholm neared completion, and could accommodate 52,500 per-

sons, or 13,000 for sleeping.

In the field of Scandinavian co-operation a convention was signed in Copenhagen, Den., Sept. 15, 1955, permitting citizens of Denmark, Finland, Iceland, Norway and Sweden to get the full social security benefits of whichever one of the five countries they resided in.

The major governmental shift was the retirement of Per Edvin Skold as minister of finance, and his replacement by Gunnar Strang. (F. D. S.)

Education.—Schools (1953): primary 8,959, pupils 727,970, teacher 37,369; higher primary and intermediate 144, pupils 40,511; secondary 254, pupils 118,843; vocational 484, pupils 104,243; students at adult vocational schools 29,406. Teachers' training colleges 29, students 5,636. Universities 4, students (1952) 12,677, professors and lecturers 1,686; institutions of higher education (1953) 12, students 6,073.

Finance and Banking.—Monetary unit: krona (pl. kronor), with an exchange rate of 5.17 kronor to the U.S. dollar. Budget (1955 est.): revenue 9,023,000,000 kronor; expenditure 10,141,000,000 kronor. Public debt (1954) 13,587,000,000 kronor. Currency circulation: (Dec. 1954) 5,160,000,000 kronor; (June 1954) 4,640,000,000 kronor. Bank deposits: 5,930,000,000 kronor; (June 1954) 5,840,000,000 kronor. Gold and foreign exchange (March 1955): U.S. \$444,000,000.

Foreign Trade.—(1954) Imports 9,198,000,000 kronor; exports 8,217,000,000 kronor. Main sources of imports: Germany 20%; U.K. 16%; other continental European Payments Union countries 31%; U.S. and Canada 8%; Latin America 8%. Main destinations of exports: U.K. 19%; Germany 12%; other continental E.P.U. 38%; Latin America 8%; U.S. and Canada 5%. Main exports: wood pulp 18%; wood 14%; iron ore 9%; paper 10%.

Transport and Communications.—Roads (1953): 173,000 km. Motor vehicles in use (1954): cars 421,277, commercial vehicles 100,555. State railways (1954) 15,176 km.; passenger-km. (1953) 6,234,000,000; freight, ton-km. (1954) 8,553,000,000. Shipping: merchant vessels of 100 gross tons and over (July 1954): 1,256; total tonnage 2,703,467. Air transport (1954): 378,813,000 passenger-km.; freight, 11,215,000 ton-km.; km. flown (1953) 13,892,000. Telephones (Jan. 1954): 1,994,378. Radio receiving sets (Dec. 1953): 2,317,000.

Agriculture.—Main crops (metric tons, 1954): wheat 1,031,000; barley 364,000; oats 858,000; rye 308,000; potatoes 1,465,000. Livestock (Sept. 1954): cattle 2,582,000; sheep 234,000; horses 337,000; chickens 11,751,000; pigs (1953) 1,440,000. Fisheries (1953): 210,000 metric tons.

Industry.—Index of industrial production (1955: 1948=100): 122. Index of employment (Jan. 1955; 1948=100): 98. Electricity (1954): 23,720,000,000 kw.hr. Raw materials (metric tons, 1954): iron ore (metal content 60%) 15,418,000; pig iron 940,000; crude steel 1,861,000; (1953) copper ore 14,500; lead ore 25,000; zinc ore 43,000; gold 2,192 kg. Manufactured goods (metric tons 1953): wood pulp 3,223,000; cement 2,321,000; lumber (cu.m.) softwood 6,775,000; hardwood 125,000. Merchant shipping launched (1953): 484,622 tons.

Sweet Potatoes: see POTATOES.

Swimming. Athletes from the United States dominated swimming competition in the Pan-American games which were held at the University of Mexico, Mexico City, in March 1955, winning six of eight first places in the

men's division and three of six first places in the women's division. The Pan-American games diving gold medals were shared equally by Mexico (two) and the United States (two).

Clarke Scholes of the United States established a Pan-American games record in the 100-m. free style, while Frank McKinney, Jr., also of the U.S., tied the existing record in the 100-m. backstroke. Other record performances were those by the United States 400-m. medley relay team and by Canada's Leonardo Fisher, in the women's 100-m. backstroke.

National A.A.U. Indoor.—World, U.S. and championship records highlighted the National Amateur Athletic union swimming and diving indoor championships at Yale university on March 31–April 2, 1955. World and U.S. records were posted in the 220-yd. free style, 220-yd. breast stroke, 220-yd. butterfly, 400-yd. individual medley and 400-yd. medley relay. In addition, new championship marks were established in all events with the exception of the 1,500-m. free style and 100-yd. backstroke.

Ford Konno, Yoshi Oyakawa and Gerry Harrison, competing unattached from Columbus, O., each accounted for two winning performances. High-point honours went to Jack Wardrop, of Ann Arbor, Mich., via Motherwell, Scot., who swam to a world record in the 400-yd. individual medley and took second places in the 220-yd. and 440-yd. free-style events.

Team honours went to the New Haven Swim club.

Ford Konno won both the 220-yd. and 440-yd. free-style events, the former in world and U.S. record times.

National A.A.U. Women's Indoor.—Scoring a total of 95 points, the Walter Reed Swim club, of Washington, D.C., swept the 1955 National A.A.U. women's swimming and diving championships, held at Welch pool, Daytona Beach, Fla., on April 7–9.

Shelley Mann of the Walter Reed Swim club gained high-point honours with 25 points, winning the 100-yd. and 250-yd. free-style events and taking third place in the 100-yd. back-

stroke, as well as capturing the gold medal in the 400-yd. individual medley. Miss Mann also took turns in the winning of both relays by the Walter Reed Swim club.

National A.A.U. Men's Outdoor.—The 1952 Olympic games backstroke champion, Yoshi Oyakawa of the Hawaii Swimming club, sparkled brightest in the National A.A.U. swimming and diving championships which were held in Los Angeles on July 20–22, 1955, coming through with two record-breaking performances.

On July 21 Oyakawa bettered the championship meet record in the 100-m. backstroke. He followed this by bettering the championship meet record and the U.S. mark in the 200-m. backstroke.

The New Haven Swim club won the team title.

The National A.A.U. championships produced a number of new meet records, in addition to those posted by Oyakawa. Bob Mattson of North Carolina State college set one in the 200-m. breast stroke, Bill Woolsey of Hawaii in the 200-m. free style,

Bill Yorzyk of the New Haven Swim club in the 200-m. butterfly and George Harrison of the Berkeley (Calif.) City club in the 400-m. individual medley. The New Haven Swim club also bettered the 400-m. medley relay mark.

National A.A.U. Women's Outdoor.—In the National A.A.U. women's outdoor swimming and diving championships, which were held at Philadelphia, Pa., Aug. 11–14, Wanda Werner, a 14-year-old girl representing the Walter Reed Swim club, paddled to the 100-m. free-style title; a 15-year-old, Carin Cone, of Ridgewood, N.J., gathered in two gold medals, in the 100-m. backstroke and the 200-m. backstroke; while 17-year-old Marie Gillett, of the Walter Reed Swim club, posted a new U.S. record in the 400-m. individual medley, bettering her previous mark made a year before.

The Walter Reed Swim club of Washington, D.C., won the national championships team crown.

Betty Mullen of the Walter Reed club came through with a world record-breaking performance in the 100-m. butterfly. In this event the competition was so spirited that the second- and third-place winners, Mary Jane Sears and Shelley Mann, also bettered the existing record.

In winning the 200-m. backstroke, Carin Cone tied the world record for a 50-m. course.

One of the big upsets of the championships came when Juno Stover Irwin of Pasadena, a veteran of the 1948 and 1952 Olympic games, won the platform diving title, besting the

favourite and many times champion, Patricia McCormick of the Los Angeles Athletic club. (W. R. SR.)

Switzerland. A republican confederation of 22 cantons (three of which have half-cantons) in west central Europe, Switzerland is bounded west by France, north by Germany, east by Austria and Liechtenstein and south by Italy. Area: 15,941 sq.mi. Pop.: (1950 census) 4,714,992; (1955 est.) 4,978,000. Language (1941): German 72.6%; French 20.7%; Italian 5.2%; Romansh 1.1%. Religion (1941): Protestant 57.6%; Roman Catholic 41.4%; Jewish 0.5%; other 0.8%. Chief towns (pop., 1952 est.): Berne (cap.) 150,600; Zürich 400,300; Basle 187,800; Geneva 151,400; Lausanne 109,000. President of the confederation for 1955, Markus Feldman.

History.—In spite of the U.S. duty on watches which still hampered the Swiss watch industry, Swiss foreign trade, the index of Swiss prosperity, continued its unprecedented expansion. Imports from the German Federal Republic constantly increased and there was a steady development in other directions, even including the export of watches. While the shortage of labour began to make itself seriously felt, the revenue from postal services, railways, customs and direct taxes broke all former records. In order to curb inflationary pressure the government announced in April that the surplus revenue would be used to pay off the national debt but not to reduce taxation. When, however, the budget for 1956 was brought forward immediately before the general election on Oct. 30, it was stated that the national income for 1955 would approach 24,000,000,000 Fr., or 10,000,000,000 Fr. more than in 1945. At this point, therefore, the government proposed to reduce taxation in 1956 by 104,000,000 Fr.; at about the same time it was announced that cost of living bonuses to civil servants would be increased from 5½% to 7%.

Politically the year was dominated by the general election; thus, during the first ten months of 1955 the political parties were cautiously manoeuvring for position. The most discussed political theme before the opening of the election campaign was the "Chevallier initiative." This was the demand for a popular vote on the suggestion that Swiss military expenditure should be halved during either 1955 or 1956 and the consequent saving spent upon social welfare at home and abroad. The proposal came from the Vaud canton (Samuel Chevallier was a journalist in Lausanne) and had actually been handed in to the authorities with the constitutionally necessary backing (in this case 80,515 signatures) on Dec. 2, 1954.

It expressed a fairly widespread dislike of the magnitude of the military budget and also the obstructive feelings of the French Swiss toward the German-Swiss minister of defense, Karl Kobelt, who had resigned in 1954. The initiative was badly formulated, and after much discussion the Swiss government on Aug. 8 published a report in which it laid down that although the initiative had been correctly proposed (this was in doubt for some time) it could not be implemented since military expenditure in 1955 and 1956 was already contracted for; therefore, it was stated, a popular vote on the matter would not take place.

The new French-speaking minister of defense, Paul Chaudet, was thought to be better liked by the French Swiss than his predecessor, especially in his own Vaud canton. He showed great energy in the matter of mechanizing the Swiss army with the aid of Centurion tanks bought from Great Britain. He was however accused by the Socialist and Peasant party of endangering the traditional militia system of the Swiss. A general feeling that, with Moscow smiling, it was superfluous to take military matters so seriously, and a more particular feeling that the Chevallier initiative had been unfairly quashed, fed a certain mounting opposition to the policy of the federal council.

This became evident when the general election was held on

Oct. 30. A strict system of proportional representation means that the results of elections vary only slightly from one four-year period to another in Switzerland. In the circumstances the fact that the Social Democrats gained four seats, and, by doing so, became the strongest party, with 53 seats in the chamber, was impressive. The Radical party, with only 50 seats, was thus deposed to the second place; it was of interest that it lost a seat in the Vaud canton precisely where it had been expected that Chaudet's activities would have strengthened the party.

The small Party of Labour (Communist) gained a seat in Vaud, losing one, however, in its traditional headquarters of Geneva and also in Zürich; three of its four deputies were now French Swiss. The Catholic Conservative party was also weakened by one seat in the chamber, although, because of the influx of mainly Italian-speaking Catholics, it gained a seat in both Zürich and Geneva.

On the same day as the general election 14 cantons re-elected their representatives in the council of states. In six cases the nominations were accepted without a contest, but elections did in fact take place in Zürich, Lucerne, Basel *Land*, Schaffhausen, Aargau, Vaud, Valais and Geneva. Among these contests that at Zürich aroused the greatest interest because Gottlieb Duttweiler, the bad boy of Swiss politics with no policy but one of action, who had represented Zürich in the council of states from 1947 to 1951, put up for re-election and was only just beaten by a Radical and a Socialist. Duttweiler's Independent party (Landesring der Unabhängigen) also polled better in the election to the chamber than had been anticipated, fully maintaining its strength. The Radicals and Catholic Conservatives thus found themselves in office (three ministers each in the federal council) with both Socialists and Independents, respectively the largest and most enterprising parties, in opposition

(E. Wi.)

Education.—Schools (1951-52): primary, pupils 476,331, teachers 14,476; secondary and lower middle, pupils 80,207, teachers 3,310; vocational (1951, excluding agricultural schools) 89, pupils 21,112. Universities (1953-54) 7, students 12,444, professors and lecturers 1,460. Other institutions of higher education (1953-54) 2, students 3,161, teachers 473.

Finance and Banking.—Monetary unit: Swiss franc, with an exchange rate of 4.28 Fr. to the U.S. dollar. Budget (1954 est.): revenue 1,958,400,000 Fr., expenditure 1,922,000,000 Fr. Internal debt (Dec. 1953): 7,758,000,000 Fr. Currency circulation: (Dec. 1954) 5,830,000,000 Fr., (April 1955) 5,502,000,000 Fr. Bank deposits: (Dec. 1954) 7,369,000,000 Fr., (Feb. 1955) 7,438,000,000 Fr. Gold and foreign exchange holdings: (National bank, July 1955) U.S. \$1,602,000,000; (June 1954) U.S. \$1,542,000,000.

Foreign Trade.—(1954) Imports 5,587,000,000 Fr., exports 5,264,000,000 Fr. Main sources of imports: Germany 22%; France 13%; other continental European Payments union countries 24%; U.S. and Canada 16%; Latin America 7%; U.K. 6%. Main destinations of exports: U.S. and Canada 14%; Germany 12%; France 7%; other continental E.P.U. 28%; Latin America 8%; U.K. 5%.

Transport and Communications.—Roads (1953): 49,000 km. Motor vehicles in use (1953): cars 211,000; commercial vehicles 47,700. Railways (1954) 5,049 km. of which 2,976 km. federal system; passenger-km. (1953) 6,072,000,000; freight, ton-km. (1954, federal system only) 2,718,000,000. Shipping (July 1954): merchant vessels of 100 gross tons and over 34; total tonnage 124,000. Air transport (1954): passenger-km. 447,497,000; freight, ton-km. 9,035,700; km. flown (1953) 13,008,000. Telephones (Jan. 1954): 1,074,216. Radio receiving sets (1953): 1,161,000.

Agriculture.—Main crops (metric tons, 1954 revised figures): wheat 295,000; rye 45,000; barley 56,000; oats 68,000; beet sugar (raw) 28,000; potatoes 1,250,000. Wine production (metric tons, 1953) 63,000. Livestock (Sept. 1954): cattle 1,593,000; sheep 195,000; pigs 950,000; horses 126,000; chickens 6,260,000; ducks, geese and turkeys 70,000; goats (1951) 147,000. Meat production (metric tons, 1954): 78,000 (in 43 towns only, and including horse meat). Dairy production (metric tons, 1954): butter 30,000; cheese 50,400; milk 2,768,000.

Industry.—Index of employment (1948=100): manufacturing (Sept. 1954) 105; (March 1955) 107. Unemployed: (March 1954) 1.5% (March 1955) 1.4%. Fuel and power: manufactured gas (1953) 317,000,000 cu.m.; electricity (1954) 11,240,000,000 kw.hr. Cement (1953) 1,581,000 metric tons. Dwelling units completed (1954): 13,134. Watches and watch parts (exports, value, 1954): 1,039,915,622 Fr.

Syria. Syria, an Arab republic, is bounded west by the Mediterranean and Lebanon, northwest and north by Turkey, east and southeast by Iraq, south by Jordan and southwest by Israel. Area: 70,014 sq.mi. Pop. (1954 est.): 3,970,000. Language: Arabic (86%); also Kurdish, Armenian, Turkish, Circassian. Religion (1951 est.): Moslem (mainly Sunni) 85.7%; Christian 14%. Chief towns (pop., 1952 est.): Damascus (cap.) 372,708; Aleppo 380,919; Homs 261,904; Hama 155,671; Latakia 105,363. Presidents in 1955: Hashem el-Atassi and (from Sept. 6) Shukri el-Kowatli. Prime ministers: Faris el-Khuri (till Feb.); Sabri el-Assali (Feb. 13–Sept. 6); and (from Sept. 13) Said el-Ghazzi.

History.—Early in Feb. 1955 Faris el-Khuri, who had been prime minister since Oct. 1954, resigned. He was succeeded by Sabri el-Assali who, faced with the clash between Egypt and Iraq over the Turco-Iraqi treaty, at once declared that Syria would contract no alliances with states other than Arab and accepted an Egyptian invitation to participate in a new Arab defense treaty to replace the Arab league collective security pact which, as the Egyptian government had declared after Iraq's signature of the alliance with Turkey, no longer existed. The new treaty bound participants to assist other members in resisting aggression; not to conclude other outside military or political agreements—whether international or within the middle east orbit—without the consent of other members; and to establish unity of command covering all military organization—training, equipment, etc. Following the conclusion of the treaty the Turkish government protested against “aggressive declarations” by Syrian statesmen. Later the Turkish government refused to accept the Syrian government's explanation of the relations between the Arab countries resulting from the conclusion of the Turco-Iraqi treaty and described the Syrian version of Turco-Syrian relations and of the aims of the new Arab defense treaty as unacceptable and untruthful. This was followed by tension along the Turco-Syrian frontier which the Turks claimed had been violated by Syrian aircraft. The Syrians replied with charges that the Turks were mobilizing hostile forces on the border. But tension was eased after talks between the Syrian and Iraqi governments when it was agreed that both parties desired understanding and agreement between all Arab states.

In April differences among the political parties led to disturbances in Hama and Damascus. In August further party differences following the hotly contested election of Shukri el-Kowatli as president led to resignations from the cabinet and the formation of a coalition opposition composed of opponents to the new president; and in September the prime minister (Sabri el-Assali) resigned. He was succeeded by Said el-Ghazzi.

During the year Syria's relations with Israel progressively deteriorated. In the spring and early summer there were sporadic clashes in the Sea of Galilee and Lake Huleh areas; and when Egyptian-Israeli relations along the Gaza border became tense in June, Syria expressed its sympathy with Egypt. On taking office as president in September, Shukri el-Kowatli declared that “every Arab government and individual should help Egypt to repel Jewish attacks.” Thereupon trouble flared up in the Sea of Galilee area in the form of local attacks and counterattacks which led to the mobilization of the forces of both countries along the border.

In April the International Bank for Reconstruction and Development indicated that it would be prepared to grant a substantial loan toward the implementation of the five-year development plan that it had sponsored. (O. M. T.)

Education.—Schools (1954): primary 2,594; pupils (1952) 311,033, teachers (1952) 8,811; secondary 212, pupils (1952) 47,670, teachers (1952) 3,150; vocational 12, pupils (1952) 1,676, teachers (1952) 164. Teachers' training colleges (1952) 8, students 1,255. University of Damascus (1952): students 2,404, teaching staff 107.

Finance and Trade.—Monetary unit: Syrian pound, with a free exchange rate of L.S. 3.58 to U.S. \$1. Budget (1955 est.): balanced at L.S. 261,000,000. Currency circulation: (Dec. 1953) L.S. 297,000,000; (Dec. 1954) L.S. 360,000,000. Imports (1954) L.S. 634,000,000, exports L.S. 466,000,000.

Transport and Communications.—Roads (1953): 10,016 km., including 2,424 km. asphalted. Motor vehicles in use (1952): cars 6,100; commercial vehicles 5,700. Railways (1954): state 248 km.; Syria-Lebanon routes 583 km. Telephones (Jan. 1954): 27,155. Radio receivers (1950): 45,000.

Agriculture.—Main crops (metric tons, 1954): wheat 1,204,000; barley 561,000; rice 25,000; cotton, lint 70,000; cottonseed 135,000; lentils 58,000; oats (1953) 5,000; sesame (1953) 9,700; oranges, tangerines, etc. (1953) 3,000; apricots about 23,000; grapes (1953) 243,000; raisins (1952) 184,000; figs (1952) 48,200. Livestock (Sept. 1954): cattle 509,000; sheep 3,746,000; horses 98,000; mules 78,000; asses 260,000; chickens 2,836,000; goats (1951) 1,433,000. Wool production (metric tons, 1954) 5,000.

Industry.—Electricity 128,930,000 kw.hr. Production (metric tons): cement (1954) 248,800; cotton yarn (1950) 4,700; capacity (cotton and rayon) of 92,000 spindles in use (1954) about 12,250.

Table Tennis. The 22nd world championships in table tennis were held in Utrecht, Neth., April 15 to 24, 1955. Japan again won the Swaythling cup but lost the Corbillon cup to Rumania. The men's singles winner was Toshiaki Tanaka, Japan. Angelica Rozeanu, Rumania, won the women's singles for the sixth successive time. Men's doubles were won by Ivan Andreadis and Ladislav Stipek, Czechoslovakia; women's doubles by Angelica Rozeanu and Ella Zeller, Rumania; mixed doubles by K. Szepesi and Eva Koczian, Hungary. The 1956 world tournament was to be held in Japan.

The 25th U.S. national open championships were held at Rochester, N.Y., March 18 to 20, 1955. The winners were: men's singles, Richard Miles, New York city; women's singles, Mrs. Leah Neuberger, New York city; junior boys' singles, Erwin Klein, Los Angeles, Calif.; junior miss singles, Sharlene Krizman, South Bend, Ind.; boys' singles, Norbert Van De Walle, Chicago, Ill.; senior men's singles, Tibor Hazi, Chevy Chase, Md.; esquire singles, Bill Gunn, Mamaroneck, N.Y.; men's doubles, Erwin Klein and Richard Bergmann, London; women's doubles, Mrs. Leah Neuberger and Peggy Folke, New York city; mixed doubles, Richard Miles and Mildred Shahian, Chicago; senior doubles, Tibor Hazi and Mamfred Feher, Cleveland, O.

The English open championships were held at Empire Pool, Wembley, Eng., March 29 to April 2. The men's singles title was won by Zarko Dolinar, Yugoslavia; women's singles, Rosalind Rowe, England; men's doubles, Ivan Andreadis and Ladislav Stipek, Czechoslovakia; women's doubles, Rosalind Rowe and Diane Rowe, England; mixed doubles, Aubrey Simons and Helen Elliot, England; boys' doubles, Erwin Klein, Los Angeles, and B. Onnes, Netherlands; girls' doubles, Joice Fielder and Ann Haydon, England; junior mixed doubles, Erwin Klein and Wendy Bates, Wales.

The Canadian International table tennis championships were held at the Canadian National exhibition, Toronto, Ont., Sept. 9–11, 1954. Winners were: men's singles, Erwin Klein, Los Angeles; women's singles, Mrs. Leah Neuberger, New York city; senior men's singles, Max Marinko, Toronto; junior men's singles, Erwin Klein; junior miss singles, Carolee Liechty, South Bend, Ind.; boys' singles, Sandy Potiker, Cleveland, O.; men's doubles, Erwin Klein and Bernard Bukiet, Chicago; women's doubles, Mrs. Leah Neuberger and Pauline Robinson, New York city. In the International team matches the United States won the men's, junior men's and junior miss events.

The closed championships of the U.S.S.R. were held at Minsk March 3–6, 1955. Winners (full names not available) were as follows: men's singles, Frants; women's singles, Lestal; men's doubles, Frants and Kanepi; women's doubles, Balashene and Gelevechute; mixed doubles, Frants and Saar. (P. W. R.)

Tangerines: *see* FRUIT.

Tangier. From 1912 an international and demilitarized zone of Morocco, on the south side of the Straits of Gibraltar, Tangier is controlled by Belgium, France, Great Britain, Italy, the Netherlands, Portugal, Spain, Sweden and the United States, under the nominal sovereignty of the sultan of Morocco. Area: 135 sq.mi. Pop.: (1952 est.) 162,000, including 15,000 Moroccan Jews and 42,000 Europeans (35,000 Spaniards, 6,000 French, 1,000 others); (1954 est.) 183,000. Languages: Arabic, French and Spanish. Religion: mainly Moslem. Pop. of Tangier city, about 100,000. Administrator in 1955, Robert van de Kerchove d'Hallebast (Belgium). Sultan's representative (*mendub*), Haj Mohammed el-Tazi.

History.—In March 1954 Prince Étienne de Crouy-Roeulx (Belgium) had been designated administrator of the Tangier zone, but because of ill health he renounced his appointment. On Jan. 4, 1955, the committee of control nominated Robert van de Kerchove d'Hallebast, who was then serving as Belgian minister at Ankara. On May 23 Julius Cecil Holmes was appointed U.S. diplomatic agent at Tangier with minister's rank. Sultan Mulay Mohammed ben Arafa, who in Oct. 1954 had bought a palace at Tangier, retired there when he abdicated on Sept. 30, 1955. Mokhtar Aharhan, president of the Unity and Independence party of Tangier, was received on Nov. 29 at Rabat by Sultan Mohammed V ben Youssef. The party stood for the abolition of the international zone and the restoration of Moroccan territorial unity.

Economy.—Currency equivalent to metropolitan franc (350 fr.=U.S. \$1). Budget (1954 est.): revenue 2,130,000,000 fr.; expenditure (ordinary) 1,600,000,000 fr., (extraordinary) 413,000,000 fr. Foreign trade (1953): imports 11,628,000,000 fr.; exports 969,000,000 fr. Shipping handled in the port of Tangier (1952): ocean-going ships entered 382 (546,000 gross tons), coasters entered 2,786 (1,555,000 gross tons). Roads (1954) about 104 km. Telephones (Jan. 1954) 9,546.

Tariffs. Notwithstanding that a few changes of importance were made during the year, 1955 was primarily a period of stability, rather than of basic change, of the tariff structure of the world. Among the more significant activities relating to world tariffs were those centred around the operations of the G.A.T.T. organization (General Agreement on Tariffs and Trade). These activities, however, related primarily to the administration of programs previously undertaken and to the continuation or expansion of projects already under way, rather than to extensive changes of tariff policy or of prevailing tariff levels. Both gains and losses were experienced by the G.A.T.T. membership in its general objective of liberalizing world trade. Unilateral tariff action instituting important changes in the tariff schedules of individual countries occurred much less frequently than in any year during the decade. Most tariff changes of consequence made by individual countries during the year were by non-G.A.T.T. members and the general effect of such changes was to increase prevailing rates of duty.

The General Agreement on Tariffs and Trade.—Activities of G.A.T.T. were among the major developments in the field of tariffs and international commercial policy during 1955. At the ninth session of the contracting parties to the General agreement, held at Geneva, Switz., from Oct. 1954 to March 1955, the contracting parties proposed the establishment of an Organization for Trade Cooperation (O.T.C.), which would provide a permanent agency for administering the general agreement; they also revised the G.A.T.T. code of trade rules and extended until the end of 1957 the firm life of the tariff concessions in the general agreement. Negotiations for the accession of Japan to the general agreement were completed in June; accordingly, Japan became a contracting party on Sept. 10, thus increasing the number of G.A.T.T. members to 35. In the latter

part of the year, the contracting parties announced a fourth round of tariff negotiations to begin early in 1956.

The Projected Organization for Trade Cooperation.—At their ninth session the contracting parties initiated measures to create an official administrative agency to be known as the Organization for Trade Cooperation (O.T.C.). An agreement to create such an organization was opened for signature by the G.A.T.T. members at Geneva in March 1955. Should the O.T.C. be established by the G.A.T.T. members, functions that had been exercised jointly by them, in sessions of the contracting parties and at meetings of the intersessional committee, would become the responsibility of the O.T.C. In effect, the O.T.C. assembly would replace the sessions of the contracting parties; similarly the executive committee would function in place of the intersessional committee. The O.T.C. would serve, for example, as an intergovernmental forum for consultations on questions relating to international trade and G.A.T.T. obligations. The periodic multilateral tariff negotiations that had been sponsored by the contracting parties would be sponsored by the O.T.C. It would study questions relating to international trade and commercial policy and make appropriate recommendations thereon. It would also collect, analyze and publish statistical data and other information relating to international trade and commercial policy. The O.T.C., however, would have no authority to amend the provisions of the General agreement, or to impose on a member any obligations other than those in the provisions of the General agreement.

The new organization would consist of an assembly, an executive committee and a secretariat. The assembly would be comprised of all members of the O.T.C. The executive committee, which would provide a continuing organization between meetings of the assembly, would consist of 17 members of the O.T.C. elected periodically by the assembly. According to its provisions, the agreement would enter into force when accepted by countries accounting for 85% of the foreign trade conducted by the G.A.T.T. members. Since the United States accounted for more than 20% of such foreign trade, the O.T.C. could not come into existence unless the United States accepted it. As of late Oct. 1955 the agreement had been signed definitively by Greece and *ad referendum* by Chile, west Germany, the Netherlands, Turkey and the United States.

Revision of the G.A.T.T. Code.—At earlier sessions of the contracting parties to the General agreement, various G.A.T.T. members had suggested that, in light of the experience gained from the operations of the agreement as well as the demise of the International Trade organization (ITO), a review of the G.A.T.T. code (the general provisions) should be undertaken. In 1954 the members decided that the review of the trade rules would be held at their ninth session.

In their review, completed in 1955, the contracting parties reaffirmed the basic objectives and obligations of the General agreement—including the principle of nondiscrimination in international trade and the general prohibition against the use of quantitative restrictions on imports. In addition, numerous changes were made in the trade rules; many of them, however, constituted only technical alterations designed to correct or clarify certain provisions or to bring the rules into conformity with the proposed O.T.C.

Perhaps the most significant amendments made by the G.A.T.T. members were those which modified the provisions respecting quantitative restrictions (articles 11 and 12) and altered the rules relating to government assistance for economic development (article 18). As amended, the G.A.T.T. rules continued to prohibit the use of quantitative restrictions on imports, except (as had been the case previously) such restrictions might be used, temporarily, to safeguard a country's bal-

ance of payments or to effect a necessary increase in its monetary reserves. The proposed amendment, however, would require all countries employing quantitative controls to submit regularly to an examination of such restrictions to determine whether their policies conformed to the rules of G.A.T.T. and to assess the effect of their restrictions on other G.A.T.T. members. The projected O.T.C. would be authorized to recommend modifications of any restrictions inconsistent with the rules and to authorize retaliatory action against an offending member, if that member would not suitably modify its restrictions.

Because of the desire of the so-called underdeveloped countries to promote industrialization of their economies, the G.A.T.T. rules governing governmental assistance for economic development were completely revised. In general, the modified rules would permit freer use of protective import duties and other import restrictions when instituted to encourage the establishment of new industries.

The amendments to the G.A.T.T. code were embodied in three protocols that were opened for signature in March. Certain of the amendments were to become effective upon acceptance by all of the G.A.T.T. members, and the others upon their acceptance by two-thirds of the membership. As of Sept. 1, Chile, the Federal Republic of Germany, the Netherlands, Greece and the United States had signed the three protocols; the first three countries signed *ad referendum*.

Extending the Firm Life of Concessions.—During the review of the General agreement, the G.A.T.T. members agreed to extend the firm life of the numerous tariff concessions previously granted in negotiations sponsored under the General agreement; accordingly, the validity of the concessions was prolonged from July 1955—the then effective expiration date—to the end of 1957. It was also agreed that, thereafter, the tariff concessions would automatically be rebound for three-year periods unless two-thirds of the members voted otherwise. The G.A.T.T. members again adopted rules to permit renegotiation of individual tariff concessions at the close of each three-year period, as well as during such periods under special circumstances (so-called article 28 renegotiations). In each instance, the G.A.T.T. member taking article 28 action would be required to negotiate with other members having a principal trade interest in the items involved. In such renegotiations, the G.A.T.T. rules envisaged that the general level of tariff concessions granted by the country taking article 28 action or through the retaliatory withdrawal of concessions by the country or countries affected. Although individual concessions could thus be withdrawn or modified, the action of the G.A.T.T. members in extending the firm life of the concessions served to assure a measure of stability of tariff rates covering a substantial portion of world trade.

Before extending the firm life of the G.A.T.T. tariff schedules, the contracting parties were permitted under the provisions of article 28 to renegotiate any of the individual tariff concessions that they had granted. A considerable number of members, including Austria, Belgium, Canada, Cuba, the Dominican Republic, Finland, France, India, the Netherlands, Nicaragua, Pakistan, Peru and Sweden, indicated an intention to modify or withdraw certain concessions. To that end, renegotiations among the respective countries were scheduled; although the renegotiations were to be completed by Sept. 30, the results of such action had not been announced at that time.

Tariff Negotiations Under G.A.T.T.—From Feb. to June 1955 tariff negotiations for the accession of Japan to the General agreement were held at Geneva, Switz. In the negotiations between Japan and the United States, tariff concessions were granted by each on articles accounting for about half the value

of the imports from the other.

Following the conclusion of the tariff negotiations, the G.A.T.T. members were asked to vote on Japan's accession to the general agreement. All of the 34 members voted in favour of Japan's accession and, on Sept. 10, that country became a contracting party to the General agreement. Although voting for Japan's accession, 14 of the G.A.T.T. members that had not negotiated with Japan gave formal notice, as permitted by article 35, that their trade relations with Japan would not be governed by the provisions of the General agreement. Consequently, these countries among other things would not be required by the provisions of G.A.T.T. to extend to Japan most-favoured-nation treatment or to apply to imports from Japan the tariff concessions that they had previously granted in earlier negotiations. These countries, moreover, would not be bound by the G.A.T.T. rules should they decide to increase their tariffs or impose additional restrictions on imports from Japan. The 14 countries that invoked article 35—including several major trading countries—were Australia, Austria, Belgium, Brazil, Cuba, France, Haiti, India, Luxembourg, the Netherlands, New Zealand, the Rhodesia-Nyasaland federation, the Union of South Africa and the United Kingdom.

During the summer and fall of 1955 the contracting parties formulated plans for a fourth major round of tariff negotiations, to be held early in 1956. The chief factor governing the timing of new negotiations was the passage of legislation by the United States congress granting the president additional authority to negotiate tariff concessions. Most of the G.A.T.T. members were expected to participate in the negotiations.

General Tariff Revisions.—During 1955 Honduras, Nicaragua, Bolivia, Rhodesia, Brazil, Austria, Denmark, Sweden and Switzerland either completed or were in processes of making general revisions of their tariffs. Honduras and Nicaragua completed such revisions and both adopted the new N.A.U.C.A. nomenclature (*Nomenclatura Arancelaria Uniforme Centroamericano*) as a basis for their tariff commodity classification. These two countries not only consolidated various duties and surcharges into a single rate of duty for a given item, but also made increased utilization of ad valorem duties to bolster the declining revenues previously obtained from specific-type duties. Late in 1954 Bolivia published a new tariff, relying largely on its old tariff classification; the new schedule provided for higher rates of duty on most items. In July 1955 the Federation of Rhodesia and Nyasaland announced a new tariff schedule. The federation had considered joining in a customs union with the Union of South Africa, but decided instead to adopt a multiple-column tariff, with the rates of duty in the two lower columns being applicable, respectively, to the United Kingdom and colonial territories, and to the British dominions. The new schedule afforded additional protection to selected domestic industries. General tariff revisions were also completed in Formosa, Vietnam and Somalia.

During the year several countries, including Austria, Brazil, Denmark, Sweden and Switzerland, were in process of revising their tariffs. Of these, Austria, Brazil and Switzerland announced that they were utilizing the Brussels nomenclature as the basis of their new tariff classifications. Moreover, Austria, Denmark and Brazil indicated that they were making predominant use of ad valorem rather than specific duties. By the close of the year no concrete proposals had been made regarding the projected Swedish tariff, but it was expected that higher rates of duty would be recommended.

Less Extensive Modifications.—The following countries made piecemeal revisions which increased import duties on a substantial number of items: Finland, Greece, Bolivia, Chile, Colombia, Ecuador, Guatemala, Mexico, Syria, Lebanon, Egypt,

Liberia and Malaya. Few of these countries were members of G.A.T.T. and, hence, most of them were free to take unilateral action without the obligation of consultation. The somewhat extensive upward revisions of duties by a number of these countries (e.g., Finland and Greece) involved the adjustment of specific duties to compensate for the decreased purchasing power of domestic currencies; in other countries (e.g., Colombia, Ecuador and Lebanon) the increases reflected the desire of the respective governments to afford additional protection to selected domestic industries; and in still others (e.g., Liberia and Malaya) the higher rates of duty were imposed largely for the purpose of increasing government revenues. The most extensive modification of an individual country's tariff by cumulative piecemeal action in recent years had, in effect, resulted in an across-the-board revision of Mexico's tariff providing generally for increased rates of duty.

During the year no country effected a general reduction in duty. Germany and Costa Rica, however, reduced duties on an extensive number of import items; in both cases, the modified duties were in effect adjustments of rates which only recently had been applied when the respective country completely revised its tariff.

United States Tariff Policy.—There was no striking departure from policies which had been pursued by the United States in the immediately preceding year or any significant alteration in the prevailing level of duty. Some further liberalization of tariff rates was achieved through negotiations under the trade agreements program; on the other hand, various United States measures, unilateral in character, resulted in additional import restrictions.

Trade Agreement Proceedings.—During the year the United States extended somewhat the scope of its trade agreement concessions through the aforementioned negotiations with Japan, the new concessions becoming effective in September. In other negotiations at Geneva, from April to June, concessions were granted to Switzerland to compensate that country for the increased import duties that the United States had imposed on watches and watch movements in 1954 under the escape-clause procedure. In midyear the United States and Philippine congresses approved the revision of the 1946 trade agreement between the two countries. Bilateral trade agreements with Guatemala and Ecuador were terminated.

In January the president requested that his authority to negotiate tariff reductions with other countries be extended for a three-year period. The president's request followed in large part recommendations made in 1954 by the Commission on Foreign Economic Policy (the Randall commission). He stated that the legislation should authorize: (1) reduction of tariff rates by not more than 5% in each of three successive years; (2) reduction of rates in excess of 50% ad valorem, or its equivalent, to that level in three annual stages; and (3) reduction by one-half of rates in effect on Jan. 1, 1945, on products that were not being imported or were being imported in negligible amounts. The Trade Agreements Extension act of 1955, as enacted, granted the president the authority to reduce tariff rates as set forth in items (1) and (2) above, but not as in item (3). The authority to reduce tariff rates was not cumulative; for example, if the president should fail to reduce a given duty by 5% during the first year (ending June 30, 1956), that portion of his authority would lapse. The administration, therefore, began planning new trade agreement negotiations. In April the president requested that the congress authorize United States membership in the Organization for Trade Cooperation. The congress, however, did not take action during the year.

Import Restrictions.—During the first nine months of the year the United States tariff commission had pending before

it eight investigations under the escape-clause provisions of the Trade Agreements act, as amended. Under the law, if the commission found that a domestic industry was being seriously injured or threatened with serious injury as the result of the customs treatment reflecting a trade agreement concession, the president could impose increased import duties or an import quota. The number of investigations thus undertaken in 1955 was much smaller than in any of the previous three years, when the number of escape-clause investigations before the commission varied from 15 to 22. By the end of September the commission had completed five of the eight investigations. In two instances the commission recommended the imposition of increased import duties. Pursuant to these recommendations, the president imposed higher import duties on alsike clover seed and bicycles.

Under the provisions of section 22 of the Agricultural Adjustment act, the tariff commission conducted four investigations during the first nine months of 1955. Section 22 permits the president to impose fees or quotas on imports of commodities if the commission finds that imports of the products concerned interfere materially with programs administered by the department of agriculture. By the end of September the commission had completed all of the investigations. In response to the commission's recommendations, the president imposed a quota on imports of rye, rye flour and rye meal and removed or liberalized previous import restrictions imposed under the provisions of section 22 on filberts and peanuts to permit larger imports of those products.

In response to congressional legislation, the United States import duties on certain fish sticks and on tennis shoes were increased during 1955. To compensate the foreign countries to which the United States had trade agreement obligations on those products, concessions on other products were granted to Canada and to the Netherlands during the course of the negotiations sponsored by the contracting parties at Geneva in the early part of the year. (See also INTERNATIONAL TRADE.)

(D. L.H.; G. P. H.)

Taxation. In 1955 rising personal income and corporate profits in the United States increased the current and prospective level of federal government receipts. To a smaller extent federal expenditures also exceeded the estimates made in the budget presented in January, largely because of unexpected increases in expenditures for agricultural price support programs. For the fiscal year ending June 30, 1955, budget receipts were \$60,303,000,000, budget expenditures were \$64,494,000,000 and the deficit was \$4,192,000,000. For the fiscal year ending June 30, 1956, it was estimated in August that the deficit would be reduced to \$1,732,000,000, as compared with the estimate of \$2,408,000,000 made in January. This reduction in the estimated deficit, combined with prospects of further increases in receipts and continued efforts by the administration to reduce expenditures, gave rise to speculation that a tax cut would be possible in 1956, perhaps with a balanced budget.

U.S. Legislation.—Because of the substantial current deficit, Pres. Dwight D. Eisenhower recommended in January and congress passed in March a measure to postpone for one year reductions in the corporation income tax rate and in various excises which had been scheduled for April 1, 1955. At the time of this extension, the house of representatives voted a \$20 per capita credit against the individual income tax but this measure was rejected by the senate.

Other tax legislation was of lesser importance. Congress passed more than 20 tax bills, nearly all of which amended in some respect the internal revenue code of 1954. Among these were the repeal of two provisions of the code dealing with prepaid income and estimated expenses, repeal of the excise tax on

"HOW LONG IT TAKES TO EARN YOUR INCOME TAXES," a 1955 editorial cartoon from the *Chicago Tribune* (Ill.). Figures are based on net income after exemptions for a single person without dependents

radios, television sets, phonographs, etc., used for business purposes (except entertainment), repeal of the excise tax on motorcycles and extension of the retirement income credit to servicemen under 65 who get military pensions. In addition, the house of representatives passed 22 other tax bills which were not acted on by the senate.

U.S. State Taxation.—Except for Kentucky and Virginia, all the states held legislative sessions in 1955, and the volume of tax legislation was unusually large. This reflected the pressure for expanded services and the tendency of state expenditures to exceed revenues. State tax collections in the fiscal year 1955 totalled \$11,584,000,000, which was an increase of 4.5% over 1954. The table shows collections from various taxes and the percentage distribution for the fiscal year 1955. Collections in the fiscal year 1955 were largely unaffected by the tax rate increases enacted in 1955.

Various increases were enacted in general sales taxes, the largest single source of state revenue. Illinois, Iowa, Mississippi, South Dakota, Tennessee and Washington increased their sales tax rates. Wyoming removed certain use tax exemptions. Connecticut, North Dakota and Rhode Island extended their sales taxes for two years. Nevada for the first time adopted a general sales tax.

In West Virginia a previous reduction in the occupational gross income tax was cut from 10% to 5%.

Motor fuel taxes were increased in Alabama, Connecticut, Georgia, Iowa, Maine, Michigan, Montana, Nevada, New York (subject to voters' approval of a new highway bond issue), North Dakota, Texas, Vermont and West Virginia. California, Nebraska and Pennsylvania extended "temporary" higher rates. Kansas and Oklahoma made their temporary rates permanent. Utah adopted a four cents per gallon tax on jet fuels.

Motor vehicle and operators' license fees were increased in Arizona, Idaho, Indiana, Maryland, Minnesota, Montana (on trucks and buses), Nevada, North Dakota, Tennessee and Wyoming. Colorado revised its ton-mile tax on trucks.

Alcoholic beverage tax rates were increased in Alabama, California, Georgia, Maine, Maryland, North Carolina, South Carolina and Texas. A 7.5% surcharge was imposed on liquor sales

in Idaho. In Iowa beer and in South Dakota alcoholic beverages were made subject to the sales and use tax. Maine and Washington made permanent several of their temporary alcoholic beverage taxes. Indiana levied a \$30 additional fee on alcoholic beverage permits.

Alabama, Georgia, Idaho, Maine, Mississippi, New Mexico, South Dakota, Texas, Washington and Wisconsin increased their cigarette taxes. Missouri and Oregon levied cigarette taxes for the first time, subject to voter approval. In Iowa cigarettes were made subject to the sales and use tax.

Michigan extended its business receipts tax to Dec. 31, 1955. In New York the governor vetoed extension of the temporary 1% reduction in the unincorporated business tax. The business and occupations tax was increased in Washington and West Virginia. Delaware, Georgia, Minnesota and West Virginia increased fees or taxes on insurance companies, and Mississippi levied a surtax on its insurance company tax. Idaho doubled corporation license fees. Alabama, Maine, Mississippi and Utah increased corporation franchise rates.

Idaho imposed a new schedule of tax rates on gross intrastate receipts of public utilities. Rhode Island assessed public utilities annually at 45% of the expenses of the Public Utilities administrator's office. West Virginia reduced from 10% to 5% a credit formerly allowed on the utilities tax. Washington made permanent a 10% surtax on the existing utilities tax.

Corporate income tax rates were increased in Iowa, Maryland, Minnesota, South Carolina, Utah and Vermont. Idaho and Mississippi imposed surtaxes on their rates, and Idaho also repealed a 15% credit previously allowed. Connecticut and Rhode Island extended their "emergency" rates on corporate income. Georgia reduced its corporate rate from 5.5% to 4% but disallowed deduction of the federal income tax.

A surtax on individual income tax rates was imposed in Idaho (where also a 15% credit was repealed), Mississippi, Oregon and Wisconsin. Rates were increased in Alabama (by constitutional amendment to be approved by the voters), Iowa and Vermont. Georgia reduced its individual income tax rate in the higher brackets.

Colorado, Montana and South Dakota increased their state property taxes. Nebraska extended a one-half mill state property tax levy for teacher retirement. In Utah the state levy for schools was increased by about six mills. Wyoming repealed or reduced certain property tax exemptions. A statewide equalization and reassessment program was authorized or strengthened in Arkansas, Idaho, Montana, Nevada, New Mexico and Washington.

Similar programs were considered in other states.

Idaho and Maine increased their tax on potatoes. Florida increased its tax on grapefruits and adopted a new tax on limes

and avocados. Nevada increased its gambling tax, and West Virginia raised its pari-mutuel taxes. Utah levied a new 1% tax on gas and oil production. Minor changes in state taxes were made by many states.

Canada.—In April 1955, in his annual financial statement, Walter Harris, the minister of finance, announced that for the fiscal year ending March 31, 1955, total budgetary revenues were \$4,107,000,000, expenditures \$4,301,000,000 and the deficit \$194,000,000.

For the fiscal year ending March 31, 1956, he estimated revenues at \$4,350,000,000 on the basis of existing tax rates, expenditures at \$4,362,000,000, and a deficit of \$12,000,000. On tax policy Harris introduced a novel proposal. He estimated that if the economy were operating at full capacity in 1955, the gross national product would amount to a little more than \$26,000,000,000, although he forecast that the realized gross national product in 1955 would be \$25,250,000,000. He then recommended "a tax structure which, as closely as I can estimate, would produce a balanced budget if we had a gross national product of about \$26 billion."

The major tax reductions were as follows: (1) a reduction in standard corporate income tax rate from 47% to 45% effective Jan. 1, 1955; (2) a two percentage point reduction, effective July 1, 1955, in each bracket rate of the personal income tax, which for most taxpayers meant a reduction of 12% to 13% in the tax payable; (3) a reduction from 15% to 10% in the special excise tax on automobiles and repeal of the excise tax on tires and tubes; (4) certain additions to exemptions from the general sales tax. The revenue loss from these changes was estimated at \$207,000,000 in a full year and \$148,000,000 in the fiscal year 1955-56. Including the effect of these tax reductions the deficit for the fiscal year 1955-56 was estimated at \$160,000,000. (H. J. Mr.)

Taylor, Maxwell Davenport (1901-), U.S. army officer, was born on Aug. 26 at Keytesville, Mo., and was graduated from the U.S. military academy at West Point, N.Y., in 1922. Later he studied at the army's engineer and field artillery schools, at the Command and General Staff school, Fort Leavenworth, Kan., and at the Army War college in Washington, D.C. After three years in Hawaii (1923-26) he transferred to the field artillery. He taught at the U.S. military academy from 1927 to 1932 and later (1945-49) was academy superintendent. He was stationed at Tokyo, Japan, from 1935 to 1939.

After U.S. entry into World War II Taylor helped train the first U.S. air-borne divisions and was made artillery commander of the 82nd air-borne division which participated in the Sicilian and Italian campaigns. In March 1944, prior to the Normandy landings, he became commander of the 101st air-borne division, which saw some of the war's fiercest fighting, including the Battle of the Bulge in Dec. 1944.

After his retirement as superintendent of West Point, Taylor was U.S. commandant in Berlin, Ger. (1949-51), and assistant, then deputy army chief of staff in charge of operations (1951-53). In Feb. 1953 he took command of the U.S. 8th army in Korea, soon being advanced to the rank of full general. After the Korean armistice in July 1953 Taylor remained to assure observation of the armistice terms and to direct the rehabilitation of South Korea. He became commander of the U.S. army far eastern forces on Nov. 20, 1954.

On May 13, 1955, Pres. Dwight D. Eisenhower named Taylor chief of staff of the U.S. army, to succeed Gen. Matthew B. Ridgway as of June 30.

Tea. Production and consumption of tea apparently increased in 1955; the price situation became erratic. No reliable current data were available on China's undoubtedly large production, estimated for 1952 at 400,000,000 lb. as compared with more than 600,000,000 lb. before World War II, of which about 80,000,000 lb. were exported.

Tea prices, which had been increased six times in the U.K. in 1954, ran into strong consumer resistance early in 1955 at the \$1 to \$1.15 per pound level, as the government refused to reintroduce price controls. Major auctions, Calcutta, Colombo, Cochin and Chittagong, were also depressed as north India tea for the London auctions was restricted to 140,000,000 lb. and Ceylon restored export quota restrictions on medium- and high-grade teas at 55,000,000 lb. India increased the export duty

on tea. Retail tea prices in the U.S. increased to an average of 40.3 cents per quarter pound in mid-1955, as compared with an average price of 34.2 cents in 1954.

Apparently most consuming countries dipped into reserves. The U.K. continued to take about 50% of the export tea. Imports of tea into the U.S. in 1954 reached an all-time high of 115,000,000 lb., 6.5% above the previous year and valued at about \$63,000,000. Tea imports into the U.S. Jan.-Aug. 1955 were 69,966,960 lb. as compared with 87,022,870 lb. in the same period of 1954. U.S. average consumption continued at .68 lb. per capita as in 1954. Canadian consumption was 4.43 lb. per capita for those 15 years and older, or about 45,000,000 lb. total in 1954.

The International Tea agreement expired in March.

(J. K. R.)

Telegraphy. The telegraph industry in the United States in 1955 had one of the busiest and most progressive years in its history. Having completed its nationwide network of high-speed message centres through which messages flash coast-to-coast automatically, without manual relay, the industry concentrated on further wide-scale expansion of facsimile and on meeting the continued upsurge of demands for private wire systems for volume telegraph users.

Desk-Fax.—By the end of 1955 Western Union Telegraph company had placed compact Desk-Fax facsimile machines in the offices of about 26,000 firms, providing businessmen with the means of sending and receiving telegrams instantly in picture form by pressing a button. Another 23,000 business offices were equipped with Western Union teleprinter printing telegraph machines. These Desk-Faxes and teleprinters were serving nearly 50,000 customers, all directly connected with Western Union's high-speed electronic network.

Intrafax.—Intrafax (facsimile systems leased to customers) are used by a wide variety of businesses throughout the nation to connect their scattered departments, offices and buildings with fast and efficient communications. The newest form of Intrafax sends and receives a standard size letter in less than three minutes and transmits brief memoranda in a matter of seconds, eliminating bottlenecks in intracompany communications.

Ticketfax.—Another newly developed electronic facsimile system, Ticketfax, was placed in use to flash Pullman and reserved

Statistics of the Telegraph Industry, U.S.

(Fiscal Year Ended Dec. 31, 1954)

Item	Amount	Item	Amount
Gross operating revenues	\$222,288,218	Average hourly earnings of employees, apart from messengers	\$1.86
Income from operations (after federal income tax)	\$9,384,986	Miles of telegraph circuits	3,439,479
Telegraph offices and agencies	24,816	Miles of carrier-equipped telegraph circuits	2,711,312
Number of employees	39,128	Nautical miles of ocean cable	30,258
Salaries, wages, social security taxes, pensions and other benefits	\$140,013,781		

coach tickets from one railroad station to another and provide the tickets almost instantaneously to customers at the counter. This system, which was helping to revolutionize railroad reservations and speed ticket sales, delivered a ticket in eight seconds ready for immediate use by the passenger.

Private Wire Networks.—During 1955, more than 1,500,000 mi. of circuits were used in private wire networks leased to American business firms. Revenues from private wire services had grown from \$11,500,000 in 1950 to \$27,000,000 in 1955, an increase of 126%. The largest new networks placed in operation in 1955 were in the trucking, aviation, air line, railroad, paper, aluminum, fruit and vegetable and oil industries.

The most recent stimulant to the sale of private wire systems was their growing use for automation, or integrated data processing. This enabled industry to expedite and co-ordinate its sales, production, shipping, accounting and other operations, and provided efficiency never before possible. Systems which were being installed included a 12,000-mi. network for Sylvania Electric Products, Inc. This nationwide system, the first designed specially for integrated data processing, linked 51 cities with Sylvania's data processing centre at Camillus, N.Y. A 9,600-mi. transcontinental network linking 20 cities, being installed for E. F. Hutton and Co., one of the leading stock brokerage concerns, was completely automatic and included many radically new features to meet brokerage needs for maximum speed and accuracy.

Radio Beam System.—In 1948 Western Union installed and put into operation the world's first commercial microwave transmission network, linking New York city, Philadelphia, Pa., Washington, D.C., and Pittsburgh, Pa. During 1955 the company was extending its microwave system to Cincinnati and Chicago.

Submarine Cables.—Western Union announced it had reached an agreement on basic terms governing the sale of its cable system to Tectron American, Inc., subject to the execution of a definitive agreement and to necessary regulatory, stockholder and other approvals. The purchase price would be based on net book value of the properties plus net current assets, which combined were approximately \$18,000,000.

Financial.—Western Union split its stock 4-for-1 on May 17, 1955, one of the considerations being the aim to increase investor interest in the company. In less than four months the number of the company's share owners increased 20%. It also refunded its entire bonded indebtedness, issuing \$38,500,000 of 25-yr. 4½% debentures to replace \$35,000,000 5% bonds maturing in 1960, and \$2,000,000 4¾% debentures due in 1980. The company offered an additional 1,000,000 shares of stock to the share owners. These were promptly subscribed for, and the proceeds were being used to finance plant expansion. (See also FEDERAL COMMUNICATIONS COMMISSION.) (W. P. MA.)

Telephone. At the end of 1955 there were an estimated 101,000,000 telephones in the world. Of these, approximately 56,000,000 were in the United States.

Thirteen countries had more than 1,000,000 telephones each. In addition to the U.S., they were the United Kingdom (with more than 6,500,000 phones), Canada (with more than 4,000,000),

the German Federal Republic, France, Japan, Sweden, Italy, Australia, Switzerland, Argentina, the Netherlands and Spain.

U.S. Telephone Statistics

(As of July 1, 1955)

	Bell system*	Total U.S.
Number of telephones	44,557,000	54,315,000†
Dial telephones	37,946,000	44,500,000
Manual telephones	6,611,000	9,815,000
Miles of wire	189,110,000‡	209,200,000
Number of central offices	9,621	20,738
Average daily conversations (Jan.-June 1955)	169,000,000	205,000,000
Total investment in plant and equipment	\$14,660,645,000	\$16,800,000,000

*American Telephone and Telegraph company and its principal telephone subsidiaries. †In addition to Bell system, includes: Bell Associated (Southern New England and Cincinnati & Suburban Bell Telephone companies), 1,420,000; Bell Service (principally telephones on rural or former lines connecting directly with Bell system), 338,000; Independent (4,800 companies), 8,000,000. ‡96% in cable.

In March Bell system overseas service was extended to Ascension Island in the South Atlantic, in November to French Equatorial Africa and in December to Oman, on the Arabian peninsula, bringing the total number of connecting countries or territories to 112. This made it possible for a telephone user in the U.S. to call any one of 97,000,000 telephones throughout the world. About 84% of all U.S. telephones were dial operated.

Transoceanic Cables.—In 1955 work was progressing on three underwater twin-cable systems, between North America and the United Kingdom, Alaska and Hawaii. Farthest along was the project which would span the Atlantic between Newfoundland and Scotland—a distance of 1,950 nautical miles. A joint undertaking of the American Telephone and Telegraph company, the British post office and the Canadian Overseas Telecommunication corporation, it would provide 36 telephone channels and was scheduled to go into service late in 1956. Construction work had started on the one linking Port Angeles, Wash., and Ketchikan, Alsk.—800 mi. away. Similar to the Atlantic cable in many respects, it would also supply 36 telephone channels and would be completed late in 1956. The third cable system, which would stretch 2,100 mi. from Koko head in the Hawaiian Islands to Point Reyes, Calif., was in the planning stage and was expected to be completed in 1958. Cables on the floors of oceans make overseas telephoning more reliable because cables are not subject to atmospheric disturbances that sometimes affect radiotelephone.

Financing.—The total investment in telephone plant and equipment reached \$17,150,000,000 by Sept. 30, 1955. For example, in the fall of 1955, the American Telephone and Tele-

SOLAR POWER operating telephone equipment at Americus, Ga., in Sept. 1955. The lineman is shown adjusting the solar battery

FIRST SECTION OF TRANSATLANTIC TELEPHONE CABLE being hauled ashore at Clarenville, Nfd., in June 1955

graph company, parent company in the Bell system, sold a \$637,165,800 issue of convertible debentures. This was the largest single corporate financing job ever undertaken by any business. With more than 1,400,000 share owners, the Bell system was the most widely owned of all businesses.

Harnessing the Sun.—The Bell solar battery, the first successful device to convert sunlight directly and efficiently into electricity, underwent further development during 1955. In April Bell laboratories announced that the battery's efficiency had been almost doubled, to 11%. This was said to be comparable with that of the best gasoline engines and more than 20 times higher than that of the best photovoltaic devices available. In October tests began of a new type of rural telephone system powered by the solar battery. The experiment was being conducted near Americus, Ga.

Defense Developments.—Announced during the year was TRADIC—short for "transistor digital computer." It is an electronic brain especially devised to go into an aeroplane. It can make thousands of calculations a second while the plane is in flight. Instead of vacuum tubes it uses hundreds of tiny transistors, an invention of Bell laboratories. The transistors enable the machine to operate on less than 100 w.—one-twentieth of the power needed by comparable vacuum-tube computers. It appeared that when design work had been completed, the machine would probably occupy less than three cubic feet of space in a modern military aircraft.

At the request of the U.S. air force, a project to integrate U.S. radar and defense weapons into a nation-wide semiautomatic system was begun. When completed, it would include numerous centres where radar information would be electronically computed to guide defensive weapons.

Thousands of communications channels would be needed to provide the interconnecting network.

Just below the Arctic circle, across the northern rim of the North American continent, construction started on the Distant Early Warning line—a series of radar stations to give the U.S. and Canada advance warning of an air attack. Western Electric,

manufacturing and supply unit of the Bell system, was prime contractor for the U.S. air force in construction of the radar fence, a joint venture of Canada and the U.S.

Tennessee. A south central state of the United States, 16th to enter the union, Tennessee is called the "Volunteer state." Land area, 41,797 sq.mi., water area about 447 sq.mi. Population (1950): 3,291,718; rural 1,839,116; urban 1,452,602; rural farm 1,016,204; white 2,760,250; non-white 531,468. The July 1, 1955, estimated population was 3,399,000. The population of principal cities in 1950: Nashville (cap.) 174,307; Memphis 396,000; Chattanooga 131,041; and Knoxville 124,769.

History.—Major legislation enacted by the 1955 general assembly included an increase in the sales tax from two cents to three cents, with the increase earmarked for education; increase in gasoline tax and automobile registration fees; increased appropriations for teachers' salaries and highways; and a strict antigambling bill. Efforts to reapportion representation in the general assembly met with defeat, despite a constitutional requirement that the state be reapportioned every ten years. Tennessee's last reapportionment was in 1907.

The most serious labour strife in many years accompanied strikes against the Louisville and Nashville railroad, the Nashville, Chattanooga and St. Louis railway and the Southern Bell Telephone and Telegraph company in March, April and May 1955. Cable slashings, dynamiting and derailment of the N. C. & St. L. passenger streamliner, the "Dixie Flyer," accompanied the strikes. More violence occurred in a strike against the Serbin Garment company in Fayetteville.

The state board of education began the process of desegregation of schools by calling on state colleges and the University of Tennessee, Knoxville, to end segregation on the graduate level in the fall term of 1955, and extending this policy to college freshman classes in the fall of 1959. Desegregation of public elementary and high schools was left in the hands of local school boards.

Frank G. Clement was re-elected governor in Nov. 1954 and began his second term in January. Other chief state officers were: lieutenant governor, Jared Maddux; secretary of state, G. Edward Friar; treasurer, Ramon Davis; comptroller, William R. Snodgrass; attorney general, George F. McCanless; and adjutant general, Joe Henry, Jr.

Education.—Enrolment in elementary and high schools during the school year 1954-55 was 740,933, with an average daily attendance of 663,738. The total number of public-school teachers was 25,307. Grand total expenditures for public schools from all sources during 1953-54, the latest year for which figures were available, were \$125,632,905; for special schools \$1,218,100; and for six state colleges and the University of Tennessee \$10,783,198.12 out of state funds. The commissioner of education was Quill Cope.

Social Insurance and Assistance, Public Welfare and Related Programs.—During 1954 the total amount of unemployment compensation was \$37,538,200 for 1,994,728 man-weeks of unemployment. Other public assistance during 1954-55 totalled \$46,761,244.80, of which \$28,222,611.90 was for old-age assistance, \$16,260,168.90 for dependent children, \$1,623,583.20 for aid to the blind and \$654,880.80 for disabled persons. As of June 30, 1955, there were 65,694 recipients of old-age assistance, 21,102 dependent children, 3,292 blind and 1,469 disabled persons receiving public assistance.

In 1954-55 there were 4 juvenile and correctional institutions with 694 inmates and expenditures of \$734,195.77; 3 penal institutions with 2,774 inmates and expenditures of \$1,621,207.77; and 3 state hospitals for the insane with an average population of 7,420 inmates and expenditures of \$4,112,150.38.

Communications.—Of the 70,064 mi. of public roads on Dec. 31, 1954, 8,202 were state highways. There were 56,433 mi. of county rural roads and 4,367 mi. of county urban roads. State and federal parks and reser-

vations contained an additional 1,062 mi. of roads. Total highway expenditures were \$98,059,196 of which \$54,200,206 was from the state, \$26,303,951 from counties and \$17,555,039 from municipalities. There were 3,443.34 mi. of railroad on Oct. 1, 1955.

Banking and Finance.—On June 30, 1955, there were 219 state banks with 58 branches and assets of \$752,455,697.02; and 76 national banks with assets of \$1,901,714,000. Savings and loan associations on June 30, 1955, numbered 43 with total assets of \$326,450,154.16. Of these 42 were federal associations with assets of \$325,968,688.51.

Total state revenue from all sources in 1954-55 was \$276,583,464.33. Federal aid was \$59,026,713.74. Proceeds from bonds sold were \$5,350,000, and debt outstanding decreased \$5,686,000 to a total of \$113,845,000 on June 30, 1955. Of total disbursements from state appropriations of \$291,934,679.49, \$85,770,159.37 was for education, \$51,671,720.26 for highways, \$51,388,002.43 for public welfare and \$35,172,741.79 for cities and local governments. Accrued surplus on June 30, 1955, was \$36,748,484.62.

Table I.—Principal Crops of Tennessee

Crop	Indicated 1955	1954	Average 1944-53
Corn, bu..	60,410,000	40,484,000	59,793,000
Oats, bu..	9,630,000	8,906,000	6,144,000
Soybeans, bu..	3,700,000	2,160,000	2,333,000
Barley, bu..	1,866,000	1,578,000	1,445,000
Hay, tons	1,868,000	1,311,000	1,908,000
Peanuts, lbs.	2,400,000	2,175,000	3,948,000
Tobacco, lbs.	126,800,000	148,118,000	143,556,000
Apples, bu..	94,000	376,000	388,000
Peaches, bu..	—	355,000	478,000
Pears, bu..	—	151,000	115,000

Agriculture.—Tennessee had another drought year in 1954 with a drop in farm income from \$484,937,000 in 1953 to \$478,130,000 in 1954. Income from livestock and products was \$224,982,000; from crops \$244,522,000; and from government payments \$8,626,000. During 1954, 147,814 ac. of forestland were burned by 5,492 forest fires. Estimated forest area in Oct. 1955 was 12,916,000 ac.

Manufacturing.—The total estimated value of manufactures in 1954 was \$3,344,000,000, a decline of \$211,000,000 from 1953. An estimated 281,000 persons were engaged in manufacturing in 5,100 establishments. Total wages paid to persons covered by unemployment compensation were \$882,956,288. In July 1955, 179,500 persons were engaged in the manufacture of nondurable goods and 103,300 in the manufacture of durable goods. Leading employing industries were chemicals with 47,000, textiles with 34,400, fabricated metal products and ordnance with 20,700 and lumber with 21,500.

(W. T. A.)

Table III.—Mineral Production of Tennessee

(In short tons, except as noted)

Mineral	Quantity 1953	Value 1953	Quantity 1952	Value 1952
Cement (bbl.).	7,277,000	\$18,283,000	7,429,000	\$17,834,000
Clays	1,037,000	3,479,000	1,042,000	3,519,000
Coal	5,467,000	25,152,000	5,265,000	25,560,000
Coke*	231,000	?	254,000	?
Lime	114,000	1,177,000	100,000	1,005,000

Sand and gravel	5,231,000	5,270,000	5,173,000	5,303,000
Stone	10,485,000	16,948,000	10,377,000	17,653,000
Zinc	38,000	8,847,000	38,000	12,623,000
Other minerals	...	7,589,000	...	6,129,000
Total	...	\$98,050,000	...	\$100,932,000

*Values for processed materials are not included in the totals.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Tennessee in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Tennessee was first among the states in output of pyrite, second in phosphate rock, fifth in zinc and ranked 26th in the value of its mineral output, with 0.68% of the U. S. total.

Tennessee Valley Authority. The Tennessee Valley authority's multiple-purpose dam and reservoir system averted nearly \$1,000,000 of flood damage early in 1955, while traffic on the waterway steadily increased. In March the crest of a moderate flood was lowered by 13.5 ft. at Chattanooga, Tenn., and by lesser amounts elsewhere in the valley, saving \$400,000 damage; regulation of the Tennessee river outflow averted \$580,000 damage in the lower Ohio and Mississippi basins. Total flood damage averted since 1936, only a partial measure of flood-control benefits, reached \$59,846,000, or about one-third of the original cost of the flood-control facilities. Traffic on the river reached 1,250,000,000 ton-miles in 1954, with savings to shippers of \$14,000,000. Traffic in the first seven months of 1955 was 895,000,000 ton-miles, 27% higher than the same period of 1954.

More than half the 42,044,954,000 kw.hr. sold by TVA in the fiscal year 1955 went to federal defense agencies, chiefly the Atomic Energy commission. The federal agencies received 21,770,451,000 kw.hr., compared with 11,800,000,000 kw.hr. the year before. Installed generating capacity of the integrated system increased by 1,734,300 kw. This brought the system total to 7,809,985 kw., of which 3,502,735 kw. was in hydro plants and 4,307,250 kw. in steam plants. Continuing construction, mainly to supply the Atomic Energy commission, was expected to bring the total installed capacity to 9,039,985 kw. by Dec. 31, 1955.

With power revenues of \$188,163,000, net operating revenues of \$47,901,000 in the fiscal year amounted to a return of about 4½% on the net average power investment, somewhat above the 4% annual average of the past 22 years. TVA paid \$50,000,000 to the U. S. treasury, partly to the general fund and partly to retire bonds, bringing the total of such payments to \$151,132,000. After June 30, 1955, a \$14,000,000 payment retired the last of \$65,000,000 of bonds.

Municipal and co-operative systems, purchasing 13,556,622,000 kw.hr. for distribution to 1,376,000 consumers, had revenues of \$138,500,000 and a combined net income of \$24,100,000. They added 43,000 consumers during the year, half in rural areas. Average annual use per residential customer exceeded 5,200 kw.hr. compared with about 2,650 kw.hr. in the nation as a whole.

Industry continued to draw upon the results of TVA's research in chemical engineering for fertilizer and munitions development, particularly in the expansion of phosphorus production facilities. About 350,000 tons of fertilizer materials were produced in the fiscal year and distributed in 36 states in an experimental sales program and farm test demonstrations, de-

"THE NATIVES DO SEEM TO BE A BIT UNFRIENDLY," a 1955 cartoon by Yardley of the *Baltimore Sun* (Md.)

signed to help improve fertilization and land-use practices and encourage the demand for improved commercial fertilizers.

During fiscal 1955 TVA, working with 14 state agencies, provided about 15,000,000 seedlings for planting on 15,000 ac. of valley lands by 4,000 landowners. About 280,000,000 seedlings had been provided by TVA for planting on 240,000 ac., about one-sixth the valley area needing reforestation. The value of nonfederal recreation facilities and equipment along TVA lakes increased to \$47,700,000, including 300 boat docks and 12 state and 50 local parks.

The TVA board of directors consisted in 1955 of Brig. Gen. Herbert D. Vogel, ret., chairman, Harry A. Curtis and Raymond R. Paty. (See also ELECTRICAL INDUSTRIES.)

(K. R. K.)

Tennis. The outstanding play of Tony Trabert, who won the French, British and U.S. titles, and the brief eight months' tenure of the Davis cup by the U.S., marked the year 1955 in amateur tennis. A month after he became U.S. champion for the second time, Trabert accepted an offer by Jack Kramer to join his professional troupe.

Davis Cup.—Trabert and E. Victor Seixas, Jr., 1954 U.S. champion, surprised Australia's team of Kenneth Rosewall, 1954 Australian champion, and Lewis Hoad to win the 1954 Davis Cup Challenge round at White City stadium, Sydney, Austr., Dec. 27-29, 1954. Before record-breaking daily crowds of more than 25,000, the Americans won 3 matches to 2 as they broke Australia's four-year reign. Just eight months later Australia regained the cup when its team of Rosewall, Hoad and Rex Hartwig, captained by Harry Hopman, scored a decisive 5-0 victory over the U.S. team of Trabert, Seixas and Hamilton Richardson, captained by William F. Talbert. The matches were played at the stadium of the West Side Tennis club, Forest Hills, N.Y., Aug. 26-28, 1955. Many Australians were in the crowds which nearly filled the 13,500-seat stadium each day. Thirty-four nations challenged for the cup in 1955.

Men's Singles.—Trabert won his titles at Wimbledon, Eng., Forest Hills and the U.S. Clay court at Atlanta, Ga., without the loss of a set, an exceptional performance. In the final at Wimbledon he beat Kurt Nielsen of Denmark, 6-3, 7-5, 6-1; at Forest Hills he defeated Rosewall, 9-7, 6-3, 6-3, for the U.S. championship, and at Atlanta he beat the defending champion, Bernard "Tut" Bartzen, 10-8, 6-1, 6-4. Trabert won the French championship by defeating Sven Davidson of Sweden in a four-set final. Trabert also won the last two tournaments in which he competed as an amateur. In the Pacific Southwest at Los Angeles, Calif., he beat Herbert Flam in the final and in the Pacific Coast at Berkeley, Calif., he defeated Seixas for the title.

Men's Doubles.—By their victories at Wimbledon and in the Challenge round and other Davis cup ties, the Australian pair of Hoad and Hartwig replaced Seixas and Trabert as the world's foremost doubles team. The Australians repeated their 1955 Davis Cup Challenge round victory over the American pair by defeating them in another five-set match in the Pacific Southwest final. Seixas and Trabert won the French doubles over Italy's rising Davis cup stars, Nicola Pietrangeli and Orlando Sirola, and early in the year the Americans won the Australian title. Hurricane weather forced postponement of the U.S. doubles championships at the Longwood Cricket club, Chestnut Hill, Mass., in August and with the Challenge round in the offing several of the top seeded teams had to withdraw. In the scramble for the title left undefended by Seixas and Trabert, a Japanese team for the first time emerged victorious. Kosei Kamo and Atsushi Miyagi, Japan's Davis cup team, defeated the young Americans Gerald Moss and William Quillian in a five-set final.

Women's Champions.—With the continued retirement of former champion Maureen Connolly (now Mrs. Norman E.

Brinker), the important women's titles were distributed. Louise Brough won her fourth singles title at Wimbledon, defeating Mrs. Beverly Baker Fleitz in the final. Doris Hart retained her U.S. title by beating Patricia Ward, Great Britain. It was the first time since 1931 that an English girl had reached the final of the U.S. championship. Angela Mortimer, Great Britain, won the French crown. In the final she defeated Mrs. Dorothy Head Knode, U.S. Miss Mortimer also defeated Miss Hart in the Wightman cup matches played at the Westchester Country club in Rye, N.Y., although the favoured U.S. team (Misses Hart, Brough, Shirley Fry and Mrs. Knode) won again, 6 to 1. The English girls between them won the doubles in three important tournaments in the U.S.—Essex, Maidstone and Pacific Coast—and Miss Mortimer won the singles over Shirley Bloomer in the latter tournament. For the first time in many years two English teams reached the final of the women's doubles at Wimbledon when Miss Mortimer and Anne Shilcock defeated Misses Ward and Bloomer. Resuming where they left off in 1950 after setting a record of nine successive U.S. doubles championships, Miss Brough and Mrs. Margaret Osborn du Pont captured their tenth title at the Longwood Cricket club. They defeated Misses Hart and Fry who had held the title for the last four years.

Miss Hart set a record by winning both the British and U.S. mixed doubles championships for the fifth successive year. The first two years she was partnered by Frank Sedgman and the last three years by Seixas.

(E. S. Br.)

Texas. Texas is a west south central state of the United States, bordered on the southeast and southwest by the Gulf of Mexico and Mexico, respectively. It became a state through annexation Dec. 29, 1845, of the republic of Texas, 1836-45. Known as the "Lone Star state" from the single star in the flag of the republic, it is the largest state in the union. Land area 263,513 sq.mi., inland water 3,826 sq.mi.; total 267,339 sq.mi. Population: (1950 census) 7,711,194; (U.S. census est. July 1, 1955) 8,351,000. Urban population (1950) 4,838,060, or 62.7%; total rural 2,873,134, or 37.3%, divided into 1,580,867 nonfarm rural and 1,292,267 farm rural; white 6,726,534, nonwhite 984,660. Capital, Austin, with 132,459 pop. (1950). Other cities ranked by population in 1950: Houston 596,163; Dallas 434,462; San Antonio 408,442; Ft. Worth 278,778; El Paso 130,485; Corpus Christi 108,287; Beaumont 94,014; Waco 84,706; Amarillo 74,246; Lubbock 71,747; Wichita Falls 68,042.

History.—Scandal involving the \$100,000,000 state bond issue to help war veterans purchase farm lands was the principal political development of 1954-55. State Land Commissioner Bascom Giles and several citizens in private life were charged with bribery and misappropriation of public funds. Giles, who had been re-elected state land commissioner in 1954, declined to qualify with the oath of office in Jan. 1955, soon after charges had been brought against him, and J. Earl Rudder was appointed by the governor in his place. Giles was convicted during 1955 in district courts at Austin and San Antonio and given three- and six-year prison sentences, respectively. These cases were on appeal as of Oct. 15, 1955.

The 54th legislature convened in regular session Jan. 11, 1955, and adjourned June 7 after a 148-day session. During the session 1,431 bills were introduced, of which 551 were passed. Notable among them were laws (1) putting tighter regulation on life, fire and casualty insurance companies, (2) reorganizing the state health department with abolishment of the office of state health officer and creation of the office of state commissioner of health, (3) creating a Texas commission on higher education to survey the whole field of tax-supported state universities and colleges and (4) 23 laws which, in effect, were amendments of the Texas water code. A serious drought and

JOHN NANCE GARNER, former vice-president of the U.S., watching chickens feeding on his ranch at Uvalde, Tex., where he was interviewed in 1955 after a report that he might return to Washington, D.C., to attend a testimonial dinner for speaker of the house of representatives Sam Rayburn

municipal water shortage prevailed in most of the state during 1954 and 1955, and there was lengthy legislative debate in an attempt at a complete recodification of the Texas water laws, which only partly succeeded.

The 54th legislature submitted nine constitutional amendments to be voted on by the people Nov. 6, 1956. The most important of these proposed (1) broadening tax powers of the county commissioners' courts, (2) giving the legislature wider authority to use its own discretion in providing old-age and other assistance, (3) providing for different procedure in trial of lunacy cases, including waiver of jury trial, (4) providing greater freedom in investing the permanent fund of the University of Texas and the Agricultural and Mechanical college, which, on Aug. 31, 1955, amounted to \$226,273,156, and (5) reorganizing the Veterans' Land board, increasing regulation of its activities and increasing from \$100,000,000 to \$200,000,000 the amount of bonds it may issue for assisting in the veterans' land-purchase program.

The principal state officials for the term ending Dec. 31, 1956, were: governor, Allan Shivers; lieutenant governor, Ben Ramsey; attorney general, John Ben Shepperd; comptroller of public accounts, Robert S. Calvert; treasurer, Jesse James; state commissioner of education, J. W. Edgar (indefinite appointive term).

Education.—The scholastic population for the school year 1954-55 was 1,781,027 (preliminary figure). Administration under the Texas Education agency was through 991 independent and 954 common school districts. The number of teachers (1953-54) was 63,495; average salary \$3,484.35. All revenues for public school operation totalled \$441,073,763.

Social Insurance and Assistance, Public Welfare and Related Programs.—At the end of the fiscal year, Aug. 31, 1955, there were 224,004 recipients of old-age assistance with an average of \$38.22 monthly per recipient, according to the state public welfare department. There were 69,246 dependent and neglected children, representing 23,610 families, with average assistance of \$19.22 per child or \$56.36 per family. There were 6,519 receiving aid to the blind, with average of \$41.31 per person. Beginning in Sept. 1955 old-age payments were raised \$4 and aid to the blind \$3 monthly, as the result of a constitutional amendment adopted in Nov. 1954 raising the public welfare fund limit from \$35,000,000 to \$42,000,000, for the fiscal year beginning Sept. 1, 1955.

Transportation and Communications.—The Texas public road system on Aug. 31, 1955, totalled approximately 200,000 mi., including all types, according to the state highway department. There were 16,500 mi. in the federal-aid primary system, 10,500 mi. of state highways and 26,000 mi.

of farm-to-market roads, the remaining mileage being locally maintained. In the combined federal, state and farm-to-market systems, as of Aug. 31, 1955, there were 45,900 mi. of asphalt, concrete and brick paving. Total receipts to the highway department for the year ended Aug. 31, 1955, were \$190,516,110. Total disbursements were \$192,497,898, of which \$137,452,580 was for construction, \$38,696,225 for maintenance and \$16,349,093 for administration, highway patrol and miscellaneous expense. Total motor vehicles registered for the year ending March 31, 1955, were 3,781,235.

There were on Jan. 1, 1955, 15,324 mi. of first main line railroad track in the state and 6,251 mi. of auxiliary track. Total airports recorded with the Civil Aeronautics administration numbered 654 as of May 31, 1955, with 47 in use by standard air lines. Shipping at Texas Gulf ports for the calendar year 1954 amounted to 4,333,634 tons of foreign imports and 9,961,084 tons of exports; 5,169,327 tons of receipts in coastwise domestic shipping and 79,918,107 tons of outbound shipments (largely between Gulf ports and Atlantic seaboard); 13,101,149 tons of internal shipping receipts (Gulf Intracoastal canal) and 14,745,405 tons of outbound shipments. As of Jan. 1, 1955, there were 2,398,521 telephones in the state.

State Government and Private Finance.—State government receipts for the fiscal year ended Aug. 31, 1955, were \$838,009,264. Texas has neither state income tax nor general sales tax. Total expenditures by the state for the year ended Aug. 31, 1955, were \$777,558,950 for the following purposes: education, including administration, eleemosynary-educational and higher education, \$299,464,274; public welfare, \$157,270,375; highway construction and maintenance, \$189,363,084; eleemosynary-correctional, \$45,214,615. The state's authorized bonded debt was \$104,000,000, including \$100,000,000 of veterans' land purchase bonds. On Jan. 1, 1955, there were 441 national banks in Texas with \$8,295,685,966 resources and \$7,698,690,443 deposits. There were 465 state banks with \$1,981,482,580 resources and \$1,851,723,724 deposits. The total was 906 banks with \$10,277,168,546 resources and \$9,550,414,167 deposits.

Table I.—Leading Agricultural Products of Texas

Crop	Indicated 1955	1954	Average 1944-53

Agriculture.—Total Texas crop acreage, 1955 (August estimate), was 23,100,000, as against 24,884,775 in 1954. Total 1955 income from crops (basis of six months' estimate) was \$964,224,000, income from livestock \$776,000,000; total 1955 estimated income from crops and livestock, \$1,740,224,000. Income from crops, 1954, was \$1,063,201,000, income from livestock \$774,880,000; total, \$1,838,081,000.

The number and value of livestock on farms, Jan. 1, 1955, were as follows: all cattle, 8,501,000, valued at \$561,066,000; milk cows, 1,031,000, valued at \$96,914,000; hogs, 1,087,000, valued at \$23,588,000; sheep, 5,331,000, valued at \$53,829,000; goats, 2,249,000, valued at \$12,370,000; horses, 252,000, valued at \$9,828,000; mules, 68,000, valued at \$2,584,000; chickens, 21,388,000, valued at \$19,249,000; turkeys, 621,000, valued at \$2,794,000.

Source: U.S. Department of Commerce, Annual Survey of Manufactures, 1953.

Manufacturing and Industry.—Employment and net value of production of leading Texas industries, 1953 and 1952, were as shown in Table II, according to the U.S. department of commerce Annual Survey of Manufactures.

Employment in manufacturing in Texas on Aug. 31, 1955, was 442,800, as compared with 426,800 on Aug. 31, 1954, according to the Texas Employment commission, Austin. Leading industries as indicated by

employment on Aug. 31, 1955, were: food, 61,600; transportation equipment, 57,200; petroleum products, 48,000; chemicals, 40,900; machinery, 38,200; apparel, 31,400; lumber and wood products, 26,900; printing and publishing, 26,500; primary metals, 26,400. (S. McG.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Texas in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Texas was far in the lead among

the states in output of natural gas and petroleum and was also first in bromine and sulphur, third in cement and potash, fourth in gypsum and fifth in clay. Texas has the only commercial production of helium in the world. It was first among the states in the value of its mineral output in 1953, with 25.37% of the U.S. total.

Textile Industry. Consumption of the four major textile fibres (cotton, wool, silk and the man-made fibres) in the United States for 1952 through the first half of 1955 is shown in Table I.

Table I.—United States Fibre Consumption

(In millions of pounds)

	1952	1953	1954	1st half 1955
Raw cotton	4,437	4,521	4,124	2,212
Raw wool*	478	505	392	214
Apparel class	358	369	277	149
Carpet class	120	136	115	65
Raw silk	7	5	6	4
Man-made fibres†	1,470	1,522	1,497	949
Rayon plus acetate	1,215	1,223	1,155	732
Noncellulosic‡	255	299	342	217
Total, four fibres	6,392	6,553	6,019	3,379

*Scoured basis. †The rayon plus acetate data are U.S. producers' domestic shipments plus imports for consumption, while the noncellulosic fibre data are U.S. producers' production less exports plus imports for consumption. ‡Includes nylon, acrylic, polyester, polyethylene, polyvinyl-acetate, protein, saran and textile glass fibre for textile applications.

During the first half of 1955, consumption rose to an annual rate of about 6,800,000,000 lb. or 13% over 1954. These recent data compare with a 1939 consumption figure of 4,500,000,000 lb.

The relative importance of the various fibres as percentages of total consumption had changed significantly since pre-World War II days. In 1939, for example, cotton represented 80% of the poundage of all fibres consumed; by 1955, cotton's share had fallen to 66%, in spite of the fact that its poundage consumption had increased 794,000,000 lb. or 22% over the period. Wool's prewar share was 9% of the total, but this dropped in 1955 to 6%.

Use of the man-made fibres, on the other hand, rose sharply from a 10% share in 1939 to 28% in 1955; poundagewise, consumption increased 1,439,000,000 lb. or 314%. Prior to the war, the only man-made fibres of commercial importance in the United States were rayon and acetate. Since then, the noncellulosic fibres had become increasingly important.

Prices.—Textile fibre prices remained fairly steady during the first half of 1955 except for wool, which showed a steady downward trend. Table II shows the annual averages from 1950 through Sept. 1955.

Wool prices were characterized by great fluctuations over the period, rising to a high of \$3.75 a pound in March 1951, then dropping to \$1.58 only 13 months later. After increasing to \$1.77 per pound in Sept. 1954, there was a steady downward trend to a new low of \$1.32 in Sept. 1955.

Cotton also reached its peak of 45.2 cents about the same time as wool, as a result of the Korean outbreak the year before. The price trend then was downward until the end of 1953, when a slight upturn occurred. Late in 1954, the trend again was downward.

Rayon filament yarn prices were remarkably steady over the period, holding at 78 cents a pound from Jan. 1951 until March 1955 when the price was raised to 83 cents. Rayon staple prices

Table II.—Selected Textile Prices in the United States*

(In cents per pound)

Annual Averages	Raw Cotton		Raw Wool	Raw Silk	Rayon Yarn	Rayon Staple
	Cotton	Wool				
1950	36.2	199.2	349.4	73.2	36.1	
1951	41.4	270.5	480.5	78.0	40.0	
1952	38.8	165.3	515.6	78.0	39.7	
1953	32.9	172.9	539.5	78.0	35.0	
1954	34.1	170.6	492.0	78.0	34.0	
1955†	33.6	146.5	464.4	81.7	34.0	

*Cotton is the 10-market spot price for 1½-in. middling cotton, except for 1955 which relates to the new 14-market average basis. Wool is fine-grade territory wool, scoured basis, at Boston, Mass. Silk is the 20-22 AA grade. Rayon yarn is 150-denier viscose rayon yarn, Rayon staple is 1½-denier, 1½-in. bright viscose rayon staple. †First nine months of 1955 only.

reached a high of 40 cents a pound in Jan. 1951, which price held until Nov. 1952 when the price was lowered to 37 cents. A further decrease to 34 cents was put into effect in April 1953.

Silk prices reached a high of \$5.62 a pound in Feb. 1951. After several cycles of lower and higher prices, an upswing began in May 1955, which brought the price to \$4.85 in August.

Broad Woven Goods.—Broad woven goods constitute the most important single branch of the textile fabricating industry in the United States and Table III delineates the production of that industry for the years 1952-1954 and for the first half of 1955.

Table III.—Broad Woven Goods and Tire Cord Production

	1952	1953	1954	1st half 1955
Broad woven fabrics (millions of linear yards)				
Cotton fabrics	9,515	10,203	9,768	5,045
Man-made fibre fabrics*	2,294	2,405	2,242	1,288
Woolen and worsted fabrics†	351	339	279	158
Total	12,160	12,947	12,289	6,491
Tire cord and fabric (millions of pounds)				
Cotton (except chaffer fabric)	91	16	13	34
Nylon	8	19	30	
Rayon	384	429	324	201
Cotton chaffer fabric	48	57	46	26
Total	531	521	413	261

*Including silk. †Excluding carpets, rugs and felts.

Output in the first half of 1955 was at an annual rate of nearly 13,000,000,000 yd., 6% above 1954 and approximately equal to 1953.

Total output of tire cord and fabric tended downward from 1952 to 1954, but showed a good recovery in the first half of 1955.

Per Capita Fibre Consumption.—Civilian per capita consumption of cotton, wool and the man-made fibres in the first

Table IV.—U.S. Civilian Per Capita Consumption of Certain Textile Fibres

(In pounds)

Year	Total	Man-made	Wool	Cotton
1950	40.4	9.2	4.4	26.8
1951	36.4	8.5	2.6	25.3
1952	34.9	8.5	3.1	23.3
1953	36.2	8.6	3.4	24.2
1954	32.6	8.2	2.6	21.8
1955*	36.6	10.5	2.9	23.2

*First half 1955 data multiplied by two to determine the annual rate.

half of 1955 was at an annual rate of 36.6 lb., a gain of 4 lb. over 1954 but 3.8 lb. below the postwar peak of 40.4 lb. per person in 1950, as shown in Table IV. Per capita consumption of man-made fibres hit an all-time annual high rate of 10.5 lb. per person in the first half of 1955, greater by 1.3 lb. per person than the previous high in 1950.

These per capita data are calculated as the mill consumption of the fibres, minus exports and plus imports of fabricated products, and less unusual military consumption, all divided by the population.

Imports and Exports.—Exports of all textile fibres and products thereof from the United States amounted to \$1,416,000,000 in 1954, an increase of 21% over the 1953 total of \$1,167,000,000. The 1954 imports were valued at \$795,000,000 or 14% less than the 1953 total of \$926,000,000. For the first half of 1955, however, imports increased to an annual rate of \$967,000,000 or 22% above 1954, while exports decreased to an annual rate of \$1,322,000,000 or 7% below the 1954 total.

The largest United States export items are raw cotton and manufactured textiles of cotton and the man-made fibres. Among imports, the most important categories are raw wool and manufactured wool textiles, although rayon staple imports also are significant.

Canadian Textile Developments.—During the first half of 1955, the Canadian textile industry showed increased output in all three main weaving divisions (cotton, woollen and worsted, and man-made fibres).

Production of cotton broad woven fabrics during the first six months of 1955 was at an annual rate of about 280,000,000 yd. as compared with 255,000,000 yd. and 268,000,000 yd. in 1954 and 1953 respectively. Imports in 1954 totalled 210,000,000 yd., making the Canadian industry's share of the total Canadian market about 55% compared with 53% in 1953. The major part of the cotton fabric imports was from the United States, although the supply from Japan was growing.

Production of man-made fibre fabrics in Canada during the first five months of 1955 was at an annual rate of 100,000,000 yd., or 10,000,000 yd. more than in 1954. With imports at the rate of about 28,000,000 yd. a year, the Canadian industry of the total Canadian market was 78% in 1955 and 77% in 1954 compared with 91% in both 1950 and 1951.

Here, too, the United States was the chief supplier of the imported fabrics.

Woollen and worsted fabric output during the first part of 1955 was at an annual rate of about 20,000,000 yd., slightly above the 19,000,000 yd. produced in 1954 but below the 22,000,000 yd. of 1953. Imports were also an important factor in this group, totalling about 12,000,000 yd. in 1954 and 16,000,000 yd. in 1953. Hence the Canadian producers' share of the total Canadian market was 61% in 1954 and 58% in 1953. Practically all of the Canadian imports of woollen and worsted fabrics were from the United Kingdom. (See also LINEN AND FLAX; SILK; WOOL.) (S. B. H.)

Thailand (SIAM). A kingdom of southeastern Asia, Thailand is bounded west and northwest by Burma, northeast and east by Laos and Cambodia and south by Malaya. Area: 198,270 sq.mi. Pop.: (1947 census) 17,442,689; (1955 est.) 20,302,000. Language: Thai (Siamese) 74%; Chinese 20%; Indian and Malayan 6%. Religion (1947 est.): Buddhist 95%; Moslem 4%. Capital (1947 census): Bangkok 620,830. Ruler, King Phumiphon Adundet (or Bhumibol Aduladej); prime minister in 1955, Marshal Pibul Songgram.

History.—External policy in 1955 was primarily concerned with the danger of communist aggression. Relations with Burma, Laos and Cambodia were developed further. In the speech from the throne on June 24 the king stated that the Burmese government was being given facilities to enable it to eliminate the remaining foreign troops along the Burma-Thailand border and that technical and economic aid was being given to Laos and Cambodia. Thailand and Laos signed a temporary customs agreement which came into force on Nov. 1, and the railway to Udon in northeastern Thailand was extended to Nongkhai on the Mekong river only a short distance downstream from Vientiane, the administrative capital of Laos. On Feb. 24 agreement was reached to make Bangkok the headquarters of the South-

east Asia Defence Treaty council, and to set up a secretariat there, though not a military headquarters. The council and its committees held a number of meetings in Bangkok during the year.

The foreign minister attended the Asian-African conference at Bandung, Indonesia, in April.

The balance of power within the government appeared to shift during the year. The prime minister, Marshal Pibul, left on April 14 on a world tour from which he returned on June 22. Soon after his return a scandal broke out over opium. The allegations involved General Phao, who was chief of police, deputy minister of finance and deputy minister of the interior, and had been spoken of as likely to succeed Pibul in the near future. On Aug. 3 Pibul added to his own portfolios that of minister of the interior and made a number of ministerial changes which involved relieving Phao of his post as deputy minister of finance and bringing the deputy commander in chief of the army and the commander of the First army in the Bangkok area into the government. As minister of the interior and minister of defense Pibul made it clear that he intended to exercise direct control over both police and army. He announced measures to stop opium smuggling and official corruption, which he regarded as damaging to Thailand's prestige abroad, and to introduce a greater measure of democracy. He also lifted the press censorship operated by the police. Provincial council elections were held in July under the provisions made at the end of 1954 for new legislative bodies in the provinces. On Sept. 20 the house of assembly passed a bill to authorize the formation of political parties and several parties were subsequently registered with the ministry of the interior. A general election was promised for 1957.

The economic position improved during the year because of increased exports of rice and improved prices for rubber and tin. Many of the controls on trade and exchange were abolished or simplified. The German steel firm of Krupps was commissioned to survey the possibilities of establishing an iron and steel works at Kanchanaburi, and the International Bank for Reconstruction and Development approved a loan of U.S. \$12,000,000 to finance railway development. A reparations agreement was concluded with Japan. (A. S. B. O.)

Education.—Schools: state primary (1954) 19,331, pupils (1951) 2,857,411, teachers (1951) 79,627; state secondary (1954) 267, pupils 96,300; pupils at private secondary schools 110,797. Institutions of higher education (1954) 5, including one university with 10,656 students in 1952.

Finance and Banking.—Monetary unit: *baht* or *tical*, with a buying rate of 21.56 baht to the U.S. dollar and a selling rate of 21.73 baht to the U.S. dollar (from Sept. 1955). Budget (1955 est.): revenue 4,180,000,000 baht, expenditure 5,416,000,000 baht. Currency circulation (Dec. 1954) 4,548,000,000 baht, (March 1955) 4,863,000,000 baht. Bank deposits (May 1954) 1,461,000,000 baht, (Nov. 1954) 1,416,000,000 baht. Gold and foreign exchange (Dec. 1954) U.S. \$273,000,000, (June 1955) U.S. \$316,000,000.

Foreign Trade.—(1954) Imports 1,798,000,000 baht, exports 1,184,000,000 baht. Main sources of imports (1953): U.S. and Canada 19%; Japan 17%; Malaya and Singapore 11%; Hong Kong 12%; U.K. 13%; other continental European Payments Union countries 21%. Main destinations of exports (1953): Malaya and Singapore 29%; Japan 25%; U.S. and Canada 21%; Hong Kong 15%; continental E.P.U. 3%. Chief exports (1954): rice 49%; rubber 16%; tin 7%.

Transport and Communications.—Roads (1953) 6,700 km. Motor vehicles in use (1951): cars 11,000; commercial vehicles 7,000. Railways (1954): 3,354 km.; traffic (1953) 2,294,000,000 passenger-km.; freight (1954) 669,200,000 ton-km. Shipping (1953): merchant vessels of 500 gross tons and over 10, gross tonnage 13,900. Air transport (1954): 41,032,000 passenger-km.; freight, 1,808,000 ton-km.; km. flown (1953) 2,652,000. Telephones (Jan. 1954) 8,020. Radio receiving sets (1949) 74,000.

Agriculture.—Main crops (metric tons, 1954): rice 5,800,000; sugar, crude brown 19,000; soybeans 20,000; sesame 9,900; peanuts 92,000; cotton, lint (1953) 9,000, (1954 est., 9,000); cottonseed 18,000; tobacco (1953) 49,800. Livestock (1953): cattle 5,548,734; buffaloes 5,402,210; pigs 3,327,281; horses 213,868; elephants 12,695; poultry 46,061,371. Fish landings (metric tons, 1953): 205,000.

Industry.—Electricity production (Bangkok only, 1954) 156,840,000 kw.hr. Production (metric tons, 1954): rubber (exports) 118,600; tin concentrates (metal content) 9,930; cement 383,400; tungsten ore (metal content, 1953) 1,054. Estimated cotton cloth output (1954): 40,000,000 yd.

Theatre. The year 1955 proved an active and profitable one in the theatre in the United States and one that the majority of the critics decided was slightly above the post-World War II average as far as artistic achievement was concerned.

The problems caused by the shortage of playhouses in Manhattan (there were only 25 available in the Broadway district), rising production costs and the resulting rise in theatre ticket prices remained unsolved, and dramatists, it appeared, had been cautioned to confine the action of their plays to one set and to bear in mind possible motion-picture sales. One affluent producer, stung by the severe press reception that greeted his negligible staging of a negligible musical comedy, announced his retirement.

Both the Pulitzer prize and the Drama Critics' circle prize were again awarded to the same play, *Cat on a Hot Tin Roof* by Tennessee Williams, a sensational and bluntly spoken melodrama about a decaying southern household and its prospective heir, an incipient homosexual who had taken to the bottle to avoid the amorous attentions of his determined wife. Though often substituting violence and lurid language for dramatic strength, it contained some of Williams' best "mood" writing and was brilliantly directed by Elia Kazan and brilliantly acted by a capable company headed by Ben Gazzara, Barbara Bel Geddes, Burl Ives and Mildred Dunnock.

Bus Stop by William Inge, a comedy about some travellers who spent the night in a Kansas diner when a March blizzard halted their journey, demonstrated its author's unique talent for amusing observation and skill at transforming everyday chatter into arresting dialogue. Two young playwrights, Jerome Lawrence and Robert E. Lee, found immediate success with their initial effort, *Inherit the Wind*, a dramatization of the farcical Scopes "monkey" trial of 30 years ago. Craftsmen of promise, these collaborating novices caught persuasively both the spirit of the trial and the personalities of its well-known chief figures, William Jennings Bryan, Clarence Darrow and H. L. Mencken. Paul Muni, until illness forced his retirement from the cast, gave one of the year's outstanding performances as Darrow, and Ed Begley's Bryan and Tony Randall's Mencken were memorable characterizations.

The suspense play enjoyed a renaissance, and among the profitable melodramas were Guy Bolton's adaptation of the French play *Anastasia*, concerning the adventures of the tsar's surviving daughter in Berlin; Maxwell Anderson's thriller about a nine-year-old girl who is already a homicidal maniac, *The Bad Seed*; Joseph Hayes's *The Desperate Hours*, in which gangsters invade a middle-class home and hold its inhabitants prisoners; and *Witness for the Prosecution*, an Agatha Christie version of a murder trial, imported from London.

There were no new comedies of extraordinary merit. Sidney Kingsley's rowdy sex farce *Lunatics and Lovers* found a following, but Harry Kurnitz' mildly diverting satire of art collectors, *Reclining Figure*, did not, and Noel Coward's costumed frolic about runaway couples, *Quadrille*, ran for only a few months despite the presence of the Lunts.

Christopher Fry's adaptation of Jean Giraudoux's *La Guerre de Troie n'aura pas lieu*, entitled *Tiger at the Gates*, was the most successful of the more serious plays brought from abroad, while the quick failures in this category included Fry's own play *The Dark Is Light Enough*, Paul Vincent Carroll's Irish fantasy *The Wayward Saint*, Jacques Deval's *Tonight in Samarkand* and Ugo Betti's *Island of Goats*.

The demand for bright musical shows was satisfied by *Fanny*, S. N. Behrman's adaptation of Marcel Pagnol's plays of the Marseilles waterfront set to music by Harold Rome with Ezio Pinza in the leading role; Cole Porter's *Silk Stockings*, based on

Melchior Lengyel's play, *Ninotchka*, which Greta Garbo had played on the screen, a hilarious caricature of Soviet officials having their first glimpse of the west; *Plain and Fancy*, a quaint and melodious operetta with an Amish hamlet in Pennsylvania as its background; *Damn Yankees*, with a score by Richard Adler, which told how a baseball fan sold his soul to the devil; and the British *The Boy Friend*, a parody of musical comedies of the 1920s.

Gian-Carlo Menotti's fine opera with its scene of New York's Little Italy, *The Saint of Bleecker Street*, thrilled the critics and once more revealed its creator's dual talent for musical and dramatic composition, but it was unable to attract the paying playgoers and closed after a desperate struggle. *House of Flowers*, for which Truman Capote wrote the libretto and Harold Arlen the music, an entertaining and handsomely staged show dealing with romance in the West Indies, ran through the season but failed to earn back its original investment, and the musical *Peter Pan* with Mary Martin as its star left much to be desired.

The off-Broadway theatres continued to thrive, drawing eager audiences with their productions of Shakespeare, Chekhov, Schnitzler and Wedekind.

A 1955 event of importance was the United States' initial participation in the International Festival of Dramatic Arts in Paris. Backed by the approval of the United States government, the U.S. theatre was represented by Thornton Wilder's *The Skin of Our Teeth* with Helen Hayes and Mary Martin, Robinson Jeffers' *Medea* with Judith Anderson, and a production of the Richard Rodgers-Oscar Hammerstein II musical comedy *Oklahoma*, directed by Rouben Mamoulian. (T. Q. C.)

*The theatrical season is considered to begin Aug. 1 and end July 31.
†The peak season on Broadway.

Canada.—The third annual Shakespearean festival at Stratford, Ont., was the main focus of Canadian theatre interest in 1955, although the year was a lively and satisfying one for drama people throughout the whole country. The Stratford festival drew 126,500 customers and a \$421,000 box office for its nine summer weeks of *Julius Caesar*, *The Merchant of Venice* and *Oedipus Rex*, directed by Tyrone Guthrie and Michael Langham. The Dominion Drama festival, held at Regina, Sask., May 9-14, brought into competition eight top-flight amateur theatre groups from all parts of Canada. Winner was the University of British Columbia Players Club Alumni, presenting Arthur Miller's *The Crucible*. The festival had its first woman adjudicator in 23 years, Gerda Wrede, an outstanding actress from Finland and drama teacher and managing director of the noted Helsinki Swedish theatre.

Of special interest to Canadians was the trip to France of Montreal's Théâtre du Nouveau Monde, at the invitation of the Paris drama festival. It was the first time a Canadian company had ever been invited to this distinguished European event, and Paris' tough drama critics were notably warm in their approval of the Canadian offering of three one-act Molière comedies. Full-season repertory was available in two Canadian cities, at the Crest theatre, Toronto, and the Canadian Repertory theatre, Ottawa. The well-established Canadian little theatre movement and many university drama groups kept Canada's bilingual amateur theatre moving at a lively pitch throughout the year. Chil-

dren's theatre operated with notable success in Ottawa, London, Winnipeg, Regina, Edmonton and Vancouver. Short-term summer stock companies were more numerous in 1955 than ever before, playing in barns, small theatres and outdoor settings for the entertainment of tourists. Among the most successful were the Peterborough Summer theatre (*When We Are Married*), Niagara Barn theatre (*Private Lives*), Vine-land Garden centre (*The Moon Is Blue*), Montreal Mountain playhouse (*Harvey*) and Kingsmere Summer festival (*Come Back, Little Sheba*). The seventh annual Earle Grey players Shakespearean festival, performed outdoors in the quadrangle of Trinity college, Toronto, was an outstanding success. The autumn Canadian visit (pre-Broadway) to Montreal, Ottawa, Toronto and Quebec of the famous Comédie Française troupe, with a Molière repertory, was memorable for theatre followers in those areas.

(WR. B. H.)

Great Britain.—The year 1955 might be joined in memory to those many years in which the British theatre was more distinguished by fine acting and production than by any upsurge of new creative talent. Menaced by the new cinema of size and colour and by the attractions of competing television undertakings, the theatre held its ground but did not show itself to be adventurous. Few of the better-known dramatists produced a fine new work. J. B. Priestley contented himself with a thin comedy, *Mr. Kettle and Mrs. Moon*, and Dennis Cannan, with *Misery Me*, offered a knockabout intellectual farce which failed to catch on in the theatre, though paradoxically succeeded well enough on television. Christopher Fry, Peter Ustinov, T. S. Eliot, John Whiting and Charles Morgan remained silent, and Terence Rattigan's *Separate Tables* for many weeks almost alone upheld the honour of serious modern theatre in the capital. In these twin plays Eric Portman's two studies in failure which redeems itself continued to give lustre to a playhouse, the St. James's, which was under threat of demolition: a comment on the times.

There were many imports from France, of which Jean Anouilh's *The Lark* was the best, though it had to meet the direct competition of Shaw's masterpiece on the subject of Joan of Arc. Dorothy Tutin played the saint at the same time Shaw's St. Joan was being played by the Irish actress Siobhan McKenna. Of lighter French pieces, André Husson's *My Three Angels* did well, but André Roussin's *Nina* and Marcel Aymé's *The Count of Clérambard* were, respectively, ill cast and misconceived and did not wear well. Jean Giraudoux's Trojan War morality now called *Tiger at the Gates* and his *Ondine* were revived with success, the former going to New York. Alexandre Dumas's outmoded *La Dame aux camélias* excited much public interest for a surprisingly light but finely judged central study. A French revue called *La Plume de ma tante*, with the clown Robert Dhéry, came directly from Paris; and the exotic was

COURTROOM SCENE from 1955 play *Inherit the Wind*, a dramatization of the Scopes trial of 1925, starring Ed Begley (left) and Paul Muni in roles based on William Jennings Bryan and Clarence Darrow

much in evidence. The Azuma Kabuki musicians and dancers from Tokyo were rather lost in the Royal Opera house, but the Chinese classical theatre or opera from Peking was a three weeks' wonder at the Palace. Dance ensembles and operas from elsewhere were applauded.

United States musicals, some with British casts, such as *Wonderful Town* and *The Pajama Game*, were popular. The home-made article, such as *The Water Gypsies* by Sir Alan Herbert and Vivian Ellis, was more grudgingly received but found its own public eventually. Sandy Wilson in *The Buccaneer* did not repeat the success of *The Boy Friend*. An unknown actress, Peggy Mount, achieved overnight stardom in *Sailor Beware*, a lusty farce of middle-class family life by Philip King. Philip Mackie offered an ingenious detective play in *The Whole Truth*, though in this field Agatha Christie continued to queen it with *The Spider's Web* and the endless *The Mousetrap*.

The humorous journal *Punch* sponsored its own revue, which was unremarkable and not characteristic except for a political pungency.

The Italian Ugo Betti's *Burnt Flower-Bed* (posthumous), *The Queen and the Rebels* and *Summertime*, all translated by Henry Reed, were generally well thought of, and Irene Worth as the heroine of the first of these plays gave what some critics rated the performance of the year. She had earlier shown a great development of power in the play commissioned for open stage by the Edinburgh festival from Thornton Wilder, *A Life in the Sun*, a variant of some Alcestis legends which hardly received its critical due, the experimental staging seeming to detract from its impact as a tract. The high thinking was called homespun.

William Douglas Home in *The Reluctant Debutante* struck a vein of mild social comedy likely to appeal to a group (girls and parents about to be "presented at court") which make theatre-

going a rite, as attendance at the opera once was. The play was saved from feebleness by neat acting from Celia Johnson, Anna Massey and Wilfred Hyde White and enjoyed a long run; whereas Fritz Hochwalder's earnest story of spiritual crisis in a Jesuit monastery, *The Strong Are Lonely*, with Donald Wolfitt in the leading part, was coaxed into London only grudgingly. This was a pointer to the decrease in theatrical participation of the more intelligent members of the community.

Graham Greene, whose play from the book *The Power and the Glory* was among the autumn season choices of a Peter Brook-Paul Scofield company, maintained a foot in the worlds of the novel and the drama. It was this company which took to Moscow a production of *Hamlet* which had been asked for by the Soviet cultural authorities during the warm spell prevailing after the Geneva conference of the heads of the Big Four Powers. The expedition was the first for many years to the Soviet Union. The Stratford-on-Avon company toured Europe in 1955 with a *King Lear* (in oddly matching Japanese dress) and *Much Ado About Nothing* in which Sir John Gielgud and Peggy Ashcroft gave magnificent performances. On its home ground, Stratford was fortunate in having the resident company headed by Sir Laurence Olivier, who, in Peter Brook's production of the gory *Titus Andronicus*, and to some extent also in *Macbeth*, gave performances of great originality, imagination and striking power. As Malvolio in *Twelfth Night*, with his wife, Vivien Leigh, as Viola, his playing was more open to discussion. At the Old Vic the standard of Shakespearean playing had not risen. John Neville emerged as a well-graced romantic actor and was named as a possible successor to Gielgud. Paul Rogers was an unusually good Falstaff in the two parts of Henry IV in a production by Douglas Seale which was a model of simple and effective interpretation of the "histories."

At least one top-line actor and playwright, Emlyn Williams, found solo recitations of short stories and poems by his countryman Dylan Thomas more rewarding than any play.

Theorell, Axel Hugo Teodor (1903—), Swedish biochemist, was born at Linköping, Swed., July 6. He was awarded the 1955 Nobel prize for medicine for his discoveries concerning the nature and mode of action of oxidation enzymes. After taking his M.D. degree at Stockholm in 1930 he commenced general practice but an attack of poliomyelitis left him crippled and he decided to devote himself to a life of research. He worked at Uppsala university, 1932–36, and also studied in Germany while holding a Rockefeller fellowship.

In 1934 Theorell produced for the first time in pure form the yellow enzyme which influences combustion in living cells. He later divided the enzyme into two parts, the coenzyme and the apoenzyme, and worked out the chemical chain reaction by which enzymes enable living cells to burn oxygen; that is, to breathe. Theorell also did much work on lipoids in blood and on cytochrome C and was the first to produce pure myoglobin, the red colouring substance of muscle. He devised the method of blood examination which is widely used in Sweden as a test for drunkenness and also discovered an antibiotic called proaptin. These discoveries were, however, overshadowed by his work on enzyme chemistry. Theorell was appointed director of the biochemical department of the Nobel institute at Stockholm in 1937 and became a member of the Swedish Society for Medical Research and the Swedish Academy of Science in 1942.

Thomas, Charles S. (1897—), U.S. secretary of the navy, was born on Sept. 28 at Inde-

pendence, Mo. He studied at the University of California and at Cornell university, Ithaca, N.Y., from 1916 to 1918 but did not receive a degree. He later moved to Los Angeles, Calif., becoming a successful business executive there. Appointed under-secretary of the navy by Pres. Dwight D. Eisenhower, he was confirmed by the senate on Feb. 6, 1953, and served until August, when he took office as assistant secretary of defense for supply and logistics. In this position he assumed charge of the U.S. program of stock-piling essential defense materials. On March 11, 1954, Thomas was nominated secretary of the navy.

In a speech at Chicago, Ill., on Sept. 23, 1954, Thomas predicted that the United States would be victorious over the U.S.S.R. in a submarine war, despite Soviet possession of what was thought to be the world's largest submarine fleet. On April 5, 1955, he declared that the U.S. navy would be able to meet "any initial onslaught" in another global war, then expand rapidly to take the offensive.

Tibet. This is a country of central Asia, north and northeast of the Himalayas, having autonomous status within the People's Republic of China. Area: 469,413 sq.mi. Pop. (1953 census): 1,273,969. Language: Tibetan. Religion: lamaistic Buddhism. Capital, Lhasa, pop. about 20,000. Ruler, the Ling Erh ("divine child") Pamo Tontrup or Lamu Fankha, the 14th dalai lama.

History.—The opening in Nov. 1954 of two highways connecting Lhasa with China proper, one via Lanchow-Sining and another via Chengtu-Yaan, did more than anything else to strengthen Chinese rule in Tibet. Supplies for the Chinese forces of occupation were assured.

The 20-year-old dalai lama, who, with the 18-year-old pan-chen lama, "on the instruction of the chairman Mao Tse-tung," had been studying for the last six months the future regime of his country, left Peking on March 13, 1955, and arrived at Lhasa on June 29. On March 12 it was announced in Peking that the dalai lama would head a special committee of 51 members to prepare Tibet for regional autonomy within the Chinese People's Republic; 15 of these would be from Tibetan local government organizations, 11 from the major monasteries and other religious bodies. The military and administrative commission for Tibet, set up in Sept. 1951, was abolished.

The Chinese government decided to build a hydroelectric

LHASA CHILDREN enjoying a ride on a truck during the ceremonies celebrating the completion of a new highway from Yaan, China, to Tibet in Dec. 1954

power station at Lhasa and a smaller power station at Shigatse. The Sining-Lhasa highway was being extended to Shigatse.

Thubten Jigme Norbu, 34-year-old brother of the dalai lama, arrived in New York city on Oct. 4 to seek U.S. citizenship.

Tin. World production of the tin mines declined slightly in 1954 from 1953, as shown in Table I, reported by the U.S. bureau of mines. Information on smelter output in 1954 is given in the article on MINERAL AND METAL PRODUCTION AND PRICES. World mine production of tin, based on the first seven months of 1955, excluding China and U.S.S.R., was equivalent

Tito (JOSIP BROZ) (1892–), Yugoslav statesman and soldier, was born at Kumrovec, Croatia, May 25, the son of a blacksmith. He served as a private in the Austro-Hungarian army in World War I and was captured in March 1915 by the Russians. In 1920 he returned to Yugoslavia, and was one of the organizers of the Yugoslav Communist party. He was arrested many times, and was sentenced in 1928 to six years' imprisonment for conspiracy. On his release in 1934 he went to Moscow. In 1936, while in Paris, he helped to organize the transport to Spain of volunteers for the international brigades. In 1937 he became secretary-general of the Yugoslav Communist party. After the German attack on the U.S.S.R. he started guerrilla warfare in Yugoslavia. In the first months of 1945 all Yugoslavia was liberated and on March 7, 1945, Tito, who meanwhile had appointed himself marshal, became prime minister and commander in chief.

"FOOTSIES," a 1955 cartoon by Pratt of the McClatchy newspapers

On Jan. 14, 1953, the national assembly elected Tito president of the Yugoslav federation, chairman of the federal executive council and supreme commander of the armed forces.

Tito visited Moscow in April 1945. He paid state visits in 1946 to Warsaw and Prague, and in 1947 to Sofia, Budapest and Bucharest, signing on each occasion a bilateral treaty of friendship and mutual aid. On June 28, 1948, the Cominform published a statement denouncing Tito for his "hateful policy in relation to the U.S.S.R." But Tito's real heresy was his brand of Yugoslav patriotism. In June 1950 he proclaimed that Yugoslavia was the only neutral country in the contemporary world. He pursued, however, his qualified approach to the west. On Nov. 14, 1951, the United States agreed to make available to Yugoslavia military equipment, materials and other services. In Feb. 1953 a Graeco-Turco-Yugoslav treaty of friendship and co-operation was signed, which in 1954 was transformed into a military alliance. In March 1953, at the invitation of the British government, Tito visited Great Britain. During 1954 he paid official visits to Turkey, Greece and India, and in 1955 to Burma, Ethiopia and Egypt.

In a speech on July 28, 1955, at Karlovac (Croatia), referring to the recent visit of N. A. Bulganin and N. S. Khrushchev to Yugoslavia, Tito said that the Soviet leaders could see that Yugoslavia had not betrayed the ideals of Karl Marx. "We are Communists," he went on, "but we do not wish to belong to any camp." On Aug. 5, talking to a group of U.S. visitors, Tito commented that in the new situation the Balkan alliance "should acquire more the character of peaceful collaboration in the economic, political and cultural spheres."

Tobacco. U.S. tobacco consumption in 1955 recovered slightly from the reverses of 1954 to an estimated 12.3 lb. per person 15 years of age and older but was still 4½% below the high levels of 1953 and 1952. Manufacturers and merchants of tobacco in July held a full three-year supply of 4,402,000,000 lb., of which 882,000,000 lb. was owned by the Commodity Credit corporation. Leaf tobacco exports in 1954-55 were valued at \$305,139,000 as compared with \$300,333,000 in

the preceding year. Exports in the first quarter of 1955-56 (July through Sept. 1955) of 175,000,000 lb. were three-fourths larger than a year earlier. Supplementary imports, mostly of the Turkish and cigar types for blending, were valued at \$79,-295,000 in 1954-55 as compared with \$75,344,000 in 1953-54.

About 38,000,000 Americans, including 13,000,000 women, continued as regular smokers of cigarettes. Cigarette production was 415,000,000,000, or 3% more than in 1954 but well below the record level of 435,500,000,000 in 1952; of the total, about 383,000,000 were used domestically. The five-cent cigar was reported as having survived and to be gaining in favour.

The indicated U.S. 1955 crop of all tobaccos was 2,308,028,000 lb., as compared with 2,236,408,000 lb. in 1954 and an average for 1944-53 of 2,098,738,000 lb. Acreage, long under strict official control, was further reduced in 1955 for most types. The 1,520,000 ac. harvested was almost 8% less than the 1,666,000 ac. of 1954 and even more reduced by comparison with the 1,734,000-ac. average for the previous decade. The indicated yield of 1,498 lb. per acre was a new record; 1954 was 1,342 lb. and 1944-53 averaged 1,213 lb. per acre.

Table I.—U.S. Tobacco Production by Leading States

State	(In thousands of pounds) Indicated 1955	1954	Average 1944-53
North Carolina	1,024,365	913,874	855,264
Kentucky	394,885	502,972	442,376
South Carolina	195,800	148,050	154,874
Virginia	177,564	166,458	158,699
Georgia	146,740	124,220	114,536
Tennessee	128,297	148,118	143,556
Pennsylvania	40,815	43,416	49,472
Florida	34,528	32,941	24,748
Maryland	35,700	42,500	37,919
Ohio	24,500	28,840	25,315
Wisconsin	20,522	22,680	30,178
Connecticut	21,248	22,674	25,446
Indiana	12,540	16,137	13,470
Massachusetts	10,965	11,629	11,114

Table II.—Tobacco Production of the Principal Producing Countries

Country	1955-56	1954-55	Average 1947-51	Average 1935-39
United States	2,308,028	2,236,408	2,082,727	1,460,054
China	1,425,000	1,340,000	1,425,000	1,254,539
India	555,500	573,440	547,150	761,600
Brazil	296,018	233,120	202,703
Japan	294,222	248,366	208,092	148,680
Turkey	236,995	215,367	194,109	128,505
Pakistan	200,627	156,511	324,056
Greece	175,000	148,750	113,320	132,320
Canada	141,900	184,156	129,445	76,556
Italy	116,844	124,626	167,900	90,500
Southern Rhodesia	120,250	84,679	26,150
Indonesia	115,000	62,230	222,372
France	105,291	126,460	109,070	72,995

The flue-cured crop, basic to cigarette and export supplies, was the largest in history, 1,514,043,000 lb. Much of the crop sold at an average of 51.7 cents per pound as compared with 52.3 cents in 1954 and a support level of 48.3 cents per pound. The total supply, including carry-over, was at least 3,573,000,000 lb. against a probable usage of about 1,200,000,000 lb. including exports. Growers in July overwhelmingly approved marketing quotas for the 1956, 1957 and 1958 crops, including a 12% acreage reduction and a proposed marketing quota of 1,130,000,000 lb. for the 1956 crop, as compared with 1,270,000,000 lb. for the 1955 crop.

The air-cured burley crop was a light one of 519,915,000 lb. The 1955 crop plus large carry-over provided a total supply of about 1,835,000,000 lb., as compared with usage not likely to greatly exceed 530,000,000 lb. The price support was 46.2 cents per pound. Southern Maryland tobacco (type 32), without government price support since 1953, was indicated at 35,700,000 lb. Carry-over plus the new crop totalled about 107,000,000 lb. as compared with total disappearance, including 8,000,000 lb. exported, during the previous year of 37,500,000 lb. The average price received for the 1954 crop (sold in mid-1955) declined to 39.5 cents per pound as compared with 54.5 cents per

pound for the previous crop.

Fire-cured types (class 2) were indicated at 64,831,000 lb. Carry-over plus stocks provided a total supply of 199,500,000 lb., as compared with total usage in the previous year of 60,000,000 lb. It appeared that the price would be near the official support of 34.6 cents per pound.

Production of dark air-cured types was indicated at 34,410,000 lb., approximately the same as in 1954. Total supplies of 112,000,000 lb. were more than three times the probable usage of about 32,000,000 lb., and prices were expected to approximate the support level of 30.8 cents per pound. All cigar types, some of which were grown without price supports, totalled 108,660,000 lb. as compared with 115,289,000 lb. in 1954.

The tobacco harvest of the principal producing countries of the northern hemisphere in 1955 was estimated at 5,830,000,000 lb., about 2.2% more than in 1954. In spite of extensive control over tobacco plantings in several of the producing countries, about 5,452,000 ac. were devoted to the crop, as compared with 5,436,000 ac. in 1954 and only 4,593,000 ac. prewar. World trade in tobacco expanded, particularly in the second half of 1955 to Europe, to a level probably in excess of the 600,000 metric tons of recent years.

(J. K. R.)

Tobago: see TRINIDAD AND TOBAGO.

Togoland: see BRITISH WEST AFRICA; FRENCH WEST AFRICA; TRUST TERRITORIES.

Tonga. (FRIENDLY ISLANDS). Tonga is a kingdom under British protection, exercised through the governor of Fiji and a local British agent. There are three main island groups, Vava'u, Ha'apai and Tongatapu. Total area: 270 sq.mi. (Tongatapu Island 99.2 sq.mi.). Pop. (Dec. 1954 est.): 52,000, mainly Tongans, racially and linguistically Polynesian with Melanesian admixture. Religion: Christian. Capital, Nukualofa (pop. 1950 est., 5,500), on Tongatapu. Queen, Salote Tupou; premier in 1955, Crown Prince Tungi; British agent and consul, C. R. H. Nott.

History.—The premier of Tonga, Prince Tungi, visited the United Kingdom and the Netherlands on official business in April 1955, calling upon Queen Elizabeth II in London and returning home via Canada and the U.S.

(J. J. Ty.)

Tornadoes: see DISASTERS; METEOROLOGY.

Toronto. Capital of the province of Ontario, Can., Toronto is situated on the north shore of Lake Ontario, almost opposite the mouth of the Niagara river, 60 mi. N. of Buffalo. Pop. (est. 1954): city proper 675,754. Mayor of the city of Toronto in 1955: Nathan Phillips.

As of Dec. 31, 1954, the city's outstanding gross debenture debt issued by the city was \$132,187,987, of which \$98,565,536 remained outstanding with respect to debentures originally assumed by the metropolitan government. Debentures issued by the metropolitan government on behalf of the city: \$22,625,126. The debenture debt outstanding, Dec. 31, 1954, for which the city is liable: \$56,247,577. The city's estimated expenditures for 1955: \$83,910,160. Estimated revenues for 1955 (other than taxation and including surplus brought forward from 1954): \$16,764,337. Estimated taxation revenues for 1955: \$67,145,823. Total taxable assessment for 1955: \$1,543,974,668.

On June 13, 1955, the board of control set a tax rate of 44.75 mills for Toronto public schools, 1.25 mills higher than in 1954. The employment index (based on 1949=100) was: 1954 monthly average, 120.1; July 1, 1955, 121.6. The aggregate pay-rolls index, same base, was: 1954 monthly average, 168.9; July 1955, 178.3. The average weekly earnings in wages and salaries

were: 1954, \$62,23; July 1, 1955, \$64.85. The total value of buildings constructed in 1954 was \$86,584,144; up to Sept. 30, 1955, \$43,290,072. The total foreign cargo imports and exports passing through the port of Toronto in 1954: 122,319 tons; up to the end of Aug. 1955, 63,910 tons. Total over-all exports and imports (domestic and foreign combined): 1954, 4,784,937 tons; up to the end of Aug. 1955, 2,686,535 tons.

Covering an area of 240 sq.mi., the municipality of metropolitan Toronto consists of a federation of the city of Toronto and 12 suburban municipalities, administered by a council composed of 25 members—a chairman, five mayors, eight reeves, two controllers and nine aldermen, representing the member municipalities. The metropolitan estimates for 1955 anticipated a gross expenditure for current purposes of \$62,528,455, of which it was estimated \$26,493,899 would be met by provincial government grants, water charges and sundry other revenues, and \$36,034,556 met by a tax-rate levy of 13.7 mills against the area municipalities. Of the total gross expenditures the larger items were \$33,924,773 for education, \$5,787,753 for water-works, \$7,393,439 for welfare and housing and \$4,088,000 for roads.

Retail sales within the metropolitan area stood at \$1,481,245,000 in 1953, a total representing 12.1% of the total Canadian market, according to an estimate of the magazine *Sales Management*.

(K. A. K.)

Tourist Travel. Vacationists were out in full force in the United States during 1955, spending more time on the road and taking more trips. It was estimated that at least 80,000,000 persons made at least one journey and that their combined expenditures totalled between \$15,000,000,000 and \$20,000,000,000.

The number of vacationists travelling at home rose about 5% and those going abroad about 15%. About 85% of all trips were made by private passenger car.

An important development for the motor traveller was the opening in October of the 241-mi. Ohio turnpike. The only remaining links still to be completed in a connecting chain of thruways between New York and Chicago were the Indiana turnpike and a Delaware river bridge between the New Jersey and Pennsylvania turnpikes; those were due to be finished by Nov. 1956.

The national parks showed an increased attendance of 5% during the first nine months of 1955. Visitors to all areas under the jurisdiction of the national park service totalled 37,532,104, and to the 28 principal national parks 14,687,253. The most visited national park was Great Smoky mountain (1,935,757), followed by Rocky mountain (1,215,004), Shenandoah (1,043,675), and Yellowstone (1,176,659). Attendance declines were noted at these national parks: Crater Lake, Hawaii, Hot Springs, Kings Canyon, Shenandoah, Wind Cave, Yosemite and Zion.

Motels continued to spring up all over the country; their total number exceeded 50,000, but the latest establishments incorporated many of the features of a hotel. The Sheraton corporation began the first of a series of "motor lodges" or "highway inns."

Canadians went abroad in record numbers. In the full year 1954 Canadians spent \$80,000,000 more on travel in other countries than foreign visitors spent in Canada. Visitors from the United States spent \$280,700,000 in Canada, while Canadians spent \$313,250,000 in the U.S. Receipts from Europeans and other overseas visitors in Canada amounted to \$22,000,000, while Canadians spent approximately \$69,000,000 in countries other than the United States.

The number of individual entries into Canada from the U.S.

in 1954 was 26,413,000, a decline of nearly 6%, although their expenditures were close to the record. The entries, which include commuter crossings and other repeat visits, do not give a relevant figure on long-stay vacationists, but the Canadian government estimated that approximately 7,000,000 U.S. travellers spent all or part of their vacations in Canada.

Automobile travel from the U.S. to Mexico during 1955 rose appreciably through all four of the principal gateways. Through Laredo, Tex., the most heavily used point of entry, 21,000 visitors crossed into Mexico during July alone—three times more than in the same month of the previous year.

More than 900,000 U.S. travellers went to foreign countries more distant than Canada and Mexico during the complete year 1954. The total expenditure by U.S. visitors in all foreign countries was estimated at \$1,360,000,000, or about \$80,000,000 higher than the preceding year. About 430,000 or nearly half visited the West Indies, but Europe and the Mediterranean ranked close behind with 420,000.

The total to Europe, however, began to rise sharply, probably as a result of the growing popularity of "fly now, pay later plans" being advertised by all the international airlines.

U.S. travellers spent about \$400,000,000 for transportation between the U.S. and other countries during 1954, with foreign flag carriers receiving \$186,000,000.

The passport division of the U.S. department of state issued a record number of passports (452,000 in 1954 and an estimated 500,000 in 1955) and prepared for an even greater demand on its facilities. The passport figures showed that residents of New York city were the leaders in foreign travel. They received 82,855 passports, and were followed by residents of California (33,458), Pennsylvania (28,293), New York state, excluding the city (27,337), New Jersey (26,813) and Illinois (26,114). By occupation, housewives (70,242) led all others, followed by clerks-secretaries (35,114), executives (34,576), skilled labourers (31,567) and students (29,080).

A surprising development on the international travel scene was an expression of interest by the Soviet government in developing its tourist trade. A number of visitors from the U.S. were admitted to the Soviet union, while tour groups were invited from the Scandinavian countries. (See also AMERICAN CITIZENS ABROAD; NATIONAL PARKS AND MONUMENTS.)

(M. L. FE.)

Town and Regional Planning. The greatest factor which influenced planning in European and U.S. cities during 1955 and prior years was the rapid increase in population in urban regions and the congestion which had developed in downtown districts. In England, Canada, Australia and Sweden the emphasis was on the building of new towns. The United States launched redevelopment and renewal programs.

United States.—The population of the United States increased nearly 10% between 1950 and 1955, and the greatest increase was in urban areas. The insistent demand for street space and off-street parking had led to proposed encroachments on parks and parkways in spite of the increasing need for outdoor recreation.

According to the *Municipal Year Book* for 1955, 716 of the 835 reporting cities of more than 10,000 population had official planning agencies, and 215 had full-time planning directors. More than 60,000,000 motor vehicles were registered in the United States in 1955, and the resulting congestion in urban centres was greater than in other parts of the world. Further complicating the use of existing streets and highways was the volume of freight being carried in large motor trucks, in competition with rail and air transport.

In many cities the downtown businessmen had organized to

stimulate the replanning and rebuilding of their downtown districts. The Urban Land Institute led a fight for the rehabilitation of downtown business, and late in 1954 issued a book called *The City Fights Back*. Nearly every city in the country had undertaken an extensive program for well-located, off-street parking, and retail stores and shops co-operated to make parking available without cost for a reasonable time to their patrons.

Most cities in the United States had made studies leading to the revision of zoning ordinances. In addition to cities which set aside industrial areas protected from mixed uses, a growing number adopted laws and regulations to bring to an end the nonconforming uses which existed when the zoning ordinance was first adopted. The increase in the number and size of airports had brought demands for more comprehensive zoning of surrounding areas.

Applications to the Housing and Home Finance agency under the Housing act of 1954 had come from four states, involving assistance to 50 small municipalities, and these had received approval; applications from three states proposing assistance for 38 small communities were being processed. The sum of \$104,045 had been approved for work in four metropolitan or regional areas, and applications for six additional metropolitan areas, requesting \$168,025, were in process. Up to Sept. 1, 1955, workable programs had been approved for 61 cities, 16 were under review and 71 were reported to be in preparation. These planning loans and grants-in-aid under the Housing act of 1954 proved to be a great stimulus to local comprehensive planning.

In Rochester, N.Y., the Citizens Council for a Better Rochester and the Junior Chamber of Commerce proposed the reclamation of the banks of the Genesee river which runs through the city. The improvement would provide space for parking, public buildings and new roadways as well as for recreation areas.

A planning report on *Modernizing Downtown San Francisco*, issued by that city's department of planning in Jan. 1955, analyzed the functions of the downtown area. Its future, it was pointed out, would depend on the ability of the businessmen to capitalize on their advantages and overcome their deficiencies. There was needed a regional rapid transit system tied in with local transit; parking facilities distributed around the downtown areas; systems of downtown streets to handle pedestrian, surface transit and vehicular movement; and completion of the planned freeway distribution system to handle traffic around the downtown area.

A planning report in Buffalo, N.Y., recommended changes in public transit vehicles, especially on the streets in the downtown district; provision of adequate off-street parking around the central business core; and bold changes for the central area to incorporate some of the creative planning ideas which had been developed in suburban plazas. A downtown pedestrian shopping concourse, with ornamental sculpture and fountains, was planned.

Other Countries.—In England the construction and development of new towns had progressed around 140 urban areas at the rate of 306,000 new houses a year.

In New Zealand progress was made under the Town and Country Planning act of 1953, by which cities were required to produce population and economic base analyses before zoning codes were drawn up. Residential districts were protected from billboards. Places of historic interest or scenic beauty had to be registered and plans made to preserve them. Continuous commercial frontages were protected from intrusions, and covered sidewalks and arcades were designated for streets in certain commercial zones.

In Canada the development of the St. Lawrence seaway was stimulating planning of adjacent communities. In Montreal there was a redevelopment program for the dock area. At

Ottawa, the capital, railways were being removed from the centre of the city and rerouted around the rim. Parkways and arterial roads were to replace the rail lines. Under the plan there would be a new city hall, an auditorium, a national institute of fine arts, a civic theatre and new office and governmental buildings. About 4,000 ac. of land along the new railway lines were acquired for industrial development.

Kitimat, B.C., 100 mi. S. of the Alaskan border, said to be the first wholly new town in North America, was designed to serve the Aluminum Company of Canada's power and smelter plant, estimated to cost \$700,000,000. The town site, 6 mi. from the plant, provides modern community facilities. At Don Mills, a new town near Toronto covering 2,200 ac., the emphasis was on neighbourhoods built around elementary schools. Architectural control was maintained over all the buildings.

In Sweden, Vallingby was the first of several new neighbourhood communities to be located in the confines of greater Stockholm on land owned by the city. Air, sunshine, comfortable and pleasant transportation, recreational and educational opportunities and adequate community facilities were declared requisite for the environs of a great world capital. Features of the plan included a "centrum" to serve the whole area and a new and airy "tunnelbana" to provide rapid transit from Kungs Gatan station in the centre of the old town to Vallingby station. Close by the station would be a four-story car park for 700 automobiles and a general repair shop.

Recent street changes in rebuilding European cities included Plymouth's Armada way, laid out for vistas as well as for function, and a ring road to encircle the central city. Frankfurt and Hanover, Ger., had made impressive street improvements. In the reconstruction of Milan and Rouen, underground garages were built. (See also ARCHITECTURE; BUILDING AND CONSTRUCTION INDUSTRY; HOUSING; MUNICIPAL GOVERNMENT; URBAN TRANSPORTATION, U.S.).

Toy Industry. World toy production continued to increase in 1955, with an estimated gain of 18% over 1954 production. In the United States the estimated total sales of toys at retail in 1955 were placed at \$1,250,000,000, the highest in the history of the industry and an increase of approximately 20% over 1954 sales.

Imports of toys into the U.S. showed an increase of 23% for the first eight months of 1955 over the comparable period of 1954. Japan continued to be the principal supplier to the U.S., accounting for 80% of all U.S. toy imports, while Germany was the second largest supplier of toys to the U.S.

On the basis of preliminary figures, Japan displaced the United States as leading exporter of toys to world markets, while the U.S. came second and western Germany was third.

Exports of toys from the U.S. in 1955 were slightly above the 1954 volume of \$13,974,329, with Canada and South America as the two principal markets.

The U.S. continued to lead the world in toy manufacturing facilities with about 2,000 plants employing 60,000 people who received total wages of \$180,000,000. The plants were located in virtually every state of the union, with heavy concentrations in the northeast, middle Atlantic and Pacific coast areas.

During the year the first official market and opinion survey of the American toy industry was completed. Sponsored by the Toy Manufacturers of the U.S.A., Inc., the report dealt with Christmas purchases of toys and covered consumer buying habits, preferences, dollar purchases and market facts. The principal facts revealed by the survey were: that more than \$920,000,000 was spent at Christmas time in 1954 by American families on toys; about 33,000,000 families, or 78% of total U.S. families, bought toys during the Christmas season; the age bracket of 33 to 44 years comprized the largest toy buying group; the average family spent \$28 for Christmas toys; the major market in toys was for children from two to six years old; department stores, variety stores and five-and-ten-cent stores accounted for three-fifths of the toy sales. Supermarkets, discount houses and mail-order houses (having no retail stores) each sold about 2% of the Christmas toys.

Prices of toy products remained in 1955 at about the 1954 level.

The 52nd annual toy fair, sponsored by the Toy Manufacturers of the U.S.A., Inc., was held in New York city in March 1955, and attracted 1,350 manufacturers and more than 14,000 buyers. This annual show features the latest developments in toys.

(H. D. C.)

Track and Field Sports. The approach of another Olympic year (1956) sparked competition in 1955 and resulted in more than the average number of records. Chief interest was focused on the distance stars, and, although they accounted for several new standards, none was able to break the clocking of 3 min. 58 sec. set by John Landy of Australia the year before. For the first time in history three runners in the same race were timed under 4 min. for the mile. On May 28 at London, Eng., Laszlo Tabori of Hungary won in 3 min. 59 sec., defeating Chris Chataway of England and Brian Hewson, another Briton, both of whom were clocked at 3 min. 59.8 sec. Wes Santee, former University of Kansas star and top miler of the United States, continued his quest of the 4-min. time outdoors after a successful campaign on the boards and established a new American record when he was clocked in 4 min. 0.5 sec. in the Texas relays. The time was 0.1 sec. better than his former U.S. mark.

Sandor Iharos, a Hungarian, was among the year's chief record makers, numbering among his many feats new records at 1,500 m., 5,000 m. and at 2 mi. He ran the 1,500 m. in 3 min. 40.8 sec. to beat John Landy's listed mark of 3 min. 41.8 sec. The new mark was tied at Oslo, Nor., when Tabori defeated Gunnar Nielsen of Denmark in a close finish in which both were clocked at 3 min. 40.8 sec. Iharos won at 5,000 m. in 13 min. 50.8 sec. and was clocked in 13 min. 25 sec. for 3 mi. to improve on the universal standards of 13 min. 51.2 sec. and 13 min. 26.4 sec. that had been set by Vladimir Kuts of the U.S.S.R. Kuts later ran the 5,000 m. in 13 min. 46.8 sec. to regain his record at that distance. A crowd of 50,000 at London on May 30 saw Iharos win a two-mile event in 8 min. 33.4 sec.

Jim Golliday of Northwestern university, Evanston, Ill., tied the world clocking of 9.3 sec. for 100 yd. in the western conference relays on May 14. Bob Morrow of Abilene Christian college, Abilene, Tex., ran a sensational 9.1 sec. in the N.A.I.A.

championships at Abilene, Tex., but the record was nullified by a strong helping wind. Arnie Sowell ran the 440 yd. anchor leg in a mile relay for the University of Pittsburgh in 45.4 sec. to better the record of 46 sec. for 440 yd., but split times in relays are not recognized as individual marks. Lou Jones accounted for a new world 400-m. clocking with a 45.4-sec. victory in the Pan-American contests.

One of the oldest world standards, that for 800 m., was broken on Aug. 3 at Oslo, when R. Moens of Belgium won in 1 min. 45.7 sec. The 880-yd. record was tied or bettered a number of times by Sowell, Hewson, Santee and Lon Spurrier, the last-named being caught at 1 min. 47.5 sec. for the fastest of the campaign.

Amateur Athletic Union and College Championships.—The A.A.U. senior national championships in Colorado in June featured the American outdoor campaign and the competition resulted in two new American records as well as three other meet marks. Harold Connolly of the Boston (Mass.) Athletic association established an American and games standard for the hammer throw with a toss of 199 ft. 8 in. The former record of 195 ft. 4½ in. was set by Martin Engel in 1953. Bob Backus achieved new American and meet marks with a heave of 43 ft. 5 in. in the 56-lb. weight event. The best previous throw, also by Backus, was 42 ft. 5½ in. Sowell ran the 880 yards in 1 min. 47.6 sec.; Frank Held of the San Francisco Olympic club hurled the javelin 260 ft. 3 in. and Rod Richard, U.S. army, won the 220-yd. dash in 21 sec. for the other new meet standards. Sowell, one of 1955's stars, was voted the meet's outstanding athlete and received the Charles J. Dieges memorial award. The New York Athletic club captured the team scoring trophy with 111 points, the Los Angeles Athletic club being runner-up with 87½ points.

Richard, Morrow and John Haines, University of Pennsylvania ace, were among the year's leaders in the sprints. Tom Courtney, Fordham university, New York, star, shone in the distance events, both in the United States and abroad. Manhattan college of New York city carried off the Intercollegiate A.A.A.A. team laurels indoors and out and the University of Southern California, Los Angeles, triumphed in the National Collegiate A.A. outdoor games for the 7th consecutive time.

Mal Whitfield, twice Olympic 800-m. champion, became the first Negro to win the James E. Sullivan memorial trophy when he was voted to receive the honour for 1954. The prize is given to "the amateur athlete who, by performance, example and good influence, did most to advance the cause of good sportsmanship during the year."

Mile stars, aided by Nielsen, furnished the big thrills of the American indoor season. The Danish ace made a spectacular debut in the Massachusetts Knights of Columbus meet at Boston, Mass., Jan. 15 when he won the mile in 4 min. 7.9 sec. for a meet record. He led home Fred Dwyer of the armed forces by 5 yd. Six other marks for the games were shattered, including one for the pole vault when Bob Richards leaped 15 ft. 3¼ in. Santee defeated Nielsen in a 4 min. 10.5 sec. race at the Philadelphia (Pa.) *Inquirer* contests Jan. 21. Rod Perry of Pennsylvania State university, State College, Pa., tied the world indoor standard of 6 sec. as he defeated Harrison Dillard in the hurdles. Richards reached 15 ft. 5 in. in vaulting over the 15-ft. level for the 59th time. Nielsen surprised Santee in the Washington (D.C.) *Evening Star* games of Jan. 22, winning in 4 min. 10.5 sec. Art Bragg won the sprints, tying a meet mark of 7.1 sec. at 70 yd. and establishing an indoor time of 9.7 sec. for 100 yd.

In the Boston Athletic association meet Jan. 29, Santee set a new world indoor time of 4 min. 3.8 sec. as he led home Nielsen by 25 yd. Dillard maintained his reputation of never losing

a hurdles race in Boston when he won the 45-yd. high event in 5.6 sec. Nielsen improved on Santee's young world mark on Feb. 5 when he took the mile in the Millrose games in New York's Madison Square Garden in 4 min. 3.6 sec. A collision between Santee and Dwyer resulted in disqualification for Dwyer. On the way, Santee broke Glenn Cunningham's 17-year-old standard for 1,500 metres when he was clocked in 3 min. 48.3 sec. Dwyer beat both Nielsen and Santee in setting a New York Athletic club meet mark of 4 min. 6.2 sec. on Feb. 12. Norway's Audun Boysen easily won at 1,000 yd. in 2 min. 10.2 sec., a record for the games.

A crowd of 13,000 saw one world record established and two others tied in the A.A.U. championships at Madison Square Garden on Feb. 19. Parry O'Brien of the Los Angeles Athletic club and the armed forces put the 16-lb. shot 59 ft. 5½ in. to better his own universal indoor standard by 1½ in. Haines tied the world. American indoor and meet mark of 6.1 sec. in winning the 60-yd. dash. Sowell won the 1,000-yd. in 2 min. 8.2 sec. to tie the world standard. He was selected as the meet's outstanding performer. Manhattan college took the team crown in the Intercollegiate 4-A championships of Feb. 26 although it had only one individual champion, Charley Pratt in the hurdles. Santee, with Nielsen and Dwyer missing, breezed to a 4 min. 10.4 sec. mile triumph in the New York Knights of Columbus contests March 5. Richards set a Madison Square Garden mark when he vaulted 15 ft. 4½ in. Tom Courtney ran a 1 min. 52.6 sec. half mile, fastest in history on a flat board track, in the New York Pioneer-369th A. A. games in New York on March 12. Richards and Santee shone in the Milwaukee *Journal* meet at Milwaukee, Wis., on March 12. Richards again cleared 15 ft. in the vault and Santee won the mile in 4 min. 8.3 sec.

Hall of Fame.—Three coaches were among the many personalities in the sport added to the Helms Hall Track and Field Hall of Fame in 1955. Mentors honoured were Robert Allison Fetzer, coach at the University of North Carolina for 34 years; William Hayward, coach at the University of Oregon during 44 campaigns, and Earle (Billy) Hayes, whose career ended with a 19-year tenure at Indiana university. Harold Davis, former University of California sprinter; Louis Gregory, distance star of the Millrose Athletic association; and Harrison Dillard, who won the 1948 Olympics high hurdles and 100-m. dash at the 1952 games, were selected. Others named were Horace Ashenfelter, distance star; John Borican, middle distance man; James Donahue, all-around athlete; G. W. Orton, 1900 Olympic steeplechase victor and founder of the Penn relays; Eulace Peacock, stellar sprinter, broad jumper and Pentathlon athlete; J. Gregory Rice, distance runner, and Bob Richards, pole vaulter. Three walking stars, Harry Hinkel, Henry Laskau and William Mihalo, were the first of their specialty selected. Women athletes chosen during 1955 were Mrs. Frances Kaszubski, chairman of the women's A.A.U. track and field committee; Alice Coachman; Lillian Copeland; Mildred (Babe) Didrikson Zaharias; Dorothy Dodson; Helen Stephens and Stella Walsh.

Pan-American Games.—The second Pan-American meet,

Table I.—Major World Records Improved in 1955

Event	Name and nationality	Place	Date	Performance	Approved record
400 m.	L. Jones (U.S.)	Mexico City, Mex.	March 18	45.4 sec.	0:45.8
	J. Lea (U.S.)	Mexico City	March 18	45.6 sec.	0:45.8
800 m.	R. Moens (Belg.)	Oslo, Nor.	Aug. 3	1 min. 45.7 sec.	1:46.6
	A. Boysen (Nor.)	Oslo	Aug. 3	1 min. 45.9 sec.	1:46.6
880 yd.	L. Spurrier (U.S.)	Berkeley, Calif.	March 26	1 min. 47.5 sec.	1:48.6
	A. Sowell (U.S.)	Boulder, Colo.	June 25	1 min. 47.6 sec.	1:48.6
	W. Santee (U.S.)	Modesto, Calif.	May 21	1 min. 48.5 sec.	1:48.6
1,000 m.	A. Boysen (Nor.)	Gothenburg, Swed.	Aug. 30	2 min. 19 sec.	2:19.5
	I. Rozsavolgyi (Hung.)	Budapest, Hung.	Sept. 21	2 min. 19 sec.	2:19.5
1,500 m.	S. Iharos (Hung.)	Helsinki, Fin.	July 28	3 min. 40.8 sec.	3:41.8
	L. Tabori (Hung.)	Oslo	Sept. 6	3 min. 40.8 sec.	3:41.8
	G. Nielsen (Den.)	Oslo	Sept. 6	3 min. 40.8 sec.	3:41.8
2,000 m.	I. Rozsavolgyi (Hung.)	Budapest	Oct. 2	5 min. 2.2 sec.	5:07
5,000 m.	S. Iharos (Hung.)	Vienna, Aus.	Sept. 10	13 min. 50.8 sec.	13:51.2
	V. Kuts (U.S.S.R.)	Belgrade, Yugos.	Sept. 18	13 min. 46.8 sec.	13:51.2
2 mi.	S. Iharos (Hung.)	London, Eng.	May 30	8 min. 33.4 sec.	8:40.4
3 mi.	C. Chataway (Eng.)	London	July 30	13 min. 23.2 sec.	13:26.4
	S. Iharos (Hung.)	Vienna	Sept. 10	13 min. 25 sec.	13:26.4
440-yd. relay	Texas U. (U.S.)	Modesto	May 21	41.2 sec.	0:40.5
3,200-m. relay	U.S.S.R.	Riga, Latvia	Aug. 1	7 min. 26.4 sec.	7:26.8
6,000-m. relay	Hungary	Budapest	Sept. 29	15 min. 14.8 sec.	15:21.2
3,000-m. steeplechase	P. Karvonen (Fin.)	Oslo	July 15	8 min. 45.4 sec.	8:49.6
	J. Chromik (Pol.)	Budapest	Sept. 11	8 min. 40.2 sec.	8:49.6
Hammer throw	M. Krivonozov (U.S.S.R.)	Belgrade	Sept. 19	211 ft. 8¼ in.	200 ft. 11 in.
Javelin throw	F. Held (U.S.)	Modesto	May 21	268 ft. 2½ in.	263 ft. 10 in.
Hop, step and jump	A. F. da Silva (Brazil)	Mexico City	March 16	54 ft. 4 in.	53 ft. 2¾ in.
Women's 800 m.	N. Ortolenko (U.S.S.R.)	Belgrade	Sept. 24	2 min. 5 sec.	2:06.6
Women's 80-m. hurdles	G. Ermolenko (U.S.S.R.)	Leningrad, U.S.S.R.	July 6	10.8 sec.	0:10.9
Women's 400 m.	M. Itkina (U.S.S.R.)	Bucharest, Rum.	Oct. 1	53.9 sec.	0:54.4

held at Mexico City March 12-26, 1955, attracted 2,000 athletes from 22 nations. A crowd of 100,000 saw the parade of stars after Pres. Don Adolfo Ruiz Cortines of Mexico officially started the games. The track and field competition was featured by two world record-breaking feats while numerous meet marks were established. Leading a host of United States victors was Lou Jones who captured the 400-m. dash in 45.4 sec. for a new universal standard. The other world record was established by Brazil's 1952 Olympic champion, Adhemar Ferreira da Silva, who covered 54 ft. 4 in. in the hop, step and jump. Double gold medal winners were Rodney Richard of the United States, who was first at 100-m. and 200-m. events, and Oswaldo Suarez of Argentina, who won the 5,000-m. and 10,000-m. events. The 1959 Pan-American games were awarded to Cleveland, O.

A list of the champions in the 1955 meet is given in Table III.

Table II.—National A.A.U. Men's Championships

(Indoors, at New York, Feb. 19, 1955)

60 yd.—John Haines, U. of Pennsylvania (6.1 sec.; tied world, American indoor and championship record)
 60-yd. high hurdles—Harrison Dillard, unattached, Cleveland, O. (7.3)
 600 yd.—Charles Jenkins, Villanova U. (1 min. 11.9 sec.)
 1,000 yd.—Arnold Sowell, U. of Pittsburgh (2:08.2, tied world, American indoor and championship record)
 One mile—Wes Santee, unattached, Lawrence, Kan. (4:07.9, new championship record)
 Three mile—Horace Ashenfelter, New York A.C. (13:54.0)
 One-mile walk—Henry Laskau, 92d St. Y.M.H.A., N.Y. (6:30.4)
 One-mile sprint medley relay—New York Pioneer club, team A (Frank Bowens, James Ryan, James Gathers, Andy Stanfield), (1:53.8)
 One-mile relay—Morgan State college (Herman Wade, Rudy Solomon, James Rogers, Josh Culbreath), (3:18.5)
 Two-mile relay—Syracuse U. (Bob Milner, Les Vielbig, Steve Armstrong, Don Shupe), (7:39.7)
 35-lb. weight throw—Robert Backus, New York A.C. (60 ft. 4½ in.)
 Running broad jump—Pvt. R. Range, armed forces (25 ft. 1 in.)
 16-lb. shot-put—Parry O'Brien, Los Angeles A.C. (59 ft. 5½ in.; new world, American indoor and championship record)
 Pole vault—Bob Richards (15 ft. 4 in., new championship record)
 Running high jump—Lt. John Hall, armed forces, and Ernie Shelton, unattached, Los Angeles, Calif. tied (6 ft. 8¾ in.)
 Leading team scores—New York Pioneer club 24; New York A.C. 15; Los Angeles A.C. 13
 (Outdoors, at Boulder, Colo., June 24-25, 1955)
 100 yd.—Bobby Morrow, Abilene Christian (9.5 sec.)
 220 yd.—Rod Richard, army (21; meet record; former mark 21.1)
 440 yd.—Charles Jenkins, Villanova (46.7)
 880 yd.—Arnold Sowell, Pittsburgh (1 min. 47.6 sec. meet record; old mark 1:50.8)
 One mile—Wes Santee, Marine corps (4:11.5)
 Three mile—Horace Ashenfelter, New York A.C. (14:45.2)
 Six mile—Dick Hart, Collegiate Track & Field Club, Philadelphia, Pa. (31:58.5)
 Two-mile walk—Henry Laskau, 92d St. Y.M.H.A. (15:09.4)
 Two-mile steeplechase—Ken Reiser, Eugene Town club (10:20.7)
 120-yd. high hurdles—Milt Campbell, Indiana (13.9)
 220-yd. low hurdles—Charles Pratt, New York Pioneer club (23.5)
 440-yd. low hurdles—Josh Culbreath, Morgan State college (52, tied meet record)
 Hop, step and jump—Victor Paredez, Cuban National Physical Education club (50 ft. 4 in.)
 Broad Jump—Gregory Bell, unattached, Terre Haute, Ind. (26 ft. ½ in.)
 High jump—Ernie Shelton, Los Angeles A.C. and Charles Dumas, Centennial high school (Compton, Calif.) tied (6 ft. 10 in.)
 Pole vault—Bob Richards, Los Angeles A.C. (15 ft.)
 Shot-put—Parry O'Brien, air force (58 ft. 5¾ in.)
 Discus—Parry O'Brien (175 ft. 7 in.)
 Javelin—Franklin Held, San Francisco Olympic club (260 ft. 3 in.; meet record; former mark 252 ft. 11½ in.)
 56-lb. weight—Bob Backus, New York A.C. (43 ft. 5 in.; meet record; former mark, 42 ft. 5¼ in.; American record; former mark, 42 ft. 5¼ in.)
 Hammer throw—Harold Connolly, Boston A.A. (199 ft. 8 in.; meet record; former mark 189 ft. 3 in.; American record; former mark 195 ft. 4½ in.)
 Leading team scores—New York A.C., 111; Los Angeles A.C., 87¾; New York Pioneer club, 54

Above: Laszlo Tabori, Hungary, breaking the tape at the finish of the International Invitation mile race of the British games at White City stadium, London, May 28. Tabori, Chris Chataway (centre) and Brian Hewson were all timed at less than 4 min.

Above, right: Final heat of the 120 yd. high hurdles, Intercollegiate A.A.A.A. meet, New York city, May 28. The event was won by Joel Shankle, Duke university, shown farthest from the camera

Right: Lou Jones (right), U.S., setting a world record of 45.4 sec. in the 400-metre race of the Pan-American games at Mexico City, Mex., March 18. Following close behind were teammates Jim Lea (centre), second, and Jesse Mashburn, third

TRACK AND FIELD, 1955

Below: Parry O'Brien warming up for a 59 ft. 5½ in. throw of the shot-put Feb. 19, breaking his own world indoor record

Below: Hans Visser, Netherlands, leaping 24 ft. in the broad jump during an international meet at Rotterdam, Aug. 11

Below: The Rev. Bob Richards, U.S., clearing the bar at 14 ft. 9¾ in. to win the pole vault event at the Pan-American games

National A.A.U. Women's Championships

Indoors, at Chicago, Feb. 5, 1955

60 m.—Isabel Daniels, Tennessee A. & I. university (7.9 sec.)
 100 m.—Barbara Jones, Chicago Comets (12.3)
 220 yd.—Alfrances Lyman, Chicago Comets (26.2)
 800-m. hurdles—Nancy Phillips, German-American A.C., Brooklyn, N.Y., (12.0)
 440-yd. relay—Chicago Comets (Watkins, Lyman, Landry, Jones), (50.5, new meet record)
 Basketball throw—Amelia Wershoven, Equitable Life Assurance society, N.Y. (98 ft. 2 in.)
 4 kilo shot-put—Lois Testa, Red Diamond A.C., Boston, Mass. (37 ft. 6½ in.)
 Standing broad jump—Shirley Hereford, Holland Recreation club, Cleveland, O. (8 ft. 1½ in., meet record)
 Running high jump—Mildred McDaniel, Tuskegee institute (5 ft. 2 in.)
 Discus throw—Marjorie Laney, Equitable Life Assurance Soc. (122 ft. 2 in.)
 Javelin throw—Amelia Wershoven (138 ft. 10 in.)
 Leading team scores—Chicago Comets 34; Tennessee State 22; German-American A.C., Brooklyn, N.Y., 10

(Outdoors, at Ponca City, Okla., June 17-18, 1955)

50 yd.—Isabel Daniels (6 sec., meet record; former mark 06.1),
 100 yd.—Mae Faggs, Tennessee State (10.8, Faggs set meet and American record of 10.7 in preliminary; former mark 10.8)
 220 yd.—Mae Faggs (25.1, meet record; former mark 25.4)
 80-m. hurdles—Bertha Diaz, Cuba (11.5, American record, former mark 11.7)
 440-yd. relay—Tennessee State (Martha Hudson, Lucinda Williams, Isabel Daniels and Mae Faggs), (49.1, meet record; former mark 49.4)
 Baseball throw—Amelia Wershoven (249 ft. 1½ in.)
 Shot-put—Wanda Weizgrowski, Polish Falcons (37 ft. 4½ in.)
 Discus—Alejandra Ibarra, Cuba (117 ft. 8 in.)
 Javelin—Karen Anderson, Mercury A.C., Landsdowne, Pa. (150 ft. 1¼ in.; meet record, former mark 139 ft. 3 in.)
 Broad jump—Nancy Phillips (17 ft. 5¼ in.)
 Running high jump—Mildred McDaniel (5 ft. 6½ in.; American record; former mark 5 ft. 6¼ in.)
 Leading team scores—Tennessee State 87½; Chicago Comets, 59½; Equitable Life Assurance Soc., 38)

National A.A.U. Outdoor Distance Events

15 kilo run—Browning Ross, Penn A.C. (54 min. 02 sec.)
 20 kilo run—Charles Robbins, N.Y. Pioneer club (1:10:47)
 25 kilo run—Browning Ross (1:24:35)
 30 kilo run—Browning Ross (1:21:25)
 Marathon—Nick Costes, unattached (2:31:12.4)
 10 kilo walk—Henry Laskau, 92d St. Y.M.H.A. (48:43.3)
 15 kilo walk—Henry Laskau (1:14:46)
 20 kilo walk—Henry Laskau (1:44:08)
 25 kilo walk—James Hewson, St. Francis Xavier A.C., Buffalo, N.Y. (2:14:32)
 30 kilo walk—Alex Oakley, Ontario, Can. (2:36:11)
 35 kilo walk—Leo Sjogren, Finnish American A.C. (3:17:57)
 40 kilo walk—Guillermo Weller, Argentina (3:40:58)
 50 kilo walk—Leo Sjogren (4:30:57)

Other A.A.U. Outdoor Champs

Men's decathlon—Bob Richards, Los Angeles A.C. (6,873 points)
 Men's pentathlon—Des Koch, unattached (3,216)
 Women's pentathlon—Barbara Mueller, Chicago Comets (3,539)
 Men's all-around—Lyman Frasier, Baltimore (Md.) Olympic club (6,733)

Intercollegiate A.A.A. Championships

Indoors, at New York, Feb. 26, 1955

60 yd.—John Haines, Pennsylvania (6.3 sec.)
 600 yd.—Charles Jenkins, Villanova (1 min. 11.2 sec.)
 1,000 yd.—Arnold Sowell, Pittsburgh (2:14.7)
 One mile—Alex Breckenridge, Villanova (4:19.9)
 Two mile—George Terry, Boston U. (9:16.8)
 60-yd. high hurdles—Charles Pratt, Manhattan (0:07.4)
 One-mile relay—Pittsburgh (Ed Saunders, Joe Dudas, William Green, Arnold Sowell), (3:19.8)
 Two-mile relay—Syracuse (Robert Milner, Les Vielbig, Steve Armstrong, Don Shupe), (7:49.1; Syracuse ran 7:40.9 in trial heat for meet record; former mark 7:41.6)
 35-lb. weight throw—Stewart Thomson, Yale (58 ft. 1¼ in.)
 Broad jump—Bernard Bruce, Boston U. (23 ft. 10¼ in.)
 High jump—Wilfred Lee, Pennsylvania (6 ft. 6 in.)
 16-lb. shot-put—Roosevelt Grier, Penn State (53 ft. 4½ in.)
 Pole vault—Don Bragg, Villanova, and Dave Seed, California, tied (14 ft.)
 Leading team scores—Manhattan 27; Villanova 22½; Penn State 18

(Outdoors, at New York, May 27-28, 1955)

100 yd.—John Haines, Pennsylvania (9.5 sec., meet record; former mark, 09.6)
 220 yd.—Art Pollard, Penn State (20.8)
 440 yd.—Charles Jenkins, Villanova (47.2)
 880 yd.—Arnold Sowell, Pittsburgh (1 min. 49.1 sec., meet record; former mark 1:50.3; new national collegiate record; former mark 1:49.8)
 One mile final—Burr Grim, Maryland (4:09.9, meet record; former mark 4:10.3)
 Two mile—George King, New York U. (9:15.7)
 120-yd. high hurdles—Joel Shankle, Duke (14.1, tied meet record)
 220-yd. low hurdles—Charles Pratt, Manhattan, (23.0)
 One-mile relay—Villanova (James Moran, Eugene Maliff, Al Peterson, Charles Jenkins), (3:15.2)
 Javelin throw—Al Cantello, La Salle, Philadelphia (228 ft. 8½ in., meet record; former mark 225 ft. 2¼ in.)
 Hammer throw—Don Seifert, Brown (186 ft. 10 in., meet record; former mark 183 ft.)
 Discus throw—Roosevelt Grier, Penn State (170 ft. 6 in.)
 Shot-put—Roosevelt Grier (57 ft. 11 in.)
 Broad jump—Joel Shankle, Duke (24 ft. 8 in.)
 Pole vault—Don Bragg, Villanova (14 ft. 6 in., meet record; former mark 14 ft. 5½ in.)
 High jump—Wilfred Lee, Pennsylvania (6 ft. 6½ in.)
 Leading team scores—Manhattan, N.Y., 38; Penn State, 35¼; Boston U., 17½

National Collegiate A.A. Championships

(Outdoors, at Los Angeles, Calif., June 17-18, 1955)

100 yd.—Jim Golliday, Northwestern (9.6 sec.)
 220 yd.—Jim Golliday (21.1)
 440 yd.—J. W. Mashburn, Oklahoma A. & M. (46.6)
 880-yd.—Tom Courtney, Fordham (1 min. 49.5 sec., meet record; former mark 1:50.3)
 One mile—Jim Bailey, Oregon (4:05.6)
 Two mile—Ken Reiser, Oregon (9:04.5)
 120-yd. high hurdles—Milt Campbell, Indiana (13.9, tied meet record)
 220-yd. low hurdles—Charley Pratt, Manhattan (23.1)
 Broad jump—Joel Shankle, Duke (24 ft. 3¼ in.)
 Javelin throw—Les Bitner, Kansas (246 ft. 1 in., meet record; former mark 228 ft. 8½ in.)
 Discus throw—Des Koch, Southern California (176 ft. ¾ in.)
 High jump—Ernie Shelton, Southern California (6 ft. 11½ in., meet record; former mark 6 ft. 10½ in.)
 Pole vault—Don Bragg, Villanova (15 ft. 1 in., meet record; former mark 14 ft. 9 in.)
 Leading team scores—Southern California, 42; University of California at Los Angeles (U.C.L.A.), 34; Kansas, 30

Trinidad and Tobago. This British colony consists of two islands off South America north of the Orinoco delta. Area: 1,980 sq.mi. (Tobago, 116 sq.mi.). Pop.: (1946 census) 557,970 (Tobago 27,208), including 261,485 Africans, 195,747 East Indians and 78,775 coloured (mixed); (1954 est.) 710,000 (about 5% in Tobago). Language: English, Hindi, French, Spanish. Religion: Christian 70% (of which one-half Roman Catholic, one-third Anglican), Hindu 23%, Moslem 6%. Chief towns (pop. 1953): Port of Spain (cap.) 111,150; San Fernando (port) 35,000. Governors in 1955: Major General Sir Hubert Rance and (from June 23) Sir Edward Beetham.

History.—On Dec. 10, 1954, the legislature of Trinidad and Tobago accepted the plan for a British Caribbean federation (command paper no. 8895 of 1953), subject to a further conference on immigration and a capital. Yellow fever travel restrictions ceased on Jan. 7. A committee on constitutional reform was appointed in January. The San Fernando Technical Training institute was opened on Feb. 23. On May 6 income taxation was reduced. The report of a board of inquiry into a wage dispute in the oil industry was published on June 18. Reports on the treatment of leprosy in Trinidad by Ernest Muir of the British Empire Leprosy association and Lauro de Souza Lima of the UN World Health organization were published on Aug. 4. In August the city public transport system of the Port of Spain corporation electricity board was taken over by Ahamand Transport service. On Sept. 6 the life of the legislature was extended from Sept. 26 to May 26, 1956, as requested by the legislature on April 15. The government donated \$150,000 toward a central fund which it established to relieve devas-

tation caused by the hurricane on Sept. 22 in Grenada, Carriacou and Barbados. Supplies, personnel and equipment were rushed to these islands.

(H. E. CN.)

See H. Dow (ed.), *Trinidad and Tobago Year Book, 1955* (Port of Spain, 1955).

Education.—Schools (1953): primary and intermediate 502, pupils 137,031; secondary 29, pupils 11,581. Teachers' training colleges 3, students 218. Vocational: Eastern Caribbean Farm institute; San Fernando government technical college (opened 1954); Imperial College of Tropical Agriculture, students 84. Extra-mural classes in Trinidad, intermediate level, of the University College of the West Indies.

Finance and Trade.—Monetary unit: British West Indian dollar, valued in 1955 at about 58 cents U.S. Budget (1955 est.): revenue B.W.I. \$74,700,000; expenditure B.W.I. \$73,800,000. Foreign trade (1954): imports B.W.I. \$243,840,000; exports (including re-exports) B.W.I. \$261,600,000. Production (long tons, 1954) crude oil 3,328,000; sugar 174,000; cocoa (exports) 7,880,000; asphalt (1953) 43,000; asphalt cement 34,000.

Tropical Diseases. The older concept that many diseases are peculiar to warm climates is being gradually modified with the knowledge that most infections in the tropics are cosmopolitan. However, because of climatic conditions, inadequate nutrition, poor personal hygiene and environmental sanitation, unusually favourable opportunities are provided for many diseases to be hyperendemic or to develop epidemically in extensive tropical areas. Common examples are malaria, intestinal parasitism, deficiency diseases, trachoma, smallpox, tuberculosis, treponematoses, blood fluke infection and filariasis. Coupled with this knowledge is the realization that control cannot be accomplished solely by diagnosing and treating individual patients. Valuable as this is, it must be co-ordinated with the more comprehensive program of providing nutritious food, improving environmental conditions to reduce the hazards of disease transmission, immunizing communities where this is practical, and educating them in methods of safeguarding their health. For nearly a decade the World Health organization (WHO) of the United Nations, in close co-operation with local health agencies, has developed programs working toward these ends.

Malaria.—During 1955 efforts were continued to control this disease. Considerable reduction was effected in some tropical countries, yet in Africa and southeast Asia the situation was still formidable. It was authoritatively estimated that in 1955 about 10% of the world's population, or 250,000,000 persons, had clinical attacks of malaria, and about 1% of these died of the disease. Eradication of malaria from tropical America was the present goal but this would require an expenditure of \$100,000,000 whereas only a few hundred thousand were available. Moreover, during 1955 there were increased instances of malaria mosquitoes becoming resistant to residual spraying of homes with DDT; the most dangerous transmitter in tropical America, *Anopheles darlingi*, cannot be controlled by this technique since characteristically it does not rest on the walls of habitations but takes a blood meal, then flies into tall savanna grass.

Deficiency Diseases.—In 1955 this group of diseases continued to constitute a basic, essentially unsolved practical problem. In many tropical countries there is adequate carbohydrate in the diet from maize, polished rice, taro and other starchy foods, but vitamins, proteins and fats are inadequate and in some areas almost completely lacking. These deficiencies are responsible for high frequency of spruelike syndromes, scurvy, pellagra and beriberi, and reduce energy and resistance to infectious diseases, particularly in young children. In Africa milch cattle introduced from Europe were being mated with local stock to produce disease-resistant breeds to increase fresh milk supplies. Attempts were also being made to add vitamin A and D supplements to powdered skim milk for children in areas where cattle were not being raised or were unprofitable because of animal trypanosomiasis. In some regions of Africa fish were

being stocked in rivers and lakes to supply animal protein. One of the difficulties encountered in providing adequate diets was the reluctance of native populations to consume unaccustomed foods. Development of new varieties of vegetables commonly eaten by a population, with greatly enhanced vitamin content, was found to solve one of these difficulties.

Smallpox and Tuberculosis.—These diseases continued to be common throughout tropical countries. Pilot studies were initiated to immunize children simultaneously with vaccinia virus and BCG. Several years would be required to evaluate results.

Treponematoses.—Penicillin treatment was continued in several tropical countries in long-time programs to control yaws (framboesia, pian) and syphilis, diseases produced by closely related species of *Treponema*. Yaws is almost exclusively a tropical infection; syphilis is becoming increasingly common in the tropics with the development of industrial cities and migration of rural populations to urban centres. Although comprehensive statistics were not available, control of yaws appeared to be developing satisfactorily.

Filariasis.—Early in Dec. 1955 a study section of WHO was convened at Kuala Lumpur, in Malaya, to assess the status of Bancroftian and Malayan filariasis. Special consideration was given to the distribution of these diseases in extensive tropical areas, their epidemiology, methods of transmission by mosquitoes in different regions, characteristic pathology and symptoms, and evaluation of control measures presently being tried. Like the similar conference on onchocerciasis (another type of filariasis) held in Mexico City the previous fall, the value of this conference consisted in providing expert opinion based on research and practice in different parts of the tropics with respect to future methods to be employed in combating these infections.

Blood Fluke Disease.—During 1955 primary emphasis in the investigation of this disease (schistosomiasis, bilharziasis) was placed on the natural history of the snail intermediate hosts that harbour the fluke before it escapes into fresh water in the stage infective for man. In extensive endemic areas in Africa, the middle east and Brazil, practical control of the disease by destruction of the snail had become increasingly urgent as irrigation projects nearing completion were likely to carry the snails into territory contiguous to their present distribution. Sodium pentachlorophenate (Santobrite) continued to demonstrate its usefulness in killing the snails and thus in preventing the parasite from developing to the infective stage for man. In parts of Africa, however, the use of this chemical in streams had the serious disadvantage that it also killed fish which had been stocked to provide essential animal protein for the population.

Yellow Fever.—Urban yellow fever was reported in 1955 only in isolated villages near forested areas in central Africa. In northern South America and in Central America the centres of jungle yellow fever were under close surveillance. The northern limit of the recent extension of the disease in Central America had for the time being become established in Honduras, although there was the possibility that it might reach the dense forests of northern Guatemala and southern Mexico, then break out in the nearby Gulf coast cities. In the jungle, monkeys are primarily attacked by the disease, but in eastern Colombia and possibly elsewhere in the Americas marsupials are probably involved in regions where monkeys are relatively uncommon. The mosquito transmitters in the jungle are species of *Haemagogus*, the habits of which are still poorly understood. Since there is no specific treatment for yellow fever, control measures being pursued in tropical America consisted of (1) immunization of persons likely to be exposed to the disease in and adjacent to the enzootic jungle areas and (2) continued efforts to prevent the breeding of the urban mosquito transmitter, *Aedes aegypti*.

Immunization of persons visiting northern South America, Trinidad and the enzootic countries of Central America was required for re-entry into the United States.

Trichinosis.—Although this parasitic disease is uncommon in warm climates, its increasing prevalence in the United States had become a matter of serious concern to private physicians and health authorities. Almost every week during 1955 there were confirmed reports of epidemics of the disease, usually in small but occasionally larger groups, in all areas of the United States except the southeast. The typical history of these cases is that they consumed sausage or other pork products immediately preceding the first symptom of the disease, *e.g.*, “acute food poisoning.” In some instances the meat came from federally-inspected slaughterhouses. The infected meat contained the encysted viable stage of the etiologic agent, *Trichinella spiralis*. Consumption of inadequately cooked or otherwise insufficiently processed pork was therefore responsible for the infection.

Resettlement of Populations in the Tropics.—Vast regions in the tropics as yet essentially unpopulated are potentially valuable for settlement of persons from overpopulated areas, to relieve congestion and provide land to grow new crops of food. In some localities virgin land is fertile; in other areas, with the extension of irrigation it would become highly productive. In both instances it was apparent in 1955 that disease hazards were a definite handicap to these immigrants unless steps were taken immediately to safeguard the health of the immigrants. Measures which were being developed consisted in basic environmental sanitation of the new settlements to prevent outbreaks of enteric diseases; insecticidal control against malaria, trypanosomiasis in man and livestock; immunization against small-pox, tuberculosis, and yellow fever where this constitutes a liability; control of blood fluke disease in several areas by destruction of the snail intermediate hosts; and encouragement of the population to cultivate more nutritious crops and better domestic animals which would supply an adequate, balanced diet. Trust Territories. These include former German colonies and islands which became mandates after World War I and trust territories after World War II; South-West Africa, which remained mandated; and the former Italian Somaliland (now Somalia) which became a trust territory under Italian administration on April 1, 1950. Total area: 1,229,406 sq.mi.; total population about 21,707,000. Certain essential information is given in the table.

History.—Major steps towards eventual self-government in certain trust territories gave special significance to the two regular sessions held by the Trusteeship council of the United Nations during 1955. At the conclusion of the 16th session on July 22 the president, Mason Sears (U.S.), pointed out that four of the 11 territories had “clearly reached advanced stages in their evolution towards self-government.” They were Togoland and Cameroons under British administration in west Africa, Western Samoa under New Zealand administration in the Pacific, and Italian-administered Somalia. These developments

Trust and Mandated Territories			
Territory	Area (in sq.mi.)	Population	Administering Authority
South-West Africa*	317,725	437,000 (1953 est.)	South Africa

*Mandate. †Northeast New Guinea, Bismarck archipelago, certain of the Solomon Islands. ‡Marshall, Caroline and Mariana Islands, former Japanese mandates.

brought an increased burden of responsibility to the competent UN organs, particularly the Trusteeship council.

During the 15th session (Jan. 25 to March 28) the reports of the administering authorities on Tanganyika and Ruanda-Urundi were examined in conjunction with the findings of visiting missions. Conditions in Cameroons and Togoland (British) and in Cameroon and Togo (French) also came under review, and the council found time to deal with 198 of the 335 petitions on its agenda. With regard to Ruanda-Urundi the visiting mission had suggested a program leading to self-government within a period of between 20 and 25 years. Belgium, as administering authority, opposed fixing a time limit, both as a matter of principle and also on practical grounds.

Even more vigorous controversy was occasioned in the council by the visiting mission's proposals concerning Tanganyika. It first postulated that a self-governing or independent Tanganyika would inevitably be a state primarily African in character, with a government mainly in African hands. Secondly it urged that, in order to develop “a stronger sense of purpose,” a definite period should be fixed, within which the goal of self-government should be achieved. Impressed with the general progress in the territory, the mission took the view that the period should be shorter than in the case of Ruanda-Urundi. At the council, virtually every major recommendation was rejected by the United Kingdom. In particular, it opposed the idea of a “political timetable.” The debate on this question left the council so divided that seven of the 12 members abstained from voting on the final resolution.

When the council met for its 16th session (June 8 to July 22) Somalia under Italian administration received the chief share of attention. That territory had reached the half-way stage along the road to promised independence in 1960. Altogether the council adopted 35 conclusions and recommendations touching upon all aspects of development. In view of the continued failure of efforts to reach agreement on the frontier to be fixed between Somalia and Ethiopia, the council recommended that the UN secretary general appoint a mediator.

New Zealand, as administering authority for Western Samoa, reported on the representative convention called to consider a constitutional plan for a future self-governing state. The government had agreed to the convention's proposal that there should be a new single legislature and suggested that it should be convened toward the end of 1957.

Many of the 473 petitions considered by the council at its 16th session concerned either French Cameroun or Somalia. One of the two visiting missions appointed was instructed to inquire into the “serious civil disorders” which had recently occurred in the former territory. The second mission was given the responsibility of investigating the special political problems in British Togoland and in French Togo.

The UN general assembly's committee on South-West Africa reported in June that it had found “no significant improvement” during the previous year in the welfare of the native inhabitants of the territory. On June 7 the International Court of Justice, in an advisory opinion, unanimously upheld the vot-

ing procedure adopted by the general assembly in dealing with reports, petitions and other matters concerning South Africa's administration of the former mandated territory.

(L. R. A.)

Trust Territory of the Pacific Islands: see MARSHALL, CAROLINE AND MARIANA ISLANDS.

Tuberculosis. Tuberculin testing was practised more extensively in 1955 than in any previous year. Leona Baumgartner, commissioner of health, New York city, announced that all pupils entering public and 24 Catholic high schools would be given the tuberculin test.

The incidence of reactors varied throughout the world depending upon control programs previously employed. G. Drolet and A. Lowell (New York) assembled percentages of tuberculin reactors at age 15 years in various areas in recent years. In the large cities of India, it was 72 to 77, Poland 67, England (Wales and Scotland) servicemen on entry (18-20 years) 65.6, Korea 60, Formosa urban 60, rural 40, Yugoslavia 59, Tunisia 53, Egypt 52, Mexico 46 to 52, North Africa 51, Ecuador 49, Austria 33, New York (Manhattan, Bronx, Brooklyn) 12, Queensborough 9, United States navy recruits (17-20 years) 10.6, navy and marine corps recruits and midshipmen 11.3 in 1950 and 4.6 in 1954.

The best method of diagnosing pulmonary tuberculosis consisted of testing persons of all ages with tuberculin, making X-ray film inspections of reactors periodically and completing examinations when shadow-casting areas of disease appeared.

The United States public health service announced that in 1953, of 89,000 active or probably active cases newly reported, 78% were in an advanced stage.

Morbidity.—In nations with the largest populations the case rate continued high. C. Mani said that there were probably 2,500,000 open infective cases in India. G. Drolet and A. Lowell assembled case rates in several parts of the world. Between 1947 and 1953 reported cases in Denmark decreased 53%, and the percentage of decrease in other countries during the same period was as follows: Iceland 49, Sweden 47, Germany 45, North Ireland 43, Finland 38, Canada 34, U.S. 29, New Zealand 25, Norway 23, France 16, England and Wales 14, Scotland 12.

Mortality rates decreased precipitously because drugs were available which postponed death for numerous persons. The case rate declined more slowly because of a large reservoir of tubercle bacilli in many persons who previously were well. Among them the annual crop of gross disease evolved just as it had in previous years. If a drug had been available which could have reached and destroyed the tubercle bacilli in the old walled-off areas of disease from which new disease emanates, the case rate could have dropped as rapidly as the mortality rate. Without such a drug, as much gross disease developed among previously infected persons as at any time in history. The decrease in number of cases which did occur was the result of previous control measures which reduced the incidence of infection. The smaller the number of infected persons, the fewer gross areas of disease develop.

Mortality.—G. Drolet and A. Lowell produced graphs showing mortality rates from tuberculosis from 1930 to 1953 in 31 countries. Almost without exception, these graphs showed a precipitous decrease since 1947. The common factor to all which apparently was responsible was antimicrobial drugs.

In the United States from 1942 to 1946 an average of 2,348 children from birth to 15 years died annually of tuberculosis. In 1949 there were 1,581 such deaths, but in 1953 only 700. In the Netherlands J. D. DeHaas said that deaths from tuberculosis in persons up to 19 years decreased from 314 in 1949 to 64 in 1953.

Treatment.—Regular conferences were held on chemotherapy of tuberculosis for the Veterans administration army-navy study. This study, the largest ever undertaken in chemotherapy, included investigations on the effectiveness of new drugs and on methods of administering and efficacy of the older ones. The council on pharmacy and chemistry of the American Medical association authorized publication of an extensive report by D. S. King (New Hampshire) which was an excellent summary of the findings of this prolonged and elaborate study. The Tuberculosis Chemotherapy Trials committee of the British Medical Research council issued its seventh report. This continuing study was establishing important facts as to values of drugs. The Committee on Chemotherapy and Antibiotics of the American College of Chest Physicians reported that there was no generally accepted "optimum" for regimen in chemotherapy in the treatment of tuberculosis. Streptomycin, para-aminosalicylic acid (sodium) and isoniazid were the three most commonly used drugs, but there was no unanimity of opinion as to which combination was most effective. Best results were obtained when two or more drugs were combined and given continuously for a long time, at least a year, even in minimal cases, and in advanced cases a total of 18 months or longer. Several new drugs were studied, but none had passed the experimental stage.

With evidence indicating that antimicrobial drugs administered to recent tuberculin converters protects against tuberculous meningitis, the United States public health service established a large meningitis prophylaxis program among children under two years old in various parts of the United States. The United States Indian bureau planned a similar project among Indian children of the same age.

Indications for surgical removal of tuberculous areas in the lungs were revised with tempering of previous enthusiasm. C. Muschenheim (New York) recommended surgery for those with persistent cavities and positive sputum for six months or longer, but for residual closed lesions there was a trend not to resect. He pointed out that pneumothorax accompanied by drugs should not be completely discarded.

L. D. Eerlander *et al.* (Netherlands) reported on the post-operative course of treatment in segmental resection of 289 persons with tuberculous caseous focuses or cavitation. The follow-up at least six months after surgery revealed that 97.1% had negative sputum. More than 90% had resumed work or were ready to do so. The number of good results decreased with increasing time of observation.

In Denmark, Finland and Sweden segmental resection was not done for minimal tuberculosis save in exceptional cases.

Prevention.—The use of various "vaccines" to prevent tuberculosis continued in many places. The World Health organization published a report on 30,000,000 persons tested with tuberculin and 14,000,000 who received BCG over a three-year period in 23 countries, mostly in eastern Europe, southern Asia, southern Africa, Ecuador and Mexico. The campaign was continued with 90,000,000 people tested and 36,000,000 who received BCG (not yet officially reported) in 30 other countries. The work was done by an international staff of 200 doctors and 300 nurses in co-operation with hundreds of doctors and nurses and BCG technicians of the nations involved at a total cost of about \$10,000,000.

Special Groups and Problems.—J. D. Aronson *et al.* (Philadelphia) reported that on certain Indian reservations 52.8% of children of 5 to 19 years of age reacted to tuberculin in 1936 and 1937 whereas only 23.7% reacted in 1954. The Minnesota department of health reported that in 1937 the tuberculosis death rate among Indians was 16 times that of the general population, but in 1954 no death from tuberculosis occurred among Indians in that state. This phenomenal accomplishment was

attributed to mass X-ray surveys, tuberculin testing of all Indian school children and modern treatment facilities. M. Pollock *et al.* (Illinois) found among mentally ill war veterans a reactivation rate of 31.1 per 1,000 person-years, while the incidence rate was 5.7 per 1,000 person-years among those with no history of tuberculosis. Shock treatment for mental conditions had no deleterious effect on tuberculosis.

Leaving institutions against advice increased partially because of the belief that antimicrobial drugs administered at home were adequate. Dan Morse stated that the greatest defect in the tuberculosis program in Peoria and throughout the state of Illinois was inability to properly control activities of noncooperative cases of tuberculosis who insisted on roaming communities at will, spreading disease to others.

Papers presented before the Belgian Society for Scientific Study on Tuberculosis pointed out that in France bovine tubercle bacilli were found in 2% to 5% of tuberculous patients. This type of tuberculosis was relatively high in England, Scotland and Switzerland, but almost nonexistent in the United States.

J. T. Andres (Switzerland) stated that 18% to 20% of the cattle of Switzerland were infected with tubercle bacilli and that 300,000 reactor animals were still to be destroyed. Of the 9,210,810 cattle tested in the United States, 0.12% reacted to tuberculin. (See also EDUCATION.)

Tunisia. A French protectorate in North Africa, Tunisia lies between Algeria (west) and Tripolitania (east). Area: 48,332 sq.mi. Pop.: (1946 census) 3,230,952; (1954 est.) 3,700,000; 87.6% Moslem and Arabic-speaking (Arabs and Berbers), but including (1946) 239,249 Europeans (143,977 French citizens [many Italian-born] and 84,935 Italians) and 71,543 Jews. Chief towns (1946 census): Tunis (cap.) 364,593, including 119,222 Europeans; Djerba 59,331; Sfax 54,637; Bizerte 39,327; Sousse 36,566. Ruler, Bey Mohammed el-Amin. Prime minister in 1955, Tahar ben Ammar. French representatives in 1955: Gen. Pierre Georges Boyer de Latour du Moulin as resident general and (from September) Roger Seydoux as high commissioner.

History.—Pierre Mendès-France had promised internal autonomy to Tunisia in July 1954, and the Franco-Tunisian conversations in Paris, initiated to implement this promise, came to an end on April 22, 1955. Edgar Faure and Tahar ben Ammar signed a protocol of agreement comprising nine conventions on the following points: Franco-Tunisian association; maintenance of the French public services; economic, financial, technical, administrative and cultural co-operation; control of the southern frontier; French tribunals and mixed tribunals; the establishment of a court of arbitration; French representation on the municipal councils.

The conventions were well received by public opinion in Tunisia, except in Old-Destour circles. Frenchmen of the *Présence Française* movement protested; and their president, Gen. Marcel Rime-Bruneau, was expelled from the country. After a demonstration by 12,000 French people in Tunis, on May 17, *Présence Française* became calmer and most of the French inhabitants seemed to accept the conventions.

On June 1 Habib Bourguiba, who had played an essential role in the conversations, returned from exile and was welcomed by

HABIB BOURGUIBA, Tunisian nationalist leader, receiving a farewell kiss from an enthusiastic follower as his train departed from Paris, Fr., in May 1955. Bourguiba was returning to Tunisia after three years of exile in France

a crowd of hundreds of thousands of Tunisians, come together from all over the country. On June 3 the conventions were signed definitively, and Bourguiba declared: "Tunisian sovereignty has been established in friendship with France."

On July 9 the national assembly in Paris ratified the conventions by an immense majority. On Sept. 6 the economic aid financial convention was signed: Tunisia was to remain in the franc zone, the Tunisian franc staying at par with the metropolitan franc; a Tunisian credit council was set up; and there was to be a customs union between Tunisia and France.

At the end of August General Boyer de Latour left Tunisia and early in September Roger Seydoux was appointed high commissioner for France there. The cabinet responsible for the negotiations resigned, but Tahar ben Ammar reappeared as president of the council in a cabinet of 12 ministers, including five Neo-Destour members and one Jew. On Sept. 21 the bey issued a decree reorganizing the system of government as follows: legislative decrees were to be examined by the council of ministers before receiving the bey's seal; ministers were to be answerable to the bey; the post of secretary-general, formerly reserved for a Frenchman, was to be abolished; most of the functions of administration were to be exercised by the caids; and the civil controllers were to be no more than the high commissioner's delegates.

Prince Sadok, heir to the throne, died on Oct. 1.

Salah Ben Youssef, secretary-general of the Neo-Destour party, returned from Cairo in September and began a campaign against the conventions, which he regarded as "a backward step." On Oct. 31 he was excluded by the directing committee of the party. (See also FRENCH UNION.) (HU. DE.)

Education.—(1953) Primary 211,927; secondary 16,679; vocational 13,411; higher institutes 1,473.

Foreign Trade.—Monetary unit: Tunisian franc=metropolitan franc. In 1955, 350 metropolitan francs=U.S. \$1. (1954) Imports 59,268,000,000 fr., including 44,000,000,000 fr. from France; exports 44,214,000,000 fr.,

including 25,000,000,000 fr. to France.

Production.—(Metric tons, 1954) wheat 606,000; citrus fruit 39,000; olive oil 52,000; grapes for wine 133,000; dates (1953) 28,000. Iron ore (60% metal content) 949,000; phosphate (1953) 1,719,000.

Tunnels. In 1955 new records for fast tunnelling progress were claimed by construction crews in Scotland, Australia and Sweden. All three record claims appeared to be justified as each represented a different size tunnel. In Scotland workers on the 10-ft.-diameter Glenalmond tunnel of the North of Scotland Hydro-Electric board's Breadalbane project claimed a new European record with 428 ft. of progress in seven working days. In Australia a record of 409 ft. of progress in a six-day week was established on the 24-ft.-diameter Eucumbene-Tumut tunnel of the Snowy mountain project. And in Sweden, where extra large tunnels are measured on a square-foot basis, a six-day work week record of 145 ft. was made on a 1,410-sq.ft. heading on the Harresele project.

Of interest is the fact that all three of the records were set on hydroelectric-project tunnels. Major tunnel emphasis in 1955 all over the world centred on hydroelectric projects with water supply, sewer and transportation tunnels not as prominent as previously.

Africa.—Two big hydroelectric projects involving tunnels were in the preliminary stages in Africa in 1955. In Northern Rhodesia the Kafue gorge dam involved a 13½-mi., 20-ft. diameter tunnel. In Egypt the High Aswan dam included six 55-ft.-diameter, 3,600-ft.-long tunnels.

Asia.—The newest hydroelectric project in Asia involving tunnels was the Litani river project in Lebanon. This included the 5½-mi.-long Bisri tunnel and a shorter tunnel to service the Juniye power plant.

In India work continued on the Bahihal tunnel, a 2-mi. bore that would provide an all-weather vehicular link between India and Kashmir.

Europe.—The greatest tunnelling activity in Europe was concentrated in Sweden, with most of the Swedish work on hydroelectric developments. The Harresele—a private power development on the Ume river—had a large discharge tunnel and an underground powerhouse. The powerhouse was 52½ ft. wide, 295 ft. long and 108 ft. high. The discharge tunnel was 49 ft. wide, 59 ft. high and 11,154 ft. long. The 2,691-sq.ft. section of the Harresele discharge tunnel was being driven in two stages. A full-face top heading of 1,410 sq.ft. was proceeding at a record-breaking rate for such large-size tunnels. The best month was May with a 515-ft. advance, and the record-setting week was in June with a 145-ft. advance. The remaining 1,281 sq.ft. of section forming a 26-ft.-high bench was to be removed by wagon drilling and blasting.

Farther down on the Ume river, the Swedish government was undertaking the Stornorrfor's project that included the biggest tunnel ever undertaken. The 2½-mi. discharge tunnel was about 53 ft. wide and 77 ft. high with a net section of 3,875 sq.ft. It was to be excavated in stages with a top heading of 1,720 sq.ft. started in mid-1955. This would be followed by two benches of about 1,100 sq.ft. each with the heading driven in its entirety before benching starts. The Stornorrfor's underground power plant was 60 ft. wide, 400 ft. long and 146 ft. high.

The other big Swedish project was a combination air raid shelter and parking garage in the Stockholm area. This underground structure included a 1,000-ft. tunnel 42 ft. wide and 32 ft. high with 85-ft.-diameter circular rooms at each end and with access tunnels to the surface. It was nearly completed during 1955 and would accommodate 600 cars or 6,000 people, and was capable of taking care of 20,000 people in an extreme emergency.

Big hydroelectric projects were completed in 1955 in Austria and Switzerland. In Austria the Glockner-Kaprun project had

15.6 mi. of tunnel. This work involved one of the world's largest pumped storage projects. In Switzerland the Oberhasle power system had 44 mi. of tunnels.

In England a 2,060-ft. tunnel went into service in 1955 providing vehicular access to the London airport. The tunnel had four 10-ft. vehicular lanes together with cyclist lanes and pedestrian ways.

North America.—Two tunnels in serious trouble in 1954 showed better progress in 1955 but were not completely "out of the woods." The 6.4-mi. Tecolote tunnel near Santa Barbara, Calif., was holed through in January after more than a year's delay caused by hot water up to 116° F. The U.S. bureau of reclamation water-supply bore was being concrete lined but the large quantity of hot water made lining progress slow.

Work on the Koolau mountain traffic tunnel in Honolulu, T.H., was virtually at a standstill for an entire year following the cave-in that killed five men Aug. 14, 1954. After many investigations, a concrete plug was cast across the face of the tunnel and work was restarted, using the pilot drift method rather than the full-face construction method. Responsibility for the cave-in and extra costs involved had not been adjudicated.

In contrast with other areas, hydroelectric tunnels, though substantial in number, do not predominate in North American construction. During 1955 considerable work was under way on sewer, water and vehicular tunnels.

On the west coast three hydroelectric tunnels were started. These were a 24-ft.-diameter, 6¾-mi. tunnel for the Poe project of Pacific Gas and Electric Co.; a 20-ft.-diameter, 5-mi.-long tunnel for the Cheakmus project of British Columbia Electric; and the 12½-ft. horseshoe section, 5½-mi.-long Donnell's tunnel for a group of irrigation districts in central California. The biggest hydroelectric tunnelling work on the east coast was on the Quebec Hydro-Electric commission's Bersimis project. Construction was well under way on a 7½-mi., 31-ft.-diameter tunnel and the project was to have an underground powerhouse 65 ft. wide by 80 ft. high by 565 ft. long.

Water-supply tunnels included the 1.3-mi., 10-ft.-diameter San Juan tunnel for the Metropolitan Water district of southern California, holed through in 1955. Started in 1955 was a system of 6-mi. of water tunnels to connect Chicago's central district filtration plant with the city's water system. Still under way was a 7-mi., 10-ft.-diameter tunnel in Boston, Mass. New York city completed the East Delaware tunnel and called bids for the West Delaware tunnel. The latter included 44 mi. of concrete-lined pressure tunnel 11¼ ft. in diameter. Due to start soon was the 23-mi. Montezuma tunnel under the continental divide, a key feature in a \$98,000,000 water-supply program for Denver, Colo.

Included in the sewer tunnels active in 1955 was a 5,000-ft., 48-in. line in Providence, R.I.; two 30-in.-diameter lines in Cincinnati, O.; a 9,000-ft. tunnel in Edmonton, Alta.; 12,800 ft. of 72-in.-diameter tunnel in Nashville, Tenn.; and 15,300 ft. of 7-ft.-diameter tunnel connecting the La Cienega and San Fernando valley regions of Los Angeles, Calif.

On vehicular tunnels, the 1.5-mi.-long third tube of the Lincoln tunnel in New York was more than half completed. Work started on a 1.7-mi. Baltimore harbour tunnel and work progressed on a 1.5-mi. tunnel under Hampton Roads at Norfolk, Va. In New Orleans, La., construction was under way on two traffic tunnels, the Harvey tunnel and the Belle Chasse tunnel. In California the 1,000-ft.-long, 46½-ft.-wide Waldo tunnel on the Golden Gate bridge approach was completed.

At the corps of engineers Oahe dam near Pierre, S.D., a contract was let for the downstream half of six 3,450-ft.-long, 22-ft.-diameter tunnels. Contracts were already under way for the upstream half of the flood-control bores. The work was being

done by a huge machine with a rotating head that literally chews out the soft ground without using dynamite. (L. L. WE.)

Turbojets and Turboprops: see AVIATION, CIVIL; JET PROPULSION.

Turkey. A republic in the southeastern Balkans and Asia Minor, Turkey is bounded west by the Aegean sea, northwest by Greece and Bulgaria, north by the Black sea, northeast by the U.S.S.R., east by Iran and south by Iraq, Syria and the Mediterranean. Area: 296,185 sq.mi., including 9,256 sq.mi. in Europe. Pop.: (1950 census) 20,947,188, including about 1,600,000 in European Turkey; (1955 census, provisional) 24,111,778. Languages (1950): Turkish 87.3%; Kurdish 8.8%; also Arabic, Greek, Armenian, Georgian and Jewish (Spaniol). Religions (1945): Moslem 98%; Christian 1%; Jewish 0.4%. Chief towns (pop., 1955 census): Ankara (cap.) 453,151; Istanbul 1,214,616; Izmir (Smyrna) 286,310; Adana 172,465; Bursa 131,336; Eskisehir 122,755. President of the republic in 1955, Celal Bayar; prime minister, Adnan Menderes.

History.—The sixth Turkish census carried out on Oct. 23, 1955, indicated that the population had increased by 3,175,254 since 1950 and by 10,463,508 since 1927. The yearly increase since 1950 was 30 per 1,000. Immigration (mainly Turks expelled from Bulgaria in 1951) accounted for about 150,000.

Home Politics.—The vast investments paving the way to prosperity had not created internal harmony and contentment in Turkey. One reason was the hardships created for those with limited incomes as a result of investments and inflation. A second was that civil servants could not adapt themselves quickly enough to the rhythm of the industrial age. Another was the merciless struggle between political parties. The premier's offer of co-operation with the opposition, made in a speech at Izmir (Feb. 15), for the purpose of "safeguarding the survival of democracy in Turkey," did not produce lasting effects.

The government's attitude toward the press had not been consistent; it made the former unpopular without restraining the latter. The government Democratic party also made the error of modifying the press law so that newspapers lost the right to prove their allegations about cabinet members arising out of the latter's official duties. This issue became a popular battle cry of the opposition, and 19 Democratic members signed motions against the official party view. The fourth Democratic convention had to concentrate on maintaining solidarity in its own ranks. The 19 members were expelled from the party and rejected not only the offer to return but also invitations to join one of the two opposition parties. They were busy forming a new Liberty party.

Meanwhile, the underground communist and other organizations took full advantage of the political unrest and economic discontent to prepare for the terrible riots in Istanbul and Izmir on the night of Sept. 6-7. Parliament was convoked and authorized the government to proclaim martial law for six months in Istanbul, Ankara and Izmir. The immediate pretext of the riots was to protest against the Greek attitude in the Cyprus question. The whole operation was a complete success. It was touched off by the planting of a bomb in a house in Salonika where Kemal Ataturk was born. This bomb did no damage, but a photograph showing the house destroyed appeared in the Istanbul press. The aims of the destruction and pillage achieved were to create a split between Turkey and the Christian world. Attacks—unprecedented for 500 years—against churches and cemeteries clearly indicated who had planned the riots. While order was re-established and those responsible were arrested in thousands, a committee of Turkish citizens started to collect donations and distribute them to the victims of the

riots. The Greek flag was rehoisted at Izmir by a member of the cabinet in order to offer a moral satisfaction to Greece.

Foreign Affairs.—Having failed to reach understanding with Egypt and other Arab countries and establish a prowestern security system in the middle east, Turkey turned its initiative in another direction. On Feb. 24, at Baghdad, a Turco-Iraqi defense treaty was signed. From Feb. 13 to March 13 Bayar, the president of Turkey, visited Pakistan. On April 14 Great Britain joined the Baghdad treaty. Pakistan signed it on Sept. 23 and Iran on Oct. 11 (following the visit of Bayar in September). A Middle Eastern Defense council with members of ministerial rank was formed at Baghdad on Nov. 22.

The president and premier of the Lebanese republic visited Turkey in April. Bayar returned the visit in June. In November Bayar returned a visit of the king of Jordan in 1954.

The Balkan alliance passed in 1955 through a serious crisis. The visit paid by Menderes to Rome (Jan. 30 to Feb. 3) to prepare for Italy's joining the Bled treaty (Aug. 9, 1954) failed because of Greek and Yugoslav objections. Menderes went to Yugoslavia (May 3-9) to ascertain its position toward the Balkan alliance on the eve of N. A. Bulganin's and N. S. Khrushchev's visit to Belgrade. The new relationship established between Moscow and Belgrade weakened the military importance of the Bled treaty, but the main blow to both the Balkan alliance and to the stability of the southern flank of the North Atlantic Treaty organization arose from the deterioration of Turkish-Greek relations as a result of the Greek claim of self-determination for Cyprus.

On the eve of the London conference Menderes stated that Cyprus, a Turkish possession for 350 years, given in trust to Great Britain to enable it to guarantee the security of Turkey, should revert to the original owners if the British should ever decide to retire from the island. He added that the Turks living there would never be allowed to fall under Greek domination after the sad experiences of the Turkish community in western Thrace. The London conference, which started on Aug. 29, fortified the British-Turkish position. On the last days of the conference, however, the riots in Istanbul and Izmir darkened the entire issue. (See CYPRUS; GREECE.)

Economic Affairs.—Foreign and Turkish critics claimed that it was impossible to continue the policy of industrialization at

TURKISH FARMER AND SON leading their sheep past the new Hilton hotel opened in Istanbul, Turk., in 1955

its present speed and that the country was facing bankruptcy. An attempt to obtain a loan of \$300,000,000 from the United States failed in June 1955. Meanwhile, long-term prospects for the future continued good: 17 foreign oil companies applied for 108 permits for drilling in certain areas at their own risk; a state refinery was completed to handle crude petroleum found at Raman. It would cover the fuel requirements of 19 out of 66 Turkish provinces and provide all material necessary for road surfacing. Rich wolfram deposits were found near Bursa and iron ore in various parts of the country. It was hoped that the new thermic and hydraulic power stations and the use at home of good quality soft coal would enable Turkey to become a hard coal exporter. (See also NORTH ATLANTIC TREATY ORGANIZATION.)

(A. E. Y.)

Education.—State schools (1954; private schools in parentheses): primary 17,928, including 2,220 three-year village schools (130), pupils 1,730,506 (19,011), teachers 33,250; junior high 465 (42), pupils 87,299 (8,700); secondary 79 (34), pupils 28,707 (4,071), teachers (including junior high) 6,291; vocational 190, pupils (1952–53) 38,500, excluding schools of agriculture, fine arts, hygiene and other professional schools which in 1951–52 numbered 28, with 4,400 pupils. Teachers' training schools 34, pupils 16,346, teachers 745. Institutions of higher education 16, students 24,700 (of which, 2 universities with 5,700 students.)

Finance and Banking.—Monetary unit: Turkish pound or lira, with an official rate of £T2.80 to the U.S. dollar. Budget (1955–56 est.): revenue £T3,091,266,397, expenditure £T3,091,262,815; total public debt (1953) £T2,304,000,000 of which at March 31, 1954, external debt was £T734,000,000. Currency circulation: (Dec. 1954) £T1,527,000,000. (June 1955) £T1,680,000,000. Bank deposits: total (Aug. 1954) £T2,486,000,000; (central bank only, Aug. 1954) £T419,000,000. (May 1955) £T557,000,000. Gold and foreign exchange: (Dec. 1954) U.S. \$205,000,000, (July 1955) U.S. \$216,000,000.

Foreign Trade.—(1954) Imports £T1,339,000,000, exports £T938,000,000. Main sources of imports: Germany 17%; France 7%; other continental European Payments union countries 15%; U.S. and Canada 15%; U.K. 9%. Main destinations of exports: Germany 18%; France 3%; other continental E.P.U. 16%; U.S. and Canada 18%; U.K. 7%. Main exports (1953): tobacco 22%; cotton 20%; wheat 15%.

Transport and Communications.—Roads (1953) 44,900 km. Motor vehicles in use (1953) cars 27,600, commercial vehicles 33,500. Railways (1954): 7,700 km.; passenger-km. 3,892,836,000; freight, ton-km. 3,647,000,000. Shipping (July 1954): merchant vessels of 100 gross tons and over 274; total tonnage 488,000. Air transport (state air lines, 1954): km. flown 3,372,000; passenger-km. 50,700,000; freight, ton-km. 1,308,000. Telephones (Jan. 1954): 113,609. Radio receiving sets (1954): 828,042.

Agriculture.—Main crops (metric tons, 1954, 1955 in parentheses): wheat 5,010,000 (6,530,000); barley 2,400,000; oats 325,000; maize 914,000; rye 470,000; potatoes 1,000,000; millet 88,000; tobacco 93,600 (107,500); cotton, lint 142,000; cottonseed 260,000; linseed 15,000; sunflower seed 120,000; sesame 48,000; soybeans 4,000; broad beans 37,000; chick-peas 75,000; lentils 64,000; hemp fibre 12,100; oranges and tangerines, etc., 111,000; lemons and limes, etc., 21,000; grapes 1,871,000; raisins (1952) 121,400; dry beans (1953) 112,000. Production (metric tons, 1954): beet sugar, raw 199,000; olive oil 50,000; wool 21,000; meat (1952): beef and veal 43,614 (including buffalo meat, 3,901), mutton and lamb 49,763, pork (1951) 110,000. Wine 7,488,000 l. Livestock: (Sept. 1954) cattle 10,759,000; (Sept. 1953) sheep 26,534,000, chickens 22,395,000, turkeys 1,301,000, horses 1,216,000, mules 117,000, asses 1,726,000, buffaloes 1,013,000.

Industry.—Fuel and power (metric tons, 1954): coal 5,610,956; lignite 2,086,572; crude oil 59,000; electricity 1,292,400,000 kw.hr. Raw materials (metric tons, 1954): iron ore (65% metal content) 476,628; pig iron 195,684; crude steel 168,888; copper, smelter 25,188; chrome ore 523,632; manganese (48%–50% metal content) 47,064; sulphur 10,020; salt (1953–54) 349,000. Manufactured goods (metric tons, 1954): cement 707,200; superphosphates 20,580; tobacco 26,268; cotton yarn (state factories only) 22,836, (private, 1952) 16,728; woven cotton fabric (state only) 131,988, (private, 1952) 65,724.

Twining, Nathan Farragut

(1897–), U.S. air force officer, was born at Monroe, Wis., on Oct. 11 and was graduated from the U.S. Military academy at West Point, N.Y., in 1919. Trained for the infantry, he later transferred to the U.S. air corps and studied at the corps's tactical school in 1935–36 and at the Command and General Staff school, Ft. Leavenworth, Kan., in 1936–37.

During World War II Twining served in the Pacific as com-

mander of the 18th air force in the Solomon Islands in 1943, in the Mediterranean area as commander of the 15th air force in Italy in 1944–45, and again in the Pacific in 1945 as commander of the 20th air force based in the Marianas.

In 1950, after serving as commander in chief of the Alaskan military defenses, Twining was appointed vice-chief of staff, U.S. air force, and was promoted to the rank of four-star general. In 1952 he became head of the strategic air command. In 1953 Pres. Dwight D. Eisenhower named him chief of staff, U.S. air force.

During 1954 and 1955 he repeatedly warned of the threat to the U.S. of the massive air power of the Soviet Union and Communist China. He asserted that nuclear weapons would be decisive instruments in any future conflict, and that the United States should use all weapons, including atomic ones, to retaliate against aggressors.

On May 25, 1955, Pres. Dwight D. Eisenhower named Twining to his second term as chief of staff of the air force.

Union of Soviet Socialist Republics.

This federation of soviet socialist republics is a state covering parts of eastern Europe and of northern and central Asia. Area: (1939) 8,173,557 sq.mi.; (1946) 8,598,678 sq.mi., including 1,969,110 sq.mi. (23%) in Europe. Pop.: (1939 census) 170,467,186; (1954 est.) 209,700,000, including 144,700,000 (69%) in Europe. Nationalities (1946): Russians about 51.3% of pop., Ukrainians 17.4%, Byelorussians 3.5%; no other nationalities (all non-Slavonic and most of them non-European) reached 3% of the total, the most important being the Turkic-speaking Uzbeks (2.85%). Religion: Russians, Ukrainians, Byelorussians and Moldavians (Rumanians) are Greek Orthodox; Lithuanians are Roman Catholic; Latvians, Estonians and Karelo-Finns are mainly Lutheran; Georgians have their own autocephalous Orthodox Church; Armenians are Christian; the indigenous inhabitants of Azerbaijan, the five central Asian soviet socialist republics and many autonomous republics (Tatar, Bashkir, Daghestan, etc.) are Moslem (number, 1939 est., 24,000,000); Buryats and Kalmyks are lamaist Buddhist. Chief towns (pop., 1948 est.): Moscow (cap.) 4,500,000; Leningrad 3,300,000; Kiev 900,000; Kharkov 900,000; Gorki 900,000; Baku 800,000; Novosibirsk 750,000; Kuybyshev 600,000; Sverdlovsk 600,000; Odessa 600,000; Tashkent 600,000; Tbilisi (Tiflis) 540,000; Rostov-on-Don 500,000; Dnepropetrovsk 500,000. First secretary of the Communist Party of the Soviet Union, N. S. Khrushchev (*q.v.*); chairman of the presidium of the supreme soviet of the U.S.S.R., Marshal K. E. Voroshilov; chairmen of the council of ministers in 1955: G. M. Malenkov and (from Feb. 8) N. A. Bulganin (*q.v.*).

History.—Both the domestic and the foreign policies of the Soviet regime reached during 1955 a turning point in their development since the death of J. V. Stalin in 1953. At home the change was symbolized by the replacement in February of G. M. Malenkov as premier by Marshal N. A. Bulganin. This was accompanied by the abandonment of the relatively moderate policy pursued by the government since Stalin's death and a reassertion of orthodox communist doctrines and objectives. In

"NEW KREMLIN OFFICIAL," a 1955 cartoon by Hesse of the St. Louis Globe-Democrat (Mo.)

foreign affairs the central event was the Geneva conference of the heads of the Big Four Powers, which was thought to mark the end of the "cold war" between east and west and the introduction of a new period of "peaceful coexistence." Before the end of the year, however, it was apparent that changes in the manner of Soviet diplomacy did not mean that it would be any less active in the pursuit of long-term communist ends.

Domestic Affairs.—Malenkov, who had succeeded Stalin in March 1953, submitted his resignation to the supreme soviet meeting on Feb. 8. The reasons he gave for his action (lack of administrative experience and his responsibility for the unsatisfactory state of agriculture) did not correspond with the known facts of his career. It seemed more probable that his removal was connected with the restatement of economic policy that took place at the same time. The production of consumer goods, upon which Malenkov had laid great stress, was declared to be secondary to the continued rapid expansion of heavy industry. This was the policy proclaimed by Bulganin, who became premier. Malenkov remained a deputy premier and a member of the party presidium and was made minister for electric power stations.

The principle of collective responsibility for the leadership of the country was maintained and stressed throughout the year. The supreme policy-making body, the presidium of the party central committee, was increased in size from 9 to 11 members by the addition in July of A. I. Kirichenko, the first secretary of the Ukrainian Communist party, and M. A. Suslov, a member of the secretariat of the Communist Party of the Soviet Union (C.P.S.U.). The number of secretaries of the central committee was increased to five by the addition of A. B. Aristov, N. I. Belyayev and D. T. Shepilov. N. M. Shvernik, for some time chairman of the presidium of the supreme soviet and latterly chairman of the Profsoyuz or All-Union Central Council of Trade Unions, was not seen in public for the greater part of the year. P. K. Ponomarenko was appointed ambassador in Poland. Both these men appeared to have lost their places on

the presidium. N. N. Shatalin, formerly a secretary of the central committee, disappeared altogether.

Changes also took place in the composition of the council of ministers and its presidium, or cabinet. The number of first deputy premiers, who, with the premier, comprise the presidium, was increased from two (V. M. Molotov and L. M. Kaganovich) to five by the promotion of A. I. Mikoyan, M. G. Perukhin and M. Z. Saburov. The number of plain deputy premiers was increased from four to eight.

Despite the emphasis on collectivity, Bulganin, as head of the government, and N. S. Khrushchev, as first secretary of the C.P.S.U., received noticeably greater publicity than their colleagues. They went, as the highest representatives of the Soviet state, on several missions together. Molotov was obliged to indulge in some ideological "self-criticism" in October, but continued to act as the regime's chief diplomatist and spokesman on foreign affairs.

The most important policy statements were those made at the session of the supreme soviet held in February and at the January and July plenary meetings of the central committee. The supreme soviet session was preceded by a serious dispute inside the party about the relative importance to be attached to heavy industry on the one hand and consumer goods industries on the other. Bulganin declared that previous excessive emphasis on light industry had been mistaken and that the government would continue to expand the capital goods industry at a greater speed than the rest of the economy. This remained the central theme of internal propaganda throughout the year.

The failure of agricultural production to keep pace with the demands of an increasing population continued to preoccupy the authorities. The January party plenary meeting was called to deal with the slow progress in grain and livestock production and called for a substantial increase in the efficiency of the older grain-producing farms, the reclamation by 1956 of a total of 75,000,000 ac. of virgin and neglected land, the increase of the total grain harvest to 160,000,000 tons in five or six years (as compared with the original aim of 186,700,000 tons planned for 1955) and the extension of the area under maize (corn) to 70,000,000 ac. by 1960. Khrushchev emerged as the leading advocate of the cultivation of maize as a means of solving the country's food problems. The July plenary meeting recorded some progress along the lines laid down in January. But unfavourable weather conditions militated against a good harvest, and there was evidence in the autumn that the government was far from satisfied with the results of the year's efforts.

Union of Soviet Socialist Republics

Republic	Capital	Area (sq.mi.)	Population (1954 est.)
Russian S.F.S.R.	Moscow	6,523,524*	119,700,000

In July Bulganin directed the party's attention to the urgent necessity for increasing the general efficiency of Soviet industry. In a report to the central committee he criticized the workings of individual plants, whole industries and the planning of the

industrial economy as a whole. He compared it unfavourably with the working of "capitalist" industry, and declared that, unless steps were taken to increase the productivity of labour, the country would be confronted with a serious manpower shortage. Among the measures taken to remedy the situation was the appointment of L. M. Kaganovich, the country's leading industrial administrator, to head a new government committee on labour and wages. V. A. Malyshev, a deputy premier, was put in charge of a similar committee dealing with the introduction of "new technology." In May the central economic planning body, Gosplan, was divided into two sections, one for long- and the other for short-term planning. Several delegations of industrial experts visited western Europe and the United States to study production methods. During the year it was announced that the fifth five-year plan had been completed in four years and three months and that the directives for the sixth plan would be announced at the party congress in Feb. 1956.

In September the presidium of the supreme soviet announced an amnesty for Soviet citizens who "either through lack of courage or through ignorance collaborated with the occupying forces" during World War II. The amnesty also applied to Soviet citizens still living abroad who had served in the German armed forces during the war. They were invited to return to the U.S.S.R. The repatriation campaign was intensified during the year and assisted by a new radio station which was concerned only with making appeals in this direction.

The general political atmosphere in the Soviet Union remained comparatively relaxed and there was no resumption of active police terror. Appeals to respect "socialist legality" were frequent and indicated that the disciplinary agencies in the state were being restrained. Propaganda against drunkenness and various forms of immorality was intensified. The congress of Soviet writers, which took place at the end of 1954, was notable for the reassertion of the party's ideological control over the arts, and there was no evidence during 1955 that this control had been reduced.

Armed Forces.—With Bulganin's appointment as premier his place as minister of defense was taken by Marshal G. K. Zhukov, the country's leading professional soldier. This was followed in March by the appointment of six new marshals of the Soviet Union (the highest military rank), thus raising the total number to 17. Two new air marshals and two marshals of artillery were also appointed. A number of changes made in the commands of military districts indicated that a thoroughgoing reorganization of the general staff took place during the year. Marshal Zhukov was a member of the Soviet delegation to the Geneva conference in July. Marshal I. S. Koniev was appointed in May to command the military forces of the new eastern European treaty organization.

The 1955 budget revealed an increase in the admitted military allotments from 17.8% to 19.8% of total expenditure. Government and military leaders frequently claimed that the Soviet armed forces were equipped with the most up-to-date weapons. The annual air display in July provided evidence that advanced types of intercontinental bombers and supersonic fighters were already in production.

In August the government announced its decision to reduce the total size of the armed forces by 640,000 men before the end of the year. This gesture was widely advertised as evidence of the Soviet government's peaceful intentions and was copied by the satellite governments. It appeared, however, to reflect primarily an increasingly urgent demand for manpower in farming and industry.

In January the Soviet government announced that it was ready to assist the governments of eastern Europe in the construction of plants for the generation of electric power by atomic

means. It depicted itself as the principal champion of the peaceful uses of atomic energy and took part in the conference devoted to that subject which was held in Geneva in August. In March the government allowed it to be known that Bruno Pontecorvo, the atomic physicist of British nationality who disappeared in 1950, was in Moscow and allowed him to meet foreign correspondents.

Foreign Affairs.—During the first half of the year the Soviet government concentrated on making and advertising a number of inexpensive concessions in foreign affairs which were calculated to convince the western powers of the sincerity of the Soviet desire to live at peace with the rest of the world. Among such "concessions" were the agreement to sign the Austrian peace treaty and the restoration of normal relations with Yugoslavia. These moves made possible the holding in July of the conference of the heads of the Big Four Powers in Geneva, at which the Soviet leaders—Bulganin, Khrushchev, Molotov and Zhukov—entered into direct negotiations with the leaders of the western world for the first time since World War II. Though the meeting produced no agreement on major international problems, it was noted that the Soviet Union had abandoned the more abusive forms of antiwestern propaganda. Such reassurance as had been afforded by Geneva was largely destroyed, however, by continued Soviet intransigence on the question of German unity and later by the government's direct intervention in middle eastern affairs.

The reunification of Germany remained the central problem. In the early months of 1955 the Soviet government campaigned vigorously for the nonratification of the London and Paris agreements to bring the German Federal Republic into the North Atlantic Treaty organization. When this failed Moscow summoned a conference in Warsaw of the seven communist countries of Europe (which had already had a preliminary meeting in Moscow in Nov. 1954), concluded with them a mutual aid defense treaty and set up a joint military command with headquarters in Moscow. Following the failure of the Geneva conference to make progress on the German question, the Soviet government entertained delegations from western and eastern Germany in Moscow. It reasserted its support for the eastern German communist regime and persuaded the western German government to enter into diplomatic relations with itself in exchange for the release of German prisoners of war still in Russian hands. It remained Soviet policy to emphasize the existence of two separate German states which alone could bring about German unity.

The conclusion of the Warsaw treaty on May 14 was an indication of the firmer grip exerted by the Soviet government over the satellite countries. Economic integration proceeded apace. The acceptance at Geneva of Bulganin's refusal to permit any discussion of the status of the political regimes in eastern Europe appeared also as acceptance of Soviet domination of that area.

Outside the area of its direct influence it appeared to be the Soviet government's desire to create a group of neutral states not unfriendly toward the U.S.S.R. and not directly involved in western organizations. Thus the conclusion of the Austrian treaty was made conditional on a declaration of permanent neutrality on the Swiss pattern. Great pressure was exerted on Finland, whose president visited Moscow in September, to strengthen its ties with the U.S.S.R., though remaining non-communist. The restoration of normal relations with Marshal Tito's regime in Yugoslavia, which was brought about during a visit to Belgrade by Bulganin and Khrushchev in May, was not accompanied by efforts to return Yugoslavia to satellite status. During the official visits to Moscow of the Indian prime minister, Jawaharlal Nehru, in June and the Burmese prime minister, U Nu, in October, the Soviet leaders stressed their willing-

ness to maintain friendly relations with political systems different from their own.

Great efforts were made to extend contacts with noncommunist countries through their parliaments. Among the parliamentary delegations which visited were those from India, Sweden, France, Syria, Yugoslavia, Belgium, Japan and Luxembourg. In June members of the supreme soviets of the U.S.S.R., the Ukraine and Byelorussia decided to form parliamentary groups and join the Inter-Parliamentary union, whose annual conference they attended. The Soviet Union began to play a larger part in various international organizations, such as the International Labour organization and the various UN specialized agencies, which it had boycotted in the past.

The restoration of friendly relations with the United States was followed by an exchange of official agricultural delegations in July. The U.S. visitors were allowed to inspect Soviet farming methods more closely than ever before, and their outspoken comments and criticisms were well received. Delegations were also exchanged with Great Britain, and there was an appreciable increase in the number of sporting and cultural exchanges.

Soviet relations with Communist China remained unchanged and outwardly very friendly. Talks were started for the resumption of normal relations with Japan, but made little progress. On April 16 the Soviet ministry of foreign affairs issued a special and unexpected statement on the situation in the middle east. It protested against steps being taken to involve countries of this area in western defense arrangements and said that the Soviet government could not remain indifferent to the situation arising, which, it said, had "a direct bearing on the security of the U.S.S.R." It called upon the middle eastern countries not to enter military blocs and promised that it would be favourably disposed toward any government which took steps to preserve its independence. This statement, which was not evoked by any particular event, was taken as a formal announcement of Soviet intentions to intervene directly in the affairs of the middle east.

With Iran the government reached agreement on outstanding financial problems and extended an invitation to the shah to visit the U.S.S.R. In July D. T. Shepilov, chief editor of *Pravda* and secretary of the C.P.S.U., visited Cairo. In August an invitation was extended to the Egyptian premier, Lieut. Col. Gamal Abdel Nasser, to visit Moscow. At the beginning of October Nasser announced that he had reached agreement with the Soviet and Czechoslovak governments for the supply of arms to Egypt. Along with this increased political interest in the middle east and Asia went offers to extend commercial relations. During 1955 the Soviet government took part in 17 international trade fairs.

Molotov, the foreign minister, led the Soviet delegation to the second Geneva conference (*q.v.*) and maintained his government's obdurate stand on the German question. (See also ANT-ARCTICA; ATOMIC ENERGY; COMMUNISM; EASTERN EUROPEAN ECONOMIC PLANNING; RUSSIAN LITERATURE; UNITED NATIONS.)

(D. FD.)

Education.—Schools (1954–55 official estimates): nursery, pupils 7,000,000; primary 200,000, pupils 29,000,000; secondary 23,000, pupils 10,000,000; vocational, pupils 8,700,000; adult education, pupils 2,000,000; universities 31, institutions of higher education 856, students 1,800,000, including 600,000 taking correspondence courses.

Finance.—Budget: (1954 estimates) revenue 572,542,327,000 roubles, expenditure 562,801,956,000 roubles; (1955 estimates) revenue 590,192,622,000 roubles, expenditure 563,482,491,000 roubles. Investments from the state budget in the national economy in 1954 amounted to 216,359,950,000 roubles and, in addition, from the enterprises' and economic organizations' own funds, 110,349,000,000 roubles. In 1955 the respective figures were 222,349,364,000 roubles and 112,886,280,000 roubles. External value of the rouble, high and fictitious: U.S. \$1 = 4 roubles.

Foreign Trade.—(In U.S. dollars; percentage of world trade in parentheses.) Imports (1950) \$1,049,000,000 (1.8%); exports (1950) \$1,141,000,000 (1.9%). In 1953 the total Soviet foreign trade, imports and exports together, was estimated at \$5,750,000,000. Main sources of imports

(1950): European people's democracies (Bulgaria, Czechoslovakia, Hungary, Poland and Rumania) 60.6%; eastern and western Germany 14.5%; United Kingdom 3%; United States 0.09%. Main destinations of exports (1950): European people's democracies 71.3%; Germany 8.3%; United Kingdom 7.5%; United States 3.5%. Soviet trade with 17 western European countries (1953, in U.S. dollars): exports \$331,100,000; imports \$311,300,000.

Transport and Communications.—Railways (1954): 117,000 km.; rail transport accounted for 83% of all goods traffic. Shipping (July 1954): vessels of 100 gross tons and over 1,113; gross tonnage 2,381,000. Motor vehicles in use (1953 estimate): cars 300,000; commercial 2,200,000. Telephones (1936, last figure published): 861,200.

Agriculture.—Main crops (metric tons, 1950; latest estimates or plan in parentheses): grain 124,700,000 (1954: 135,000,000); sugar beets 24,300,000 (1955 plan: 40,000,000); potatoes (1940) 84,200,000 (1955 plan: 147,800,000); cotton, unginned 3,800,000 (1955 plan: 6,300,000). The figures given for Soviet crops did not represent the actual amount harvested but a "biological" estimate determined in the field prior to harvest. Livestock (1953; 1956 plan in parentheses): cattle 56,600,000 (68,600,000); pigs 28,500,000 (36,200,000); sheep and goats 109,600,000 (160,400,000); horses 15,300,000.

Industry.—Heavy industry production (metric tons except as noted; 1955 estimates based on speeches by N. A. Bulganin of July 4, 1955, and of L. M. Kaganovich of Nov. 6, 1955): coal (including lignite) 390,000,000; crude petroleum 70,000,000; electricity 166,200,000,000 kw.hr.; pig iron 33,000,000; steel 45,000,000; cement 22,900,000. Textile and footwear production (1954 estimates): cotton fabrics 5,480,000,000 m.; woollen fabrics 242,000,000 m.; silk fabrics 520,000,000 m.; leather shoes (1950) 205,000,000 pairs. Foodstuffs production (metric tons except as noted, 1950; 1955 plan in parentheses): meat 1,275,000 (2,550,000); fish, catch, 1,778,000 (3,190,000); butter, dairy produced, 325,000 (560,000); cheese, dairy produced, 48,000 (135,000); vegetable oil 775,000 (1,500,000); margarine 195,000 (450,000); sugar 2,515,000 (4,800,000); beer 12,800,000 (23,200,000) hl.; wine 1,430,000 (3,448,000) hl.

Unitarian Church.

During 1955 churches and fellowships reported to the American Unitarian association a total of 96,700 members, a 4.3% increase over the previous year. The first biennial conference of the Council of Liberal Churches (Universalist-Unitarian) was held in Detroit, Mich., Aug. 24–29. The delegates voted, pending ratification by the annual meeting of the American Unitarian association in May 1956, to set up a commission to present plans for merger or alternative relationships to be submitted to a plebiscite of the denominations.

The 130th annual meeting of the American Unitarian association, held in Boston, Mass., in May 1955, passed resolutions urging the churches to work for racial integration and to oppose evasion of the supreme court decision against segregation in the schools; condemning censorship and protesting injustices in the federal security program and in the Selective Service act which had been interpreted to demand religious professions for registration as a conscientious objector; calling for protection of lands held in the public domain; asking for fair treatment by the government of American Indians; requesting adequate support for work in mental health; and calling for continued and increased backing for the United Nations. A Committee to Study the Whole Matter of Resolutions reported (and its recommendations were adopted) that "The present climate of public opinion adverse to free speech, heretical views and diversity of opinion" makes it important "to permit controversial resolutions to be presented to the Annual Meeting. To abandon the practice now, could be interpreted as a move of caution and expediency." The committee asked that resolutions be limited to "those with a clearly substantial ethical, moral or religious content" but pointed out that Unitarians as a whole believe that "religion affects our daily life," and that work for the kingdom of God requires action in "the field of public affairs."

(J. H. L.)

United Church of Canada.

The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches in Canada, reported for 1954 a membership of 894,556, which represented an increase over 1953 of 24,655 and an increase of 294,034 since 1925. There were, in 1955, 6,222 preaching places and 2,200,543 persons under pastoral oversight. The Sunday school enrolment

was 636,664 in 5,257 schools. There were three universities, eight theological colleges and eight secondary schools, and a total of 592 candidates preparing for the ministry. During the year, 93 graduates were ordained.

The church owned \$227,195,352 worth of property. Givings to the missionary and maintenance fund were \$4,248,641 during 1954, an increase of \$415,699. Total givings for all purposes were \$36,735,641, an increase of \$3,267,999.

The church appointed 17 missionaries to the overseas work in 1954, to implement the workers in Angola, West Africa, Northern Rhodesia, India, Japan, Korea and Trinidad.

Projects completed during the year included a new training school for women workers, the financial campaign for which was carried through by the church women; two new homes for senior citizens, making a total of 12 such institutions; a complete revision of the Sunday school curriculum from nursery school to adult classes; and a new missionary boat for the west coast fleet. In the period 1948-54, 200 new churches and halls had been built, as well as 90 manses. New work was started in city suburbs and mining areas such as Manitowaning, Ont., and Chibougamau, Que., following the trend in population, and also in the Yukon, when work abandoned years before was reactivated because of the influx of people to the area.

The general council reorganized the administration of the church with a new department, information and stewardship, made up largely of representatives selected from various church boards. It also launched a four-year National Evangelistic campaign, two years to be given to preparation and rededication and two years to winning nonchurch members to the religion of Jesus Christ. United Nations. When the members of the United Nations assembled in San Francisco, Calif., on June 20, 1955, to celebrate the tenth anniversary of the signing of the charter, they could do so with the knowledge that the organization had not only survived ten years of trial but also had made substantial contributions to the peace, security and welfare of the world and was currently recognized as having an important role to play in international relations.

Membership and Representation.—The deadlock over the admission of new members into the United Nations which had existed since 1950 was broken in 1955 when 16 countries were voted in by the general assembly. Up to this time the membership had consisted as follows: Afghanistan, Argentina, Australia, Belgium, Bolivia, Brazil, Burma, the Byelorussian Soviet Socialist Republic, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, the Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, Iceland, India, Indonesia, Iran, Iraq, Israel, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Pakistan, Panamá, Paraguay, Peru, the Republic of the Philippines, Poland, Saudi Arabia, Sweden, Syria, Thailand, Turkey, the Ukrainian Soviet Socialist Republic, the Union of South Africa, the Union of Soviet Socialist Republics, the United Kingdom, the United States of America, Uruguay, Venezuela, Yemen and Yugoslavia.

On Dec. 13 a resolution was presented to the Security council that called for the admission of 18 countries: Albania, Austria, Bulgaria, Cambodia, Ceylon, Finland, Hungary, Republic of Ireland, Italy, Japan, Jordan, Laos, Libya, Nepal, People's Republic of Mongolia, Portugal, Rumania and Spain. The delegate from Nationalist China proposed the addition to these of

TENTH ANNIVERSARY ASSEMBLY of the United Nations listening to an address by U.S. Secretary of State John Foster Dulles at San Francisco, Calif., in June 1955

the South Korean and South Vietnam republics. The delegate from the U.S.S.R. vetoed the latter two, whereupon the delegate from Nationalist China vetoed the People's Republic of Mongolia, and the Soviet delegate then vetoed Austria, Cambodia, Ceylon, Finland, Ireland, Italy, Japan, Jordan, Laos, Libya, Nepal, Portugal and Spain. The remaining four, Albania, Bulgaria, Hungary and Rumania, were then defeated by a vote of the Security council. Thus it seemed that the stalemate would be maintained.

However, the next day the Soviet delegate announced that his government would agree to a revised list which would omit the People's Republic of Mongolia and Japan, and on Dec. 14 the general assembly voted to approve the admission of the 16 new countries. Thus, Albania, Austria, Bulgaria, Cambodia, Ceylon, Finland, Hungary, Republic of Ireland, Italy, Jordan, Laos, Libya, Nepal, Portugal, Rumania and Spain became the newest members.

No change occurred during 1955 in the representation of China in the organs of the UN. Though a number of members, including the U.S.S.R. and India, argued in the tenth general assembly that the Chinese Nationalist government on Formosa was not representative of the Chinese people and that the exclusion of representatives of the People's Republic of China seriously handicapped the UN in its work, the assembly voted to postpone any consideration of the Soviet proposal to accept representatives of the People's republic as representing China.

Organization and Meetings.—The ninth session of the general assembly which had convened on Sept. 21, 1954, adjourned on Dec. 17. The tenth session opened on Sept. 20, 1955. José Maza of Chile was elected president. The assembly had on its agenda a number of items of major importance, including the peaceful use of atomic energy, the regulation of armaments, the holding of a charter review conference, a variety of colonial

problems, proposals for promoting economic development, the technical assistance program and questions of human rights and race conflict.

Beginning Jan. 1, 1955, the Security council was composed of five permanent members (China, France, the U.S.S.R., the United Kingdom and the United States) and six nonpermanent members (Belgium, Brazil, Iran, New Zealand, Peru and Turkey). The tenth general assembly elected Cuba and Australia to take the places of Brazil and New Zealand respectively for two-year terms beginning Jan. 1, 1956, but became deadlocked in its efforts to select a replacement for Turkey. The U.S.S.R. and other members argued that on the basis of an understanding going back to 1946, eastern Europe was entitled to a representative on the council and gave their support to Poland. Subsequently Yugoslavia was put forward as a possible compromise candidate. The United States, with the backing of the Latin-American republics and a number of the Asian-African members, and denying the binding force of any such understanding, supported the Philippines.

The Economic and Social council, which had met for the first part of the 18th session in Geneva, Switz., from June 29 to Aug. 6, 1954, resumed its session in New York city in November and December. The 19th session was held in New York from March 29 to April 7, 1955, and from May 16 to 27. The main part of the 20th session was held in Geneva from July 5 to Aug. 5; a few concluding meetings were to be held during or after the tenth session of the general assembly. The membership of the council during the calendar year 1955 was as follows: with terms ending Dec. 31, 1955—Australia, India, Turkey, the United States, Venezuela and Yugoslavia; with terms ending Dec. 31, 1956—Czechoslovakia, Ecuador, Norway, Pakistan, the U.S.S.R. and the United Kingdom; with terms ending Dec. 31, 1957—Argentina, China, Dominican Republic, Egypt, France and the Netherlands. The tenth general assembly elected the United States, Canada, Indonesia, Yugoslavia, Brazil and Greece for two-year terms ending Dec. 31, 1958.

The Trusteeship council held its 15th session from Jan. 25 to March 28, 1955, and its 16th session from June 8 to July 22. During the calendar year 1955 the Trusteeship council had the following composition: members administering trust territories—Australia, Belgium, France, New Zealand, the United Kingdom and the United States; members by virtue of permanent membership in the Security council—China and the U.S.S.R.; members elected by the general assembly—El Salvador and Syria until Dec. 31, 1955, and India and Haiti until Dec. 31, 1956. Italy continued to participate in a nonvoting capacity in council discussion of Italian administration of Somaliland. The tenth general assembly in October elected Guatemala to take the place of El Salvador and re-elected Syria for three-year terms ending Dec. 31, 1958.

The composition of the International Court of Justice had been changed as the result of elections held on Oct. 7, 1954. Sir Mohammed Zafrulla Khan (Pakistan) was elected to fill the unexpired term of Sir Benegal N. Rau (India) and took office immediately. Judges J. G. Guerrero (El Salvador) and J. Basdevant (France) were re-elected for nine-year terms beginning Feb. 6, 1955. H. Lauterpacht (United Kingdom), L. M. Moreno Quintana (Argentina) and R. Córdova (Mexico) were elected for nine-year terms to succeed Judges Sir Arnold McNair, A. Alvarez and Levi Carneiro. Other judges of the court were Green H. Hackworth (U.S.), Abdel Hamid Badawi (Egypt), B. Winarski (Poland), M. Zoricic (Yugoslavia), H. Klaestad (Norway), J. E. Read (Canada), Hsu Mo (China), E. C. Armand-Ugon (Uruguay) and F. I. Kojevnikov (Soviet Union). The court sat at The Hague from Feb. 3 to April 6, and from May 9 to June 7. It elected Judge Hackworth as president and Judge

Badawi as vice-president, disposed of various administrative and procedural matters and gave one judgment (Nottebohm case) and one advisory opinion (territory of South-West Africa).

Administration and Finance.—The total appropriation for the activities of the UN for the fiscal year 1954 was \$48,528,980, and total expenditure was \$48,510,009. For the year 1955, the general assembly approved an expenditure of \$46,963,800. The secretary-general's estimate of expenditures for 1956 was \$46,278,000. Taking into account estimated miscellaneous income of \$6,873,600, the estimated net expenditures for 1956 of \$39,404,400 represented the lowest budget request submitted by the secretary-general since 1950. A saving of about \$2,000,000 in 1955 came largely from reduced headquarters expenses resulting from the carrying out of the secretary-general's administrative reorganization plan, which it was expected to complete in 1956. Assessments for 1955 were made on the basis of the scale of assessments approved by the general assembly by its resolution of Dec. 4, 1954. This resolution also authorized the secretary-general to accept a portion of the contributions in currencies other than U.S. dollars. Members were informed that 20.40% of their contributions could be paid in Swiss francs and 13.95% in other non-U.S. dollar currencies. The Committee on Contributions in its 1955 report to the general assembly recommended some revision of the scale of assessments for 1956, 1957 and 1958. The most notable change recommended was an increase of 0.20% in the contribution of the U.S.S.R.

The general assembly by resolution of Dec. 17, 1954, took note of the advisory opinion given by the International Court of Justice on July 13 on the legal effect of awards of compensation made by the administrative tribunal, and established as of Jan. 1, 1955, a special indemnity fund for the payment to staff members of awards of compensation made by the tribunal in accordance with its statute. In accordance with the resolution, the fund was duly established and awards of \$179,420 which the tribunal had made in the cases of the 11 UN employees of United States nationality who were dismissed following invocation of the fifth amendment were paid. By the same resolution the general assembly accepted in principle judicial review of judgments of the tribunal. A special committee of 18 was created to study the question and report. In its report to the tenth general assembly, adopted by a vote of 9 to 4 with 4 abstentions, the committee recommended the creation of a committee composed of states members of the General committee of the assembly to consider applications for the review of awards, and if it should decide that a substantial basis existed, to request the International Court of Justice to give an advisory opinion which would be conclusive. The assembly approved the recommendation substantially as presented.

Political Problems.—Disarmament.—The ninth general assembly by its resolution of Nov. 4, 1954, had unanimously agreed in principle to the conclusion of a convention providing for the regulation, limitation and major reduction of all armed forces and conventional armaments, the total prohibition of the use and manufacture of nuclear weapons and weapons of mass destruction, together with the conversion of existing stocks for peaceful purposes and the establishment of control organs adequate to guarantee effective observance. The Disarmament commission was asked to seek an acceptable detailed solution of the problem. The commission's subcommittee (Canada, France, the U.S.S.R., the U.K. and the U.S.) was to be reconvened.

The subcommittee met in London from Feb. 25 to May 18, 1955. Detailed proposals were submitted in the course of these discussions by the four western powers and the U.S.S.R. The U.S.S.R. on May 10 submitted a detailed proposal calling for the implementation of the agreed principles by stages. Within one month, China, France, the United Kingdom, the U.S.S.R.

and the U.S. were to furnish the Disarmament commission with full official figures regarding armed forces, conventional armaments and military expenditures. The armed forces of the five were to be reduced to specified levels, 50% of this reduction to take place within the first year. With the initiation of measures of reduction, states were to pledge themselves not to use nuclear weapons for aggressive purposes. They were also to pledge themselves to liquidate military, naval and air bases in foreign countries. International control organs were to be established with power to establish control posts on national territories, to require states to give necessary information on performance and to have unimpeded access to records relating to appropriations. Immediately after the lapse of a year, the production of atomic and hydrogen weapons was to be discontinued, and during the second year the remaining 50% reduction of armed forces and conventional weapons was to be carried out. After completion of one-half of this reduction, complete prohibition of use of atomic, hydrogen and other weapons of mass destruction was to become effective. During the second year, the liquidation of foreign military, naval and air bases would be completed.

The principal point of disagreement between the western powers and the U.S.S.R., which proved to be insuperable, was the question of control. The position of the western powers was that measures of reduction, and more particularly the prohibition of the manufacture and use of atomic and hydrogen weapons, should be taken after an effective control organ had been constituted. The western powers insisted that the control organ should have detailed and explicit powers for supervising and guaranteeing observance of all provisions of the proposed convention, including the right to station officials in national territories who would have the right of unrestricted access to, egress from and travel within these territories, and access to all installations and facilities. The control organ would be authorized to report to the Security council, the general assembly and signatories on violations, and to make recommendations.

At the Geneva conference of the heads of the Big Four Powers in July, Pres. Dwight D. Eisenhower proposed that the United States and the U.S.S.R. as a first step agree to give each other complete blueprints of their military establishments and to provide facilities for complete aerial reconnaissance. Premier N. Bulganin proposed that pending the conclusion of a disarmament convention, the major powers undertake not to use atomic and hydrogen weapons against any state. It was agreed at Geneva that the subcommittee of the Disarmament commission be reconvened to take into account the proposals of the heads of governments and that the foreign ministers of the four states meet in October to consider disarmament as one item of their agenda.

The subcommittee reconvened on Aug. 29 in private meetings but no substantial progress in resolving differences was reported. When the general assembly met on Sept. 20 the disarmament question was included on its agenda and received much attention in the general debate. Considering that the foreign ministers of the major powers would be discussing the disarmament problem at their Geneva meeting beginning Oct. 27, the Political committee of the general assembly voted to postpone debate on the question.

Peaceful Use of Atomic Energy.—President Eisenhower proposed to the general assembly on Dec. 8, 1953, that an international atomic energy agency be established under the aegis of the United Nations to further the use of fissionable material "to serve the peaceful pursuits of mankind." The ninth general assembly unanimously voted endorsement of the president's program on Dec. 4, 1954, expressing the hope that the proposed International Atomic Energy agency would be established without delay. Participation of the U.S.S.R. in the proposed agency

was in doubt in view of differences between the U.S. and the U.S.S.R. over the composition and powers of the agency and its relation to the UN. Following the adoption of the general assembly resolution, the eight states—Australia, Belgium, Canada, France, Portugal, the Union of South Africa, the U.K. and the U.S.—which had been conferring on the establishment of the agency renewed their discussions. A draft statute was prepared which was generally acceptable to them. This was given to the U.S.S.R. in late July, and somewhat later was circulated to other members of the UN and the specialized agencies. It provided for an autonomous agency with suitable powers to direct and supervise the use of fissionable materials placed at its disposal for peaceful purposes, which would be open to members of the UN and the specialized agencies and to other states able and willing to carry out the obligations of membership. The relationship of the agency to the UN would be defined by a special agreement. The U.S.S.R. objected to certain features of the draft, arguing in particular for a wider membership, for the prohibition of the use of atomic energy for war purposes and for a closer relationship of the proposed agency to the UN. On Oct. 27 the Political committee of the assembly unanimously approved a proposal which noted with satisfaction the progress toward the negotiation of a draft statute, welcomed the extension of invitations to Brazil, Czechoslovakia, India and the U.S.S.R. to participate with the eight sponsoring states in negotiations on the above statute and requested the secretary-general to make a study of the question of the relationship of the proposed agency to the United Nations for transmittal to the negotiating governments.

The general assembly resolution of Dec. 4, 1954, also called for the holding of an international technical conference under the auspices of the United Nations to explore means of developing the peaceful uses of atomic energy. The conference met in Geneva Aug. 8 to 20, under the presidency of Homi J. Bhabha of India. Scientists from 60 members of the UN and 24 other states members of specialized agencies submitted 1,100 papers of which 442 were orally delivered and translated into the four conference languages. A special report on the conference together with proposals for further action was submitted by the secretary-general to the general assembly. The draft resolution approved by the assembly's Political committee on Oct. 27 recommended that a second conference be held.

Korea.—The question of Korean unification was considered at the Geneva conference in the spring of 1954 but without agreement being reached. On Nov. 11, 1954, the 15 members which had participated in collective military action in Korea and in the Geneva conference reported to the United Nations assembly on the proceedings of that conference. They stated that they had been guided at the conference by two main principles: (1) that the UN was fully justified in taking collective measures in Korea and in extending its good offices to seek a peaceful settlement; and (2) that in order to establish a unified, independent and democratic Korea, free elections under UN supervision for representation proportional to population were essential. The general assembly on Dec. 11 adopted a resolution approving the report and reaffirming the objectives of UN action. The Korean question was again on the agenda of the general assembly at its tenth session with little prospect of any progress being made.

The Republic of Korea demanded the abolition of the Neutral Nations Supervisory commission set up under the terms of the armistice agreement to check observance of the terms of the agreement. The Swedish and Swiss governments proposed in Jan. 1955 the abolition or reduction in size of the commission because of its ineffectiveness. The United States government favoured abolition but the Central People's government of the

People's Republic of China insisted on its continuance though agreeing to a reduced staff.

China.—On Dec. 4, 1954, the U.S. requested the general assembly to consider a complaint of detention and imprisonment of UN military personnel by Communist China in violation of the Korean armistice agreement. The assembly, by resolution of Dec. 10, condemned the detention and instructed the secretary-general to seek their release. Following an exchange of telegrams and conversations with the Communist Chinese minister in Stockholm, the secretary-general went to Peking where he had conversations with Foreign Minister Chou En-lai from Jan. 5 to 10. After extended discussions and negotiations involving, among others, the secretary-general, the U.S., the People's Republic of China and India, 11 U.S. airmen were released on Aug. 4.

Questions Involving National Independence and Self-Determination.—A resolution adopted by the general assembly on Dec. 17, 1954, expressed confidence that a satisfactory solution would be achieved regarding the Moroccan question. When, however, there was an outbreak of violence in Morocco instigated by nationalist forces in the summer of 1955, 15 Asian-African members requested the secretary-general on July 20 to use his good offices to end the violence and 14 of them asked that the question be placed on the agenda of the tenth general assembly.

The Algerian question was submitted to the general assembly for the first time in 1955. The Asian-Arab states making the submission contended that violence in Algiers was a potential threat to peace and a source of international friction. When the general assembly met for its tenth session, the General committee recommended against inclusion of the Algerian question on the assembly's agenda. The general assembly, however, by a vote of 28 to 27, with 5 abstentions, decided to include the item. The French delegation withdrew in protest after arguing that since Algiers was a part of metropolitan France the question was clearly outside the assembly's competence. The Political committee, however, decided to postpone debate.

Following a request from the Greek government, the ninth general assembly decided to place on its agenda the dispute between Greece and the U.K. over self-determination for Cyprus. The assembly decided, however, that it was not appropriate for the time being to adopt a resolution dealing with the question. On July 23 Greece again requested that the question be placed on the agenda of the assembly. The general assembly this time upheld the recommendation of its General committee that the item not be inscribed on its agenda.

Palestine.—The Palestine question continued to be a major concern of the United Nations during 1955. The Security council was called upon to deal with disputes and outbreaks of violence between Egypt and Israel giving rise to charges of violation of the armistice agreement. The general assembly and its subsidiary organs continued to deal with the Arab refugee problem, with little progress toward a solution.

On Sept. 28, 1954, the Egyptian authorities seized an Israeli ship, the "Bat Galim," in the approaches to the Suez canal. The Israeli government claimed that this was in violation of Security council resolutions, and brought the matter to the attention of that organ. The Security council considered the dispute at seven meetings, from Oct. 14, 1954, to Jan. 13, 1955. Council consideration ended on a rather inconclusive note with the president welcoming the Egyptian announcement that the crew had been, and that the ship and cargo would be, released, and expressing the hope that with the assistance of the chief of staff (Gen. E. L. M. Burns) of the Mixed Armistice commission a satisfactory arrangement would be worked out.

On March 1 and 2 the Egyptian government informed the president of the Security council of incidents in the Gaza area

EMPTY SEATS in the United Nations general assembly after the French delegation walked out, Sept. 30, 1955, in protest to the assembly decision to discuss the Algerian problem

and requested a meeting of the organ. After the chief of staff had reported on the situation, the council adopted two resolutions, one on March 29 placing responsibility on Israel and calling upon it to take the necessary steps to prevent such acts, and the other on March 30 calling upon the chief of staff and the two governments to continue consultations with a view to the preservation of security in the area. On April 4 Israel made charges of Egyptian attacks, but the council decided that no further action was necessary. Negotiations were carried on between the chief of staff and the Egyptian and Israeli governments from June 28 to Aug. 24 without success. The frequent repetition of incidents led the chief of staff on Aug. 30 to request a specific cease-fire and to recommend to the Security council that the withdrawal of armed forces along the demarcation line was necessary to the avoidance of further incidents. On Sept. 8 the council adopted a resolution approving the recommendation and calling on the two governments to co-operate with the chief of staff in taking the necessary steps. The announcement late in September of a Soviet-Egyptian deal for the exchange of cotton for arms was widely viewed as accentuating the difficulty of maintaining peace and security in Palestine, particularly by increasing the fears of Israel. On Oct. 26, fighting began in the El Auja area and assumed serious proportions. On Nov. 2 the secretary-general made an appeal to the parties, reportedly asking the clearer delimitation of the boundary line and the withdrawal of military forces. The Security council was not asked at this time to consider the situation.

The ninth general assembly extended the mandate of the UN Relief and Works Agency for Palestine Refugees for another five years and approved budgets of \$25,100,000 for relief and \$36,200,000 for rehabilitation of the fiscal year ending June 30, 1955. The tenth assembly was asked to approve an increased budget for 1955-56 of \$120,100,000, of which \$28,300,000 would be for relief and \$91,800,000 for rehabilitation. Up to June 15, \$23,044,028 of the total amount authorized for relief

for 1954-55 had been pledged. The Conciliation commission was successful in having some money held in block accounts in Israel returned to refugees (nearly \$6,000,000 to refugees in Lebanon), but was unsuccessful in its efforts to get compensation for property taken. Projects for the economic development of the area to provide means of support for refugees made little headway. At the end of June 1955 there were 887,000 refugees on the rolls of the agency, as compared with 872,000 the previous year.

Racial Policies of the Union of South Africa.—During 1955 the UN continued to be concerned with the racial segregation policies of the Union of South Africa, both in general and in their specific applications. The question of the treatment of persons of Indian origin had been before the general assembly since 1946. On Nov. 4, 1954, the assembly adopted a resolution suggesting that the governments of India, Pakistan and the Union of South Africa seek a solution of the question of the treatment of persons of Indian origin by direct negotiations, and that they designate a government, agency or person to assist them in reaching agreement. The secretary-general was asked to make the designation if the parties were unable to agree, and to report to the tenth general assembly on progress made. In June the secretary-general named Luis de Faro, Jr., of Brazil. His report to the general assembly recorded lack of progress.

When the Political committee of the general assembly on Nov. 9 voted to recommend the continuation of the Commission on the Racial Situation in the Union of South Africa, the South African delegation announced its intention to withdraw from participation in the work of the assembly.

Holding of a Review Conference.—In accordance with article 109 of the charter the question of holding a conference to review the charter was placed on the agenda of the tenth session of the general assembly. As directed by a resolution of the assembly's eighth session, the secretary-general, in preparation for the holding of such a conference, published the documents of the Coordination committee of the San Francisco conference of 1945, and prepared for publication an index of the complete documentation of the conference and a *Repertory of Practice of United Nations Organs*. In the general debate opening the tenth session of the general assembly there appeared to be little support for the convening of a review conference in the near future. The secretary-general in his annual report had suggested that in the event the assembly should decide to hold a conference, any decision regarding the time of its convening would be postponed until later.

Economic and Social Co-operation.—*Economic Development.*—In accordance with a recommendation of the eighth assembly, and following United States and United Kingdom statements in the ninth assembly that they would give their support, the United Nations and the International Bank for Reconstruction and Development elaborated machinery for channelling private capital into production investments in underdeveloped countries. In April 1955 the bank submitted to its members the charter of the International Finance corporation to come into operation as soon as it had been ratified by 30 states and 75% of \$100,000,000 capital had been subscribed. The IFC would make direct loans to private enterprise without government guarantees and would be allowed to make loans for other than fixed returns. The operations of the IFC were to be closely coordinated with those of the International bank. As of June 1, 43 states, accounting for more than 85% of the capital, had indicated that they were favourable to membership.

The United Nations was also concerned with the financing of basic nonself-liquidating development projects such as roads, schools and hospitals. These projects had been referred to as the "social-economic infrastructure" on which economic develop-

ment is based. In 1953 a group of experts submitted a proposal for a special United Nations fund for economic development. The matter was considered by the ninth general assembly which expressed the hope that such a fund might be established and asked for a more detailed proposal. In June 1955 a detailed plan was submitted to the Economic and Social council. Most of the funds would be devoted to grants-in-aid repayable in the currency of the borrowing rather than the lending country. The fund would co-operate closely with other international agencies engaged in development projects. The report was on the agenda of the tenth session of the general assembly where it had support from Latin-American, Asian and African members and the smaller industrialized states. The United States continued to make its support conditional on effective disarmament. The U.S.S.R. considered freer international trade the proper approach to the problem.

Technical Assistance.—The year 1954 saw more governments pledge support for the expanded program of technical assistance and in larger sums than ever before.

Total pledges for the year 1954 amounted to approximately \$25,300,000, or about \$2,900,000 more than in the previous year. Total contributions, including arrears from the previous year, amounted to approximately \$28,600,000. Earmarkings for the carrying out of the program totalled \$20,300,000. Total pledges for 1955 to the end of June amounted to \$19,500,000. The large proportion collected by the end of May—\$11,500,000—together with the substantial balance from the previous year enabled the board to authorize earmarkings totalling approximately \$26,000,000 for the 1955 program.

During 1955 continued progress was made in the introduction of a new procedure for programming and allocation of funds approved by the general assembly in its ninth session. This procedure provided for the development of programs on a country basis instead of on the basis of a fixed percentage allotted to each organization. In the interest of greater continuity, the board was authorized to draw up advance target figures for each country on the basis of funds assumed to be available for the following year.

Human Rights.—The Human Rights commission completed in 1954 draft covenants on civil and political rights and economic, social and cultural rights. The general assembly, in its ninth session, undertook a first reading of the covenants, and adopted a resolution inviting governments and specialized agencies to communicate observations to the secretary-general within six months, and providing for detailed consideration of the covenants at the tenth session. The right of self-determination had from the beginning been a highly controversial issue, with the majority of members insisting on the inclusion of a strong affirmation. The Economic and Social council in July 1955 approved a proposal for the appointment of a commission to study and seek further clarification of the question to be submitted to the tenth assembly.

Refugees.—Apart from responsibilities in Korea and Palestine, the UN continued to have responsibilities for about 350,000 unassimilated refugees under the mandate of the UN high commissioner for refugees. The ninth general assembly approved a program designed to bring about a permanent solution of the problem by the end of 1958. The new program sought the integration of refugees into permanent occupations and their resettlement. The high commissioner estimated that the program would cost about \$16,000,000 over a four-year period. Acting under the terms of the assembly's resolution, the Economic and Social council in March reconstituted the advisory committee of the UN Refugee Emergency fund into an executive committee to provide tighter control of operations. The plan of operations for 1955 called for an expenditure of \$4,200,000 of which

\$2,000,000 had been pledged by Aug. 1.

Trusteeship and Nonself-Governing Territories.—*Trusteeship System.*—The scope of the trusteeship system remained limited to 11 territories—three in East Africa (Ruandi-Urundi, Tanganyika and Somaliland), four in West Africa (British Cameroons and French Cameroun and British and French Togoland) and four in the Pacific (Pacific Islands, Western Samoa, New Guinea and Nauru). These territories contain more than 20,000,000 people.

The ninth session of the general assembly reviewed the work of the Trusteeship council and took action dealing with a number of specific problems.

Special attention was given to questions relating to the termination of trustee arrangements for certain territories. In the case of Togoland under British administration, which had been administered as a part of the Gold Coast, the UN was informed by the U.K. in June 1954 that when the Gold Coast became independent in the near future, it would no longer be practicable or desirable to continue the present trusteeship arrangement. The memorandum asked that the general assembly authorize the Trusteeship council to formulate procedures and recommendations by which the wishes of the native inhabitants might be ascertained so that the tenth assembly would be able to take definite decisions regarding the future of the territory. The ninth assembly decided that steps should be taken to ascertain the wishes of the inhabitants, requested the Trusteeship council to make the necessary arrangements and, recognizing the intimate connection between the problems of Togoland under British administration and of Togoland under French administration, requested the council to send a special mission to the two territories to study their problems and report to the tenth assembly. Because of the different political development of Togoland under French administration and French opposition to a special mission, the Trusteeship council in its 15th session in early 1955 voted to send a periodic visiting mission with a special directive to carry out the tasks set by the assembly. The mission consisted of Australia, India, Syria and the U.S.

With respect to the Cameroons, a similar problem had arisen because of the existence of two administrations, British and French, and the greater progress toward self-government in the British-administered territory. British Cameroons is administered as part of the protectorate of Nigeria, and following the putting into operation of a new constitution for Nigeria in Oct. 1954, the U.K. informed the Trusteeship council early in 1955 that it foresaw no other solution for the Cameroons than close association with Nigeria in self-government. This development resulted in a flood of petitions from French Cameroun seemingly motivated by discontent over the absence of comparable political development. The Trusteeship council in its 16th session instructed the visiting mission to give special consideration to and to report on these developments.

Alone of the trust territories, Somaliland under Italian administration was promised independence by a fixed date—1960. The problem faced by the UN in this territory was to achieve sufficient economic, social and political development to give reasonable assurance that the new state would be viable. Both the 1954 visiting mission and the advisory council reported that little progress had been made in meeting the economic problems of the area. A territorial dispute of long standing with Ethiopia remained unsettled.

South-West Africa.—This question had been before the United Nations since 1946. It had its origin in the refusal of the Union of South Africa to place the territory under trusteeship. In the ninth session of the general assembly, consideration was given to the manner in which the general assembly might exercise the function of supervision, and especially the vote by

which general assembly decisions might be taken. The Union of South Africa argued that, consistent with League of Nations practice, no decision could be taken without its approval. The International Court of Justice was asked to give an advisory opinion on the question. In its opinion of June 7, the court held that the general assembly could take its decisions by the same voting procedure as prescribed by the charter for important questions.

Nonself-Governing Territories.—Under article 73(e) of the charter, information was transmitted to the secretary-general in 1954 by eight administering members on 59 nonself-governing territories, as compared with 60 in 1953. Summaries prepared by the secretary-general were considered by the Committee on Information from Nonself-Governing Territories, meeting shortly before the ninth session of the general assembly. In its 1955 session the committee recommended that the general assembly (1) continue the committee for three years; (2) invite members to attach to their delegations competent experts; and (3) encourage like use of representatives of the indigenous peoples. The committee devoted the main part of its discussions to social conditions and problems of social development in the territories. In 1954 the emphasis had been on economic conditions and development. In 1956 the emphasis was to be on education.

Specialized Agencies.—In addition to the work of the UN itself in the social and economic fields, a great deal of important work is done by the specialized agencies, *i.e.*, international organizations operating under their own constitutions for special purposes and brought into relationship with the UN by agreements concluded with the UN. During 1955 the following specialized agencies were in actual operation:

Food and Agriculture Organization (FAO).—Headquarters in Rome, It.; Philip Cardon, director-general; 71 members.

International Labour Organization (ILO).—Headquarters in Geneva, Switz.; David A. Morse, director-general; 70 members. (See separate article.)

International Bank for Reconstruction and Development.—Headquarters in Washington, D.C.; Eugene R. Black, president; 58 members. (See separate article.)

International Monetary Fund.—Headquarters in Washington, D.C.; Ivar Rooth, managing director; 58 members. (See separate article.)

International Civil Aviation Organization (ICAO).—Headquarters in Montreal, Que.; Carl Ljungberg, secretary-general; 66 members.

International Telecommunication Union (ITU).—Headquarters in Geneva, Switz.; Marco Andradá, secretary-general; 90 members plus 5 associate members (including colonial areas).

United Nations Educational, Scientific and Cultural Organization (UNESCO).—Headquarters in Paris, Fr.; Luther H. Evans, director-general; 74 members plus 4 associate members.

Universal Postal Union (UPU).—Headquarters in Berne, Switz.; Fritz Hess, director of the international bureau; 94 members.

World Health Organization (WHO).—Headquarters in Geneva, Switz.; Marcelino C. Candau, director-general; 81 members plus 4 associate members. (See separate article.)

World Meteorological Organization (WMO).—Headquarters in Geneva, Switz.; D. A. Danes, secretary-general; 91 members.

Two further specialized agencies had been envisaged but had not yet entered into force. The convention of the Inter-Governmental Maritime Consultative organization had been ratified by 18 states as of Nov. 1, 1954; ratification by 21 states, including the principal maritime powers, was required. The charter of the International Trade organization had been accepted by Liberia and, conditional on acceptance by the U.S. and the United Kingdom, by Australia; however, no new acceptances had been deposited with the UN. The interim commission of the International Trade organization continued to function, acting chiefly as the secretariat of the contracting parties to the General Agreement on Tariffs and Trade (G.A.T.T.). In the spring of 1955 representatives of 34 countries meeting at Geneva completed the text of an agreement to create an Organization for Trade Cooperation which would administer and facilitate the operation of G.A.T.T. (See also CHINA; EDUCATION; INTERNATIONAL LAW; TRUST TERRITORIES; WORLD HEALTH ORGANIZATION.) (L. M. GH.)

United States. This federal republic in North America, bounded north by Canada, south by Mexico, east by the Atlantic ocean and west by the Pacific ocean, has an area of 3,022,387 sq.mi., including 47,662 sq.mi. of inland water. Its population was 150,697,361 by the 1950 census and 162,284,000 by the July 1, 1955, estimate. Territories and outlying possessions are shown in Table I and the chief cities in Table II.

(See also BIRTH STATISTICS; CENSUS DATA, U.S.; CHURCH MEMBERSHIP; DEATH STATISTICS; INDIANS, AMERICAN; NE-

Table I.—Territories and Possessions of the United States

Territory or Possession	Area (sq.mi.)	Population, 1954 est.	Territory or Possession	Area (sq.mi.)	Population, 1954 est.

GROES [AMERICAN]; also articles on the separate states, territories and possessions.)

President in 1955: Dwight D. Eisenhower (*q.v.*), whose cabinet was composed as follows:

Post	Name	State
Secretary of state	John Foster Dulles	New York
Secretary of the treasury	George M. Humphrey	Ohio
Attorney general	Herbert Brownell, Jr.	New York
Postmaster general	Arthur E. Summerfield	Michigan
Secretary of the interior	Douglas McKay	Oregon
Secretary of agriculture	Ezra Taft Benson	Utah
Secretary of commerce	Sinclair Weeks	Massachusetts
Secretary of labour	James P. Mitchell	New Jersey
Secretary of defense	Charles Erwin Wilson	Michigan
Secretary of health, education and welfare	Marion B. Folsom	New York

History.—During 1955 the people of the United States found themselves in the midst of a new outburst of prosperity, and seemed content to concentrate on building and buying new cars, homes, television sets and all the amenities and necessities of life. The story of 1955 was primarily one of the new boom, and its impact on U.S. society.

Economic Conditions.—The principal element of the new prosperity was the sustained high level of personal income. In Jan. 1955 it stood at an annual rate of \$291,000,000,000, as against \$285,000,000,000 in Jan. 1954. By September the rate had reached \$307,500,000,000, a gain of \$2,200,000,000 over the preceding month. This high level of income was reflected in a steady increase in spending. After a slow start the annual spending rate had jumped to \$30,000,000,000 by November, compared with the peak of \$28,800,000,000 in 1953. Generous credit made buying possible even in excess of personal income; total instalment loans jumped \$2,400,000,000 the first six months, then another \$1,800,000,000 in the third quarter. Total of consumer credit increased from \$29,760,000,000 to \$32,896,000,000 in the first half of the year. Home mortgages in particular rose nearly \$7,000,000,000, compared with a correspond-

ing increase in 1954 of \$4,300,000,000. All this was reflected in sales figures, which by the end of the first half were running to \$70,000,000,000, or \$2,000,000,000 above the 1953 record.

Buying in this quantity provided a tremendous stimulus to all industrial production. Gross national production by October was at the record annual rate of \$392,000,000,000 per year, or \$7,200,000,000 more than in the preceding quarter, most of the increase stemming from a \$6,000,000,000 increase in consumer spending. The federal reserve board's production index rose in October to 142% of the 1947-49 average, 16% higher than the preceding year, and a new record. Steel, bellwether of industry, turned out 115,000,000 tons, 3,500,000 tons over its 1953 peak, and by November was operating at 98.8% of capacity (against 71% in 1954). The auto industry promised 7,000,000 cars by the end of 1955. In spite of this tremendous surge of output, inventories remained reasonable at \$78,900,000,000 in October, only \$2,300,000,000 over Oct. 1954.

Business profits kept pace; the nine-month returns of 562 leading businesses showed net incomes up 33%, with earnings after taxes approaching the \$22,100,000,000 peak set in 1950. Dividend payments reached \$7,100,000,000 by Oct. 1 (10% above 1954), and promised to approach \$11,000,000,000 for the year. But a substantial portion of earnings, plus extensive borrowings, went back into a tremendous program of plant expansion. Commercial bank loans were up to \$78,500,000,000 by mid-November, \$8,000,000,000 more than at the opening of the year. The auto industry led with announcements of expansion plans for 1956 to a total of \$1,800,000,000, with Ford Motor Co. planning for \$500,000,000 a year for three years, and Chrysler \$1,000,000,000 over five years. Standard Oil of New Jersey topped the list of any single firm with \$1,200,000,000 for 1956 alone.

Investment of such huge sums when industrial capacity was already great was based, business leaders reported, on confidence that even more capacity would be required to meet still greater sales in 1956 and thereafter. They predicted total capital expenditures of \$33,400,000,000 in 1956, or \$4,000,000,000 more than the record high of 1955.

It was perhaps inevitable that the construction industry in particular should profit from such progress in plant expansion. Its strength had been in housing, even during the slacker periods of 1954. However, the rate of formation of new households was dropping steadily; the average annual rate of 1,500,000 per year during 1947-50 had fallen to 800,000 annually in the years which followed, and although 1955 seemed likely to register 1,300,000 starts, builders looked forward to less in 1956, if only because of a tightening in the home loan market.

The boom brought with it threats of inflation. After a period of relative price stability, the great demand on industries already near capacity and often facing shortages of labour and supplies, produced a "price bulge." Wholesale prices by Nov. 1 had reached 119.1% of the 1947-49 average, and in selected key industries had gone even higher. As always, this was eventually reflected in an increase in the cost of living, the index of which rose to 114.9%, about equal to the previous postwar peak, with further increases in prospect. This brought on a general tightening of credit. The federal reserve board on April 13 increased its rediscount rate from 1½% to 1¾%, and then repeated the step three times until a record 2½% had been reached by November. Commercial banks jumped their rates on prime loans to big business steadily to a peak of 3½%, the highest in 25 years, as loanable funds became shorter and demand increased.

Congress itself began to take interest, especially in the stock market. In March Sen. J. William Fulbright began what he termed a "friendly study" of the market. In general, witnesses

from finance and business saw little danger in the existing high levels, because they were based, as they pointed out, on a tremendously expanding economy, unprecedented business earnings, and a confident appraisal of the country's industrial future. But Harvard economist J. K. Galbraith, who had just completed an analysis of the 1929 crash, feared a new speculative hysteria, and felt that stock market prices had increased at an unhealthful rate.

However, steps had already been taken to protect the market against speculative excesses. Margin requirements were jumped from 50% to 60% on Jan. 4, and again to 70% on April 22. When bank credit to finance security purchases reached new highs, the federal reserve board acted to limit the amount commercial banks could lend to individuals. (See also BANKING; CONSUMER CREDIT; FEDERAL RESERVE SYSTEM; HOUSING; INCOME AND PRODUCTS, U.S.; PRICES; SAVINGS AND LOAN ASSOCIATIONS; STOCKS AND BONDS.)

Labour.—Full employment accompanied peak production. The total working force rose from 60,688,000 in Dec. 1954 to 65,200,000 in Oct. 1955. Unemployment dropped from 2,838,000 to 2,100,000 over the same period. It seemed a likely time for labour to consolidate its gains and strike out for new objectives. Walter Reuther, president of the C.I.O., set as the goal for 1955 a guaranteed annual wage, and in June signed with the Ford Motor Co. a three-year contract under which Ford agreed to supplement standard state unemployment benefits for all employees paid by the hour. The settlement also included higher pension and disability payments and increased hospitalization benefits. General Motors and Chrysler promptly conceded similar plans.

Also during the year the major labour unions minimized their quarrels with one another, and the two giants, the American Federation of Labor and the Congress of Industrial Organizations, moved toward a permanent union, which was finally effected in December. The question of a name was resolved by combining both names. Membership in the A.F. of L. exceeded 9,000,000; that of the C.I.O. 6,000,000.

In general, the high production records were made possible by the relative absence of major, extended strikes (and by a steadily increased productivity rate). In days lost per thousand persons employed, the United States led the international list in 1952 and 1954, yet this loss represented only 0.2% of total working time—much less than the toll taken by absenteeism and sickness. A one-day steel strike on June 30 brought wage increases for steel workers from \$2.27 per hour to \$2.44 per hour—the highest in industry except in coal mining and oil refining—and more than three times the legal minimum wage of 75 cents per hour. But labour also sought an increase in the minimum wage to \$1.25 per hour, and the secretary of labour, James P. Mitchell agreed that it ought to be raised at least to 90 cents per hour, with an extension of its coverage to 2,200,000 more workers. On July 30 congress granted the extended coverage and also increased the minimum rate to \$1.00 per hour.

Labour also began to worry about increased productivity rates in so far as this represented replacement of men by machines. Industry was becoming increasingly intrigued by "automation," and Walter Reuther foresaw it sparking a "second industrial revolution"—with, however, catastrophic effects unless introduced in a "responsible" manner. Industry, foreseeing a labour shortage, saw no dangers of unemployment. In fact, to maintain high wage levels and multitudinous special benefits, national purchasing power must be kept high by means of lower prices—which in turn could be achieved only by greater production efficiency from the use of machines. Reuther called for higher wages rather than lower prices, to which industry rejoined that higher wages discount the savings of automation in

advance. Both agreed, however, that a four-day, 32-hr. week might be possible within 10 years. For the moment, the spectacular increase in productivity resulting from automation seemed confined to a few plants; the total output per man hour climbed only 3.6% per year, 1947–1953 (just about the same as after World War I). (See also EMPLOYMENT; LABOUR UNIONS; STRIKES; WAGES AND HOURS.)

Agriculture.—The state of agriculture seemed less promising. The steady decline in farm income continued in 1955; farm income dropped 5½% to \$10,200,000,000 by the third quarter, although the department of agriculture announced on Sept. 30 that a four-month decline had been arrested, and that income had even gone up 1% between Aug. 15 and Sept. 15. It was not that the government had done nothing to arrest the decline. Even under the relaxed "flexible" parity plan of 1954, colossal sums were disbursed in support of farm prices; total losses of the government in fiscal 1955 came to \$799,061,464, as against the previous high record of \$419,477,074 in fiscal 1954. At the close of the fiscal year more than \$2,000,000,000 were tied up in crop loans and nearly \$5,000,000,000 in produce owned by the government, the total of the two representing an increase of \$1,000,000,000 since 1954. It was costing more than \$1,000,000 a day just to store this surplus. Here was a new dilemma of the times: might plenty bring poverty rather than prosperity for the farmer? In spite of acreage restrictions the production of staple crops grew and grew, far in excess of internal demand. Unless the government took this surplus, prices might well fall below the costs of production (kept high by industrial prosperity), thus bankrupting the farmer. But could the nation continue to buy up billions of dollars worth of food, and store it, at additional cost and frequent loss?

Determined efforts were made to dispose of the surplus food. President Eisenhower reported on Jan. 10 that the first six months of the Agricultural Surplus Disposal act had resulted in \$453,000,000 in sales and \$125,000,000 in relief grants. The act was further amended on Aug. 15 to increase from \$700,000,000 to \$1,500,000,000 the amount of food surplus which could be sold abroad for foreign currencies. Some food was dispersed free for famine relief. The president in March offered food to Albania, which however felt compelled to refuse it as "foreign interference."

A rising pressure to restore 90% parity stemmed largely from the midwest. A new National Farm Organization gained membership rapidly for its campaign for 100% parity, although Charles B. Shuman, American Farm Bureau Federation president, warned that a return to even 90% parity might wreck the economy. Adlai Stevenson, candidate for the Democratic nomination for president in 1956, came out for 90% parity, in accordance with the general Democratic line. But the secretary of agriculture, Ezra T. Benson, supported by the president, remained convinced of the need for flexible supports, despite a rising chorus of demands for his resignation from Democrats and midwestern Republicans. (See also AGRICULTURE.)

Atomic Energy.—Substantial progress was made in 1955 in the peaceful applications of atomic energy. The Ford Foundation established a Fund for Peaceful Atomic Development and the Joint Atomic Energy committee established an 8-member citizens' panel to study the effect of atomic energy on U.S. life and economy, and to report by the end of the year. Private industry, it was estimated by the Atomic Energy Forum Inc., would expend \$300,000,000 over the next five years in atomic research. To stimulate private industrial and power development, the Atomic Energy commission promised free use of nuclear fuel, free research in AEC laboratories, and payment for technical and economic data. In July the first atomic energy power station in the United States was opened at West Milton, N.Y.

Scientists were still dissatisfied with the rigid security blackout surrounding atomic research, and in February the Federation of Atomic Scientists called for the release of more atomic information for peaceful purposes. In April the United States agreed to share military atomic information with 13 member nations of the North Atlantic Treaty Organization (NATO), and in August joined with 71 other countries in an International Conference on the Peaceful Uses of Atomic Energy. Its principal agenda was Eisenhower's 1953 Atoms for Peace plan, and the president immediately offered, subject to congressional approval, research reactors at half cost, with free fuel, and access to technical knowledge for construction. He also authorized doubling the amount of enriched uranium available to friendly countries. The AEC in February already had released ten tons of heavy water to India, and by the end of July had concluded atoms for peace agreements with 27 nations. (See also ATOMIC ENERGY.)

Foreign Affairs.—The atom still dominated international discussions, with the U.S.S.R. and the United States deadlocked on the subject of international control of atomic armaments. Disarmament discussions proceeded, but made little headway as the Soviets rejected various plans to provide international inspection. Most startling of these was President Eisenhower's proposal for an exchange of blueprints of military installations and for facilities for aerial inspection of them. His suggestion, viewed warily by the Soviet leaders, was made at the conference of the heads of government of the Big Four powers in Geneva, Switz., in July. The United States had viewed sceptically any conference of heads of states, but in deference to world opinion, and hopes, had agreed to it. The results seemed encouraging, though indefinite. The foreign ministers of the four powers were instructed to assemble again in Geneva in October to "propose effective means" for the solution of European security and German reunification, disarmament and increased east-west economic interchange. But the second conference swiftly dissolved the "Geneva spirit" stemming from the

first. The four foreign ministers could come to no agreement on any of the items on the agenda. (See also GENEVA BIG-FOUR CONFERENCES OF 1955.)

The near possibility of war in the far east caused much concern to the United States and its allies in the first months of 1955, as the Red Chinese threatened the offshore islands of Quemoy and Matsu still held by the Nationalist Chinese. Committed to defend Formosa, the U.S. state department refused to say whether these tiny islands constituted part of that defense. The Reds did not invade, and the crisis passed for the moment.

Relationships with Red China were further strained by the imprisonment of 11 U.S. airmen forced down in Chinese territory. In response to a United Nations general assembly resolution, Secretary General Dag Hammarskjöld flew to Peking to seek their release. On May 31, four other airmen were allowed to leave China, but it was not until July 31 that the 11 were released, immediately prior to the opening of U.S.-Chinese talks at Geneva on repatriation of nationals. The talks, however, dragged on inconclusively through the fall.

During the year the emphasis on U.S. foreign aid shifted largely toward Asia: President Eisenhower in his April 20 message asked for \$3,530,000,000 for this purpose, the bulk for Asia. The largest single allocations were to Korea (\$460,000,000) and South Vietnam (\$425,000,000). The final bill authorized \$3,285,800,000, with a foreign aid appropriation, signed Aug. 2, of \$2,703,341,705—raising the total of U.S. foreign aid since World War II to more than \$50,000,000,000. (See also FOREIGN AID PROGRAMS, U.S.)

Defense.—The government's defense policy shifted to reflect the partial relaxation of international tension. Democrats, led by Sen. Stuart Symington, former air force secretary, accused Defense Secretary Charles E. Wilson of undermining the country's armed strength to promote the balanced budget desired by the secretary of the treasury, George M. Humphrey. But Wilson denied the charge, pointing out that he had added \$285,000,000 to his original estimates for fiscal 1956, restoring the total to \$34,500,000,000. Humphrey declared himself in full accord. Wilson did, however, impound \$46,000,000 appropriated for the marine corps over his estimates, when congress on July 13 finally resolved a long argument over its defense appropriation at \$31,882,815,726. Under the new program total armed force strength was to be reduced from 3,218,000 to 2,940,000 by June 30, 1955, and again to 2,815,000 by June 30, 1956. The air force, however, was allowed an increase, the reduction being borne chiefly by the army.

President Eisenhower moved to strengthen the reserve forces, and in the final compromise Reserve Forces act of 1955, signed Aug. 9, an alternative to the draft was provided for youths between the ages of 17 and 18½. (See SELECTIVE SERVICE, U.S.) The draft itself was extended four years (two years for doctors). On March 31 a substantial military pay increase of 6% to 25% was granted to stem the losses of capable men and to stimulate recruiting.

The navy successfully tested its first atomic submarine and began another, and launched the world's largest aircraft carrier the "Forrestal," built at a cost of nearly \$200,000,000. In October contracts were let for a group of space satellites to be built and launched by 1957-58 for scientific research, the resulting information to be available to all scientists.

President Eisenhower also signed a bill establishing a 12-member nonpartisan commission to review and report, by Dec. 31, 1956, on the fairness and effectiveness of the federal loyalty and security program.

Legislation.—On Jan. 17 President Eisenhower presented his budget for the 1955-56 fiscal year, including \$62,408,000,000 of expenditures (65% for national security). Offsetting this he

GRADUATING BUT NOT COMMISSIONED, Cadet Midshipman Eugene W. Landy (centre) keeps his right hand at his side as his classmates at the Merchant Marine academy, Kings Point, N.Y., are sworn in during commencement exercises Aug. 5, 1955. Landy's commission was withheld until Oct. because of his mother's former activities as a member of the Communist party

Table III.—Major Legislation Passed by U.S. Congress in 1955

Act	House vote	Senate vote	Date of enactment
Southeast Asia Treaty (Treaty for the mutual collective defense of southeast Asia signed at Manila, Sept. 8, 1954)		82-1 Yeas: D. 41, R. 40 Ind. 1 Nays: D. 0, R. 1 (Feb. 1)	Instrument of ratification Signed Feb. 4
Judicial and Congressional Salaries (Increased salaries of federal judges, U.S. attorneys, members of congress, certain justice dept. officials and the vice-president and the speaker of the house of representatives)	223-113 Yeas: D. 119, R. 104 Nays: D. 53, R. 60 (March 1)	Passed by voice vote (Feb. 28)	Signed March 2
Tax Rate Extension Act of 1955 (Extended to April 1, 1956, corporate income tax and excise tax rates due to expire March 31, 1955)	386-8 Yeas: D. 200, R. 186 Nays: D. 8, R. 0 (March 30)	Passed by voice vote (March 25)	Signed March 30
Western German Protocols (Protocols with the Federal Republic of Germany signed at Paris Oct. 23, 1954, providing for the termination of the occupation of that country and its admission to NATO)		76-2 Yeas: D. 43, R. 33 Nays: D. 0, R. 2 (April 1)	Instruments of ratification signed April 7
Postal Field Service Compensation Act of 1955 (Increased by an average of 8%, retroactive to March 1, 1955, the rates of compensation of postal field workers)	409-1 Yeas: D. 223, R. 186 Nays: D. 0, R. 1 (June 7)	Passed by voice vote (June 7)	Signed June 10
Trade Agreements Extension Act of 1955 (Extended to June 30, 1958, the power of the president to enter into reciprocal trade agreements without senate ratification)	347-54 Yeas: D. 198, R. 149 Nays: D. 18, R. 36 (June 14)	Passed by voice vote (June 15)	Signed June 21
Austrian State Treaty (Treaty for the re-establishment of an independent and democratic Austria signed at Vienna May 15, 1955)		63-3 Yeas: D. 35, R. 28 Nays: D. 0, R. 3 (June 17)	Instrument of ratification signed June 25
Federal Employees Salary Increase Act of 1955 (Increased by an average of 7.5%, retroactive to March 1, 1955, the rates of compensation of over 1,000,000 federal employees)	Passed by voice vote (June 23)	Passed by voice vote (June 23)	Signed June 28
1955 Amendments to the Universal Military Training and Service Act and the Dependents Assistance Act (Extended to July 1, 1959, power to induct men 18½ to 26 years of age into the armed forces and benefits under the Dependents Assistance Act)	389-5 Yeas: D. 214, R. 175 Nays: D. 1, R. 4 (June 28)	Passed by voice vote (June 28)	Signed June 30
U.S. Debt Limit Extension (Extended for one year through June 30, 1956, authorization for a temporary increase of \$6,000,-,000,000 in the public debt)	267-56 Yeas: D. 134, R. 133 Nays: D. 43, R. 13 (June 27)	Passed by voice vote (June 30)	Signed June 30
Clayton Act Amendments (Granted to the U.S. a right of action to recover damages under the antitrust laws and established a uniform statute of limitations)	Passed by voice vote (April 26)	Passed by voice vote (June 24)	Signed July 7
Mutual Security Act of 1955 (Authorized appropriation of \$3,285,800,000 for U.S. economic, military and technical aid to foreign nations in period July 1, 1955-June 30, 1956)	262-120 Yeas: D. 153, R. 109 Nays: D. 48, R. 72 (July 7)	Passed by voice vote (July 7)	Signed July 8
Department of Defense Appropriation Act, 1956 (Appropriated \$31,800,000,000 for U.S. armed forces in period July 1, 1955-June 30, 1956)	Passed by voice vote (June 30)	Passed by voice vote (June 30)	Signed July 13
Defense Production Act Amendments of 1955 (Extended until June 30, 1956, the authority of the president to allocate and fix priorities of critical and strategic materials and grant defense loans and subsidies under the Defense Production Act of 1950)	Passed by voice vote (Aug. 2)	Passed by voice vote (Aug. 2)	Signed Aug. 9
Reserve Forces Act of 1955 (Provided for a national military reserve program)	315-78 Yeas: D. 169, R. 146 Nays: D. 38, R. 40 (July 25)	Passed by voice vote (July 26)	Signed Aug. 9
Housing Amendments of 1955 (Extended and expanded housing, slum clearance and community redevelopment programs and authorized loans to public agencies for community facilities)	187-168 Yeas: D. 153, R. 34 Nays: D. 37, R. 131 (Aug. 2)	Passed by voice vote (Aug. 1)	Signed Aug. 11
Fair Labor Standards Act Amendments of 1955 (Increased minimum wage under the Fair Labor Standards Act from 75 cents to \$1 an hour)	Passed by voice vote (July 30)	Passed by voice vote (July 29)	Signed Aug. 12

could foresee only \$60,000,000,000 in revenue. However, after 10 months of growing prosperity, government revenues from taxes had risen to the point where Treasury Secretary Humphrey predicted the possibility of a balanced budget. Hopes for 1955-56 stemmed not only from boom times, but also from an extension of expiring excise taxes until March 31, 1956, achieved by congress only after a bitter debate and defeat of a Democratic attempt to reduce the income tax by a flat \$20 per person. The final figures for 1954-55, however, presented a gloomier picture: expenditures of \$64,497,000,000 set against receipts of \$60,303,000,000 left a deficit of \$4,194,000,000, or \$1,300,000,000 more than the president's original budget estimate and \$1,000,000,000 more than the year before. This necessitated a temporary increase in the maximum limit of the national debt to \$281,000,000,000. (See also BUDGET, NATIONAL; DEBT, NATIONAL.)

In general the president seemed dissatisfied with the accomplishments of the Democratic congress when set alongside his 1955 program. Of 13 items of legislation requested, he obtained action on only the military reserve, mutual security appropriation, minimum wage and housing. In each case the results were not what he had hoped for; in housing, for example, congress

finally authorized the construction of 45,000 public housing units; the president had asked 35,000 per year for two years. Of the remaining nine items, four seemed to him especially urgent: schools, highways, health programs and water resources. Statehood for Hawaii and Alaska was shelved again in May.

Eisenhower's own role in government was drastically altered when, on Sept. 24 in Denver, he suffered a heart attack. He returned to his new home in Gettysburg, Pa., in November and began to gradually resume the general responsibilities of the presidency. But his temporary disability had brought to the forefront the almost intolerable burden of the nation's highest office, and resulted in special efforts to divest it of many routine and unnecessary responsibilities. Many proposals for increasing the vice president's role were made, but in general the business of government continued under the direction of the presidential staff. Additional speculation immediately arose as to whether Eisenhower would wish, or be able, to run again, the general feeling being that he would and should not. The president himself refused to state his intentions one way or the other. Among the Democrats, Adlai Stevenson was the first to declare himself a candidate for the nomination.

Social Problems.—Economic growth brought the nation diffi-

cult social problems as well. Chief among these was the rising educational crisis, especially the shortage of educational facilities. In all, the nation faced a shortage of 250,000 classrooms for the new school year beginning in September. The trouble, however, was more deep seated than the shortage of physical facilities. Teachers, among the poorest paid of trained professional people, were deserting the profession in droves.

The Fund for the Advancement of Education analyzed the economic state of teachers as being worse in most cases than in 1929, although other professions, as well as unionized labour, had experienced rapid advances in income.

The commissioner of education, Samuel M. Brownell, estimated a shortage of 141,300 teachers. The worst was yet to come. The National Citizens Committee for the Public Schools foresaw a school population of 48,000,000 within 10 years, requiring 950,000 new classrooms costing an estimated \$32,000,000,000. Where was the money to come from? Traditional reliance on local funds fell short of the needs; educators began to see the only solution in federal aid, though many feared the possible federal control which might go with it. The Eisenhower administration recognized the educational crisis, but drew back from federal aid. The secretary of health and education, Oveta Culp Hobby, promised a White House conference on education in November to study the problem. When it gathered the president urged it to seek a "sensible solution" with a minimum of federal aid, recognizing that educational responsibilities are traditionally and primarily local. But most educators saw no financial solution at the local level.

Higher education had its own crisis. Caught between fixed endowments and shrinking sources of gifts on the one hand, and sky rocketing costs on the other, colleges and universities sank deeper and deeper into the red. Educational costs had risen more than 50% per capita since 1948, tuition only 21%. Half the colleges, reported the council for financial aid to education, were operating at a deficit. Many banded together to raise funds, and directed their efforts particularly at industry, which began to make substantial donations to higher education. (See also EDUCATION.)

Education in the south had its own special problems consequent upon the U.S. supreme court's 1954 decision against the segregation of the races in the public schools. On May 31 the court returned to the subject, directing the states to make a "prompt and reasonable start" toward implementing the ruling, but leaving enforcement to the local courts. Four border states, Delaware, Maryland, Missouri and West Virginia, had already begun compliance; four in the deep south, Georgia, South Carolina, Mississippi and Louisiana, declared unalterable opposition; and nine awaited further instruction. Mississippi, South Carolina and Georgia amended their constitutions to give the state authority to abolish the public school system and subsidize private schools, and Georgia forbade the use of state funds in any mixed school. Louisiana amended its constitution to permit the use of the police power to continue segregation. These four states plus Florida and Alabama made no motions toward compliance; the other 11 took steps in varying degree. The National Association for the Advancement of Colored People claimed that the new school year found 250,000 Negro and white children attending mixed schools which before had been segregated. This, however, compared with 9,281,000 white and 2,397,000 Negro children attending separate schools in segregated areas. (See also LAW.)

Best medical news of the year was the approval by the Polio Vaccine Education centre of Jonas Salk's revolutionary discovery, characterized by the chairman of the board of trustees of the American Medical association as "one of the greatest events in the history of medicine." The federal government immedi-

GEORGE MEANY AND WALTER REUTHER (third and fourth from left) at first convention of the merged A.F. of L.-C.I.O. labour unions, New York city, Dec. 5, 1955. Meany was elected president by a unanimous vote

ately licensed six pharmaceutical firms to manufacture and distribute the vaccine. Controversy arose nearly immediately on discovery of imperfect vaccine from one manufacturer, but the laboratory was later cleared of responsibility, the fault lying in government testing methods. Despite epidemics in Boston and Milwaukee, total cases dropped in 1955 from 19,205 to 16,182 by the time the season passed its peak at Labor Day. (See POLIOMYELITIS; SALK, JONAS EDWARD.)

(See also FOREIGN INVESTMENTS; IMMIGRATION, EMIGRATION AND NATURALIZATION; REFUGEES; TARIFFS.) (E. W. NN.)

Foreign Credits of the U.S. Government.—Outstanding indebtedness to the U.S. government on credits extended to foreign governments and other foreign entities continued to recede from the postwar high of Dec. 1953 and decreased \$19,000,000 in the fiscal year ended June 30, 1955. On that date, the amount outstanding totalled \$11,795,000,000, including all unpaid principal balances on loans extended since the creation of the Export-Import Bank of Washington (in 1934), but excluding amounts due on World War I debts to the U.S. government. Also excluded was the value of military material temporarily transferred to foreign powers.

Although principal collections of \$460,000,000 in fiscal year 1955 exceeded new loan disbursements, they were off 8% from the previous year. Annual disbursements, amounting to \$443,000,000, were down one-third from the slightly drifting rate of the preceding three years. Less than \$2,600,000 of the outstanding indebtedness was charged off as uncollectible during the year; the charge offs were all incurred on loans extended in recent years to nongovernmental foreign entities in efforts to increase production of strategic materials. At the year end, \$58,000,000 of the outstanding principal indebtedness had been due and unpaid for 90 days or more.

Service of the remaining indebtedness was scheduled through-

out the next 45 years.

Interest collections in fiscal year 1955 were \$282,000,000, slightly more than in the preceding 12-month period, and represented an average return of 2.4% on the outstanding indebtedness.

The outstanding balance owed by the western European countries constituted three-fourths of the world total. In the year the High Authority of the European Coal and Steel Community drew on the \$100,000,000 credit established under the mutual security program. The loan was to be repaid over 22 years beginning in 1958; the first of the 3½% interest collections had been made. During fiscal year 1955 Portugal was the only European nation to increase its indebtedness to the U.S. government. Major repayments were made by France (\$81,000,000) and the United Kingdom (\$56,000,000). Among other repayments the Netherlands returned silver which it had lend-leased at a value of \$10,000,000.

Brazil continued to be the country with the most credit activity, drawing \$106,000,000 and repaying \$50,000,000. Disbursement of new relatively short-term loans to Japan by commercial agent banks of the Export-Import bank were off to \$59,000,000. No U.S. government funds were actually expended, but the government assumed the risk of defaults on these credits for the purchase of U.S. cotton. These disbursements were more than offset by the \$88,000,000 repaid by Japan on earlier loans drawn directly from the Export-Import bank and from commercial agent banks.

During fiscal year 1955, new loan commitments by U.S. government agencies totalled \$866,000,000. These included \$170,000,000 under the mutual security program legislation for the year and \$66,000,000 to be disbursed in foreign currencies accruing from the sale of farm products abroad under the Agricultural Trade Development and Assistance act of 1954. The

Export-Import bank was to administer these credits as agents of the International Cooperation administration. From its own available lending power of \$5,000,000,000, the bank committed \$630,000,000. About one-fourth of this was offered to foreigners through United States manufacturers or exporters, under export credit lines. United States Air Force Academy. The United States Air Force academy was established to provide a source of air-minded and air-experienced officers specifically trained for a life-time of service in the air force. It was dedicated on July 11, 1955, at the academy's temporary location at Lowry Air Force base, Denver, Colo.

On that date the first class of 306 cadets, selected from more than 6,000 applicants, was sworn in by the commandant of cadets, Harold E. Talbott, secretary of the air force, delivered the dedication address. The ceremony was attended by military leaders, government officials and thousands of guests from throughout the United States.

The academy's first superintendent, Lieut. Gen. Hubert R. Harmon, a veteran air commander and educator, headed a staff which included Brig. Gen. Don Zimmerman, dean of faculty, and Brig. Gen. Robert M. Stillman, commandant of cadets. It was believed that the faculty might eventually include civilian as well as military instructors, but instructors for the first class were all officers.

The academy's permanent site was selected from among several hundred proposed sites in 27 states. It consists of approximately 17,500 ac. and is located on a plateau east of the Rocky mountains, 7 mi. N. of Colorado Springs, Colo. The elevation averages 6,500 ft., and the climate provides cool summers and moderate winters. Congress authorized the expenditure of \$125,000,000 for construction at the permanent site.

The four-year educational program, leading to a baccalaureate degree and a second lieutenant's commission in the air force, covers education in the traditional sense, as well as airmanship, designed to prepare the cadet for responsibility and leadership as an air force officer.

The academic curriculum is divided between the humanities and the sciences. Such studies as government, geography, history and philosophy are intended to provide an understanding of the political, social and economic factors which influence the great problems of our time. A clear, forceful command of the English language, both in writing and in speaking, is emphasized. The science courses range from the fundamentals of mathematics, physics and chemistry through the technical areas related to aeronautical engineering.

The airmanship program, an ever-present part of cadet life, includes military training, intramural athletics, leadership and flight training. The flight training qualifies graduates in aerial navigation, entitling them to the wings of an aircraft observer. During the sophomore year, the cadets receive indoctrination in pilot training and, if still physically qualified, most graduates go to air force pilot training schools.

Any male citizen of good moral character who will be 17 years old but less than 22 on July 1 of the year he plans to enter the academy, who has never been married and who can meet the prescribed physical standards, may compete for appointment to the Air Force academy. Roughly 85% of the vacancies, allocated to the states on the basis of congressional representation, are filled by competitive examinations among candidates nominated by United States senators and representatives. The

MODEL of the site of the Air Force academy, Colorado Springs, Colo. The first cadet class assembled in July 1955

remainder are filled by competitive examinations among candidates nominated by the president and vice-president, among members of the regular and reserve components of the air force and army, and sons of deceased veterans of the armed forces. The air force makes final selections following the competitive examinations.

The second class, entering in July 1956 was to consist of approximately 400 cadets. The eventual authorized strength of the Cadet Wing was 2,496.

(Rt. C. W.)

United States Congress. The 84th congress, which convened for its second session on Jan. 3, 1956, was comprised of the following members as of that date:

United States Senate
Presiding Officer: Richard M. Nixon (vice-president of the United States)
Majority Leader: Lyndon B. Johnson of Texas.
Minority Leader: William F. Knowland of California.
Democrats: 49; Republicans: 47.

¹Caused by the resignation of Sidney A. Fine, effective Jan. 2, 1956.
²Caused by the death of Vera Buchanan, Nov. 26, 1955.

United States Government Departments and Bureaus: see GOVERNMENT DEPARTMENTS AND BUREAUS, U.S.
 also see under specific name, e.g., COAST GUARD, U.S., etc.

United States Investments Abroad: see FOREIGN INVESTMENTS.

United States Junior Chamber of Commerce: see SOCIETIES AND ASSOCIATIONS, U.S.

United States Mint: see COINAGE.

Universities and Colleges. The following 10 pages carry a selected list of accredited schools of college and junior college grade in the United States and Canada, with certain information for the 1955 spring session. The asterisk * denotes data previous to 1955. The symbol † is used to designate men's schools and ‡ to designate women's schools; those with no symbols are coeducational. (See also EDUCATION.)

Uranium. Since uranium came to popular notice in the mid-1940s, hordes of prospectors seeking wealth had sought the element in all parts of the world and especially in the United States. Relatively few succeeded in finding sources of it capable of being mined and processed economically. Uranium does not occur alone naturally but in combination with other elements. More than 100 known uranium-bearing elements are widely distributed over the earth.

In 1954 about 900 mines were producing from deposits of uranium-bearing minerals in the United States. In addition, operations were maintained in the Belgian Congo, the Union of South Africa, Australia, Canada, Czechoslovakia, France and Portugal. The Colorado plateau, consisting of parts of Colorado, Utah, Arizona and New Mexico, was the most important area in the United States. The state of Washington, at the Spokane Indian reservation, Stevens county, produced in 1955 for the first time. Some uranium was produced in Kern county, Calif. One mine in Nevada came into operation late in 1954 with a small yield. Uranium operations in Pennsylvania were started late in 1954. In the Boulder area of Jefferson and Broadwater counties, Mont., minor quantities were being produced. In addition, some uranium was produced as a by-product of Florida phosphates.

All the uranium ore that was mined in the U.S. was purchased by the U.S. Atomic Energy commission at ore-buying stations, some of which were operated in conjunction with the uranium mills in Colorado, Utah and New Mexico that produce high-grade concentrates. In South Dakota, Wyoming and Arizona there were mills under construction. The uranium concentrates were shipped to Atomic Energy commission refineries at St. Louis, Mo. (run by the Mallinckrodt Chemical Works), and at Fernald, O. (the National Lead Co. of Ohio). These refineries make uranium tetrafluoride and uranium metal, which are used at atomic energy installations. (See ATOMIC ENERGY; METALLURGY.)

Urban Redevelopment: see BUILDING AND CONSTRUCTION INDUSTRY; HOUSING; MUNICIPAL GOVERNMENT; TOWN AND REGIONAL PLANNING; URBAN TRANSPORTATION, U.S.

Urban Transportation, U.S. As of Jan. 1, 1955, the urban transit industry in the United States was composed of 1,587 operating companies. This total included 1,496 companies engaged exclusively in the operation of motorbuses; 56 companies having composite fleets including motorbuses, electric railway cars or trolley coaches or both; 28 companies engaged exclusively in electric railway freight and switching service; 7 companies using railway facilities exclusively in passenger service. There were five rapid transit systems (elevated and subway operations) included in the foregoing.

The transit industry in the United States carried 7,650,000,000 passengers during the first eight months of 1955, 7.84% less than the number carried during the corresponding period of 1954.

The competition from the private automobile, changes in travel habits as the result of the shorter work week and the widespread introduction of television in many areas continued to reduce the number of transit riders, as did strikes of transit companies in various cities.

Operating revenues for the first eight months of 1955 totalled \$936,000,000, off nearly 4% from the same period in 1954. Approximately 180 transit companies in U.S. cities of more than 25,000 population were granted fare increases during the 12-month period ended Aug. 31, 1955. Higher operating costs and the decline in riding made these increases necessary to

maintain the solvency of individual operations.

Except for a few instances where higher premium fares were charged for express service, the 20-cent cash fare continued as the top rate for urban transit companies in cities having a universal city-wide flat fare. The cities served by urban transit companies with fares in this bracket totalled 65.

During the year the industry increased its efforts to arrest the downward trend in traffic and placed greater emphasis on such objectives as speed, convenience, public acceptance and others.

Of all such stimulants, speed was by far the most important. The riders' reaction to a faster ride was most favourable. Total elapsed time from point of origin to point of destination was the most significant reason why people preferred to ride in private automobiles.

To meet this competition, express bus service was being offered in St. Louis, Atlanta, Washington, Cleveland, Chicago, Los Angeles, Philadelphia, Dallas, Detroit, Pittsburgh, San Francisco, Indianapolis, Milwaukee, Minneapolis and St. Paul, among others. Running time from various stops to downtown and time saving over regular service were emphasized.

That there had been an unwarranted exaggeration of the importance of fares in the passenger's mind was evidenced by the fact that, by and large, express service was gaining riders at premium fares while passenger decline continued in regular forms of transit service.

Perhaps the most publicized of all transit merchandising efforts was the club bus plan initiated in Cincinnati. After canvassing the residents of a suburban community, the transit company began operating three buses daily each way into and out of downtown, at times specified by the riders as most convenient to them and on practically a door-to-door service basis. A monthly charge of \$10 was made, plus ten cents, or half the regular fare, per ride. Each club member had a guaranteed seat. The cost to the user of the service, which embraced the principle of a stand-by charge, a feature enjoyed by other utilities but not by transit, was below the cost of driving and parking. That this club plan was working, and being expanded to other communities near Cincinnati and considered by other transit systems, was encouraging, for it represented a specific instance of getting people out of their cars and back onto the transit vehicle.

There were many more examples of how transit was converting to a business that does much more than merely "provide" service. Some heartening results emerged from these efforts. In many communities, relief was granted from gross receipts taxes and other taxes unrelated to earnings. In Wisconsin a law was enacted granting state-wide relief to transit operators and basing taxes on earnings.

In many cities committees of citizens were making thorough studies of how the transit system could be integrated efficiently with the over-all transportation system. In short,

EMPTY TRACKS of New York city's Third avenue elevated, discontinued in 1955, patrolled by a policeman

there was developing a definite trend toward thinking in terms of moving people instead of vehicles. (See also MUNICIPAL GOVERNMENT; RAILROADS.)

(A. W. Br.)

U.S. Urban Transportation Statistics, 1954

Item	Amount	Item	Amount
Miles of line and miles of route operated (Dec. 31)		Vehicle miles operated (calendar year), total	2,548,800,000

Uruguay. A republic in southeastern South America. Uruguay is bounded on the north by Brazil, on the south by the Río de la Plata, on the east by the Atlantic ocean and on the west by Argentina. It is the smallest country in South America, with an area of 68,369 sq.mi. It has a population of 2,800,924 (est. 1954), mostly of European extraction. Montevideo, the capital, has 810,969 inhabitants (1954 est.). Other leading cities (with pop., 1954 est.) are Mercedes 44,900; Salto 44,900; Paysandú 44,000; Minas 36,700; Melo 36,000; Florida 34,200; Rocha 34,000. Religion: Christian, mostly Roman Catholic. President of the governing national council in 1955: Luis Batlle Berres.

History.—On March 1, 1955, Uruguay inaugurated a newly elected national council. This nine-member group executive included six members of the majority Colorado party and three of the Nationalist party. The liberal Colorados had won 387,803 votes in the Nov. 1954 elections against 266,960 for the conservative Nationalists. Former Pres. Luis Batlle Berres, who was elected president of the council, promised to encourage industry and farm production.

Declining world wool prices depressed the market for Uruguay's leading export product. The resulting decrease in foreign exchange earnings made it difficult for the government to support wool prices. The meat export industry was inactive most of the year, except for by-products from animals slaughtered for home consumption, because of lack of agreement on government subsidies to private packers. Corollary effects were a decline in livestock population and an extensive black market in cattle with Brazil. In July foreign packers began slaughtering on a small scale, but by August the relative inactivity provoked a labour crisis arising from exhaustion of unemployment insurance funds. A compromise allowing concessions to packers as well as to workers averted a strike, but exports were not expected to rise until livestock and subsidy questions were solved. The national council ordered domestic consumption of beef cut and arranged for the importation of 60,000 head of cattle from Argentina. The number of animals slaughtered in 1955 was about 60% of the 1954 figure.

Brazil took 85% of the wheat surplus, and good crops of other products such as flaxseed helped to brighten the picture. Nevertheless, rising prices and deficit spending prompted measures to tax retail beverages, lottery tickets and excess profits. A 20% rise in the prices of staples hindered attempts to control the cost of living. The government set up retail outlets to help curb rising prices, but because of protests by small merchants the government-operated outlets were restricted. Hope of balancing the budget faded with the realization that the 1955 deficit would be 55,400,000 pesos, compared with a deficit in 1954 of 49,700,000 pesos.

Relations with Argentina waxed hot and cold until Juan D. Perón's downfall in September. The appointment of veteran Socialist leader Alfredo L. Palacios as the new Argentine ambassador to Uruguay was warmly received. (R. Hn.)

Education.—In 1952 there were 1,957 primary schools with 261,178 pupils and 8,282 teachers and 115 secondary schools with 37,858 students. The University of Montevideo had 11,603 students in 1951.

Finance.—The monetary unit is the peso, valued on Sept. 30, 1955, at 47.62 cents U.S. currency, controlled rate; 35.71 cents, commercial free rate; and 28.9 cents, uncontrolled rate. Actual government expenditure in 1954 (preliminary figures) was 476,800,000 pesos; revenue, 427,100,000 pesos. The public debt on June 30, 1955, amounted to 1,198,100,000 pesos, of which 102,500,000 pesos represented the external debt. Currency in circulation (Aug. 31, 1955) totalled 400,000,000 pesos; demand deposits (May 31, 1955), 337,000,000 pesos. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$73,000,000, of which investments in manufacturing accounted for \$37,000,000. The cost-of-living index (Montevideo) stood at 175 in Aug. 1955 (1948=100).

Trade and Communications.—Exports in 1954 totalled \$248,958,000; imports, \$274,451,000. Leading exports were wool (37%), meat and products (18%), agricultural products (21%), textiles (14%) and hides, skins and leather (7%); leading imports, raw materials, including sugar,

iron and steel and cotton (28%), machinery and parts (16%), fuel and lubricants (14%), construction materials (10%) and motor vehicles (10%). Leading customers were the U.K. (19%), Brazil (14%), the U.S. (13%), the Netherlands (13%) and the U.S.S.R. (8%); leading suppliers, the U.S. (17%), the U.K. (15%), Brazil (12%), Germany (8%) and Venezuela (6%).

Railways (1954) totalled 1,928 mi.; highways (1948) totalled 26,000 mi., of which 3,051 mi. were paved national roads. On Jan. 1, 1954, there were 48,012 automobiles, 40,100 trucks and 1,523 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 49 vessels (100 tons and over) aggregating 69,616 gross tons on June 30, 1954. Telephones (Jan. 1, 1954) numbered 104,510, of which 75% were automatic and located in Montevideo.

Agriculture.—Official preliminary production estimates for major crops in the crop year 1954-55 (in metric tons) were as follows (final figures for the preceding year in parentheses): wheat 716,883 (818,619); linseed 61,559 (64,519); barley 12,024 (13,083); malt barley 27,084 (27,326); (calendar year 1954) maize 207,977 (117,164); rice 52,518 (47,154); sunflower seed 91,688 (109,362); peanuts 3,899 (3,226). The 1951 agricultural census showed 23,408,642 sheep, 8,154,109 cattle, 511,547 milk cows, 667,251 horses and 258,980 pigs. Wool exports in the wool year 1954-55 (Oct. 1-Sept. 30) were 128,948 bales of 460 kg. each (1953-54: 156,853 bales). Meat exports in 1954 included 45,120 metric tons of frozen beef, 21,793 tons of canned beef and 6,871 tons of frozen mutton.

Manufactures.—In 1954 there were an estimated 25,000 industrial establishments with invested capital of 1,005,000,000 pesos and production valued at 1,202,000,000 pesos. Industrial workers totalled 180,185 in 1951. Production estimates in 1954 included cement 280,000 metric tons; sulphuric acid 6,000 tons; electric energy 927,000,000 kw.hr. (J. W. Mw.)

U.S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky mountain state of the United States, admitted to the union in 1896, Utah is popularly known as the "Beehive state." Area: 84,916 sq.mi. (82,346 sq.mi. land, 2,570 sq.mi. water). Pop.: (1950 census) 688,862; (July 1, 1955, est.) 776,000; urban pop. 65.3% of total (1950 census), foreign-born 4.3%, nonwhite 1.7%. Capital: Salt Lake City, pop. (1950 census) 182,121; other principal cities (with pop. 1950 census): Ogden (57,112), Provo (28,937), Logan (16,832).

History.—The 31st session of the Utah legislature ended its 60-day session early in 1955 having passed 186 bills and a number of resolutions. A major accomplishment was the legislative reapportionment bill which provided for a 25-member senate and a house of 64 representatives. Basically, it gives the state's urban areas control of the senate, while the rural districts dominate the house. The act was to go into effect for the 1956 general elections, but by October legal arguments were under way before the state supreme court to determine whether the legislature had exceeded its constitutional powers in passing the bill.

In the field of taxation the legislature approved a number of bills to increase the state's general fund by about \$5,000,000 and voted \$54,700,000 for the next biennium. The general appropriation bill provided for \$2,000,000 expenditures in unearmarked funds above the governor's recommendations, but in an unusual display of felicity between the executive and legislative branches of government, the governor immediately approved it.

Passage of a right-to-work bill, eliminating compulsory union membership as a condition to employment, placed Utah with several other states which had adopted such laws. On April 23 a special session of the state legislature met for eight hours to correct the recently adopted child labour law which left 14- and 15-year-olds with severely restricted fields of employment. The new bill permitted 14- and 15-year-olds to work in most professions formerly permitted for minors at 16.

In the field of local government the 1955 state legislature directed the Utah legislative council to appoint a commission to make a study of possible reorganization of city and county governments. On Oct. 15, 1955, the 11-man Local Government Survey commission appointed by the council reported its recommendations which included: (1) the creation of a new department of finance in county government which would place under a single administrative head the overlapping duties now performed by a treasurer, assessor and auditor, and (2) a recommendation that the State Tax commission be given the respon-

sibility of assessing all property.

The chief officers of Utah in 1955 were J. Bracken Lee, governor; LaMont F. Toronto, secretary of state; Sherman J. Preece, auditor; Sid Lambourne, treasurer; E. R. Callister, attorney general; E. Allen Bateman, superintendent of public instruction.

Education.—For the 1954-55 school year there were 119,476 full-time elementary students enrolled in 380 elementary schools and 71,976 full-time secondary students enrolled in 141 secondary schools. This total of 191,452 was an increase of 8,288 over the 1953-54 figure. During 1954-55 the state certified 3,788 elementary school teachers and 2,915 secondary school teachers. With principals and supervisors the total instructional staff for the state reached 6,894, an increase of 689 over the previous year.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total expenditures for public assistance during the fiscal year July 1954 to June 1955 amounted to \$15,251,931.86 (for 26,569 persons), which was an increase of \$634,570.01 over the 1953-54 figure. The funds were distributed as follows: old-age assistance \$6,801,829.23 (9,739 persons); aid to dependent children \$4,241,983.13 (11,453 persons); aid to the blind \$178,053.50 (256 persons); aid to the disabled \$1,343,591.31 (1,940 persons); aid to unemployables \$705,607.67 (1,024); aid to employables \$685,685.33 (1,642); foster care \$272,659.75 (445 persons); medical care and sight conservation \$24,213.87 (70 persons); welfare services \$172,570; and administration \$825,738.07.

For the year July 1954 to June 1955 the four Utah welfare institutions reported the following expenditures and populations: industrial school at Ogden, \$324,945.32 and 152 students; mental hospital at Provo, \$1,637,601.11 with 1,357 patients; training school at American Fork, \$695,256.60 and 716 students; and the tuberculosis sanatorium at Ogden, \$177,500 with 76 patients.

Communications.—All highways and roads in the state (federal, state and local combined) totalled 31,039 mi. as of Dec. 31, 1954, of which 16,009.4 mi. were surfaced. State and federal funds disbursed for highways and roads totalled \$17,498,652.12 in the 1954-55 fiscal year. New road and highway construction completed during the fiscal year aggregated 368.1 mi. (new and reconstructed roads). Total registered motor vehicles as of Dec. 31, 1954, numbered 310,134 including 243,884 passenger cars. All railroads operating in the state numbered nine in 1955, with track mileage (within the state) of 3,026.64 and line mileage of 1,805.53 (as of Dec. 31, 1954); the track mileage included 96.77 mi. owned by three terminal companies in the state. Airports and airfields in 1955 numbered: commercial and municipal 44; military 5; private 54; other 10. Regularly scheduled air lines operating in the state numbered five in 1955. Operating radio stations in 1955 numbered 20 AM stations and 2 FM stations. Operating television stations in 1955 numbered three VHF stations.

Banking and Finance.—As of June 30, 1955, the 45 state banks had resources totalling \$468,711,808.44 and the 9 national banks \$342,196,997.29 for a combined total of \$810,908,805.73, an increase of \$45,441,991.61 over 1954. Deposits for the 45 state banks reached \$433,569,157.55, while the 9 national banks reported deposits of \$319,391,577.71 for a combined total of \$752,960,735.26. There were 15 state-chartered savings and loan associations with total resources of \$91,621,782.63.

State receipts for the fiscal year ending June 30, 1955, were \$110,629,405.50; disbursements amounted to \$115,672,421.90. There was no bonded indebtedness for the state as a whole.

Agriculture.—For Utah, 1954 cash receipts from livestock and products totalled \$110,539,000, down 1.25% from 1953; crops \$38,752,000, down

amounted to \$102,055,000.

Manufacturing.—Total wages for 1954 showed a decrease of \$4,744,291 from 1953. (B. D. M.)

†Value included with other minerals.

Mineral Output.—Table III shows the tonnage and value of those mineral commodities produced in Utah in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Utah was second among the states in the production of copper, gold and silver, third in manganese, fourth in iron and fifth in fluorspar; and ranked 13th in the value of its mineral output, with 2.08% of the U.S. total.

Vatican City State. This sovereign, independent state was established by the Lateran treaty between the Holy See and the Italian government on Feb. 11, 1929. The treaty was recognized in international law with the reigning pope as sovereign and was made an integral part of the constitution of Italy on March 26, 1947.

Diplomatic representatives of 45 nations are accredited to the Vatican. The Holy See in its diplomatic relations with other governments through the world is represented by 40 nuncios and internuncios.

The area of Vatican City is 108.7 ac., excluding the papal domain of Castel Gandolfo outside of Rome. Vatican City includes Saint Peter, the Vatican palace and museum, the Vatican gardens and neighbouring buildings. Thirteen basilicas and edifices in Rome, although they are outside the boundaries of the state, enjoy extraterritorial rights.

The normal population of Vatican City is approximately 1,000, most of whom are ecclesiastics. Two hundred and fifty lay persons are enrolled in the Pontifical Armed Corps which includes the Swiss Guards, the Palatine Guards of Honor, the Noble Guards and the Papal Gendarmes.

During 1955 the Vatican accepted an invitation to participate in the conference on the peaceful uses of atomic energy which took place in Geneva, Switz. A Vatican delegate, Msgr. Alfred Teobaldi, attended the first United Nations Congress on the Prevention of Crime and Treatment of Offenders which also took place in Geneva.

The West German federal government declared that "with the appointment of a West German Ambassador to the Holy See last year (1954), a new stage was begun in the good relations which have always existed between the Vatican and the Federal Republic." It paid tribute to the Vatican's relief efforts and said that Pius XII, "who contributed so much to ease the material and spiritual distress of Germany during the first post-war year, also professed his benevolent interest in Germany during the past year."

In 1955 14 world known scholars, natives of eight countries

4.43%; crops and livestock combined \$149,291,000, down 2.1%. Adding in government payments of \$2,662,000, total cash receipts for Utah farmers in 1954 amounted to \$151,953,000. Adding also the value of crops, livestock and products consumed in farm homes, estimated at \$1,519,000, gave a total farm income of \$153,472,000 for 1954, down 6.09% from 1953. The total value of livestock on Utah farms as of Jan. 1, 1955,

Vegetable Oils and Animal Fats. Record U.S. oilseed crops in 1955 plus a very high level of pork and beef slaughter provided a superabundance of fats and oils. Oilseed production was a record 132% of the 1947-49 base, as compared with 118% in 1954. Included were 371,898,000 bu. of soybeans, about 6,119,000 tons of cottonseed, 1,738,725,000 lb. of peanuts and 42,985,000 bu. of flaxseed.

Table I.—U.S. Production of Principal Fats and Oils

	(In millions of pounds)			
	1955*	1954†	1953	Average 1937-41

Total	14,433	13,580	13,066	8,689

*Forecast. †Preliminary.

Price supports were generally lower: in the case of soybeans at \$2.04 per bushel, 70% of parity, as compared with \$2.22 and 80% of parity for the 1954 crop; flaxseed at \$2.91 per bushel (65% of parity) against \$3.14 and 70% in the previous year; peanuts at 12.2 cents per pound (90% of parity) in both years; and cottonseed at \$46.34 per ton (65% of parity) as compared with \$54 per ton (75% of parity) on the 1954 crop. In October farmers averaged \$2.08 per bushel for soybeans, \$2.76 per bushel for flaxseed, 11.8 cents per pound for peanuts and \$43.50 per ton for cottonseed.

Exports of animal fats and greases were valued at \$171,670,000 in 1954-55 as compared with \$140,626,000 in the previous year. Oilseeds exported were valued at \$170,990,000 and vegetable oil exports at \$115,181,000. Supplementary imports of oilseeds were valued at \$55,748,000 and vegetable oils at \$77,099,000. Tung oil imports, almost wholly from Argentina, approxi-

mated the agreed maximum quota of 21,800,000 lb. for the year ending Oct. 31, 1955.

World production of fats, oils and oilseeds appeared likely to exceed the 28,000,000 short tons (oil equivalent) of 1954 and to be far above the average 23,995,000 tons of 1935-39.

Whale oil production was forecast at 415,000 tons and sperm oil at 85,000 tons in 1955.

Preliminary indications were that world export would reach 7,200,000 tons, oil equivalent, slightly below the record of 7,250,000 tons in 1954 but about 10% above prewar. (See also COTTON; PEANUTS; SOYBEANS.)

(J. K. R.)

Vegetables. The 1955 volume of the U.S. vegetable production for fresh use and processing was 2% larger than in 1954, approximately one-fifth more than before World War II, but slightly below the 1947-49 average. The estimated total of 24,500,000,000 lb. of commercial vegetables for sale fresh at local and distant markets (but excluding household gardens) provided 141 lb. of fresh vegetables per capita. Somewhat smaller supplies, together with higher consumer incomes, resulted in a price index of 230 (1910-14=100) for fresh vegetables in September as compared with 173 in Sept. 1954 and 221 for the full year 1954. Exports of vegetables and preparations in 1954-55 were valued at \$101,900,000 as compared with \$88,864,000 in the previous year. Imports of supplementary vegetables and preparations were valued at \$25,088,000 as compared with \$31,791,000 in 1953-54.

Commercial Truck Crops for the Fresh Market.—The winter fresh vegetable crop of Florida, the Gulf coast and the southwest, harvested early in the year, was 1,461,100 tons, 94% as much as in 1954 and 99% of average. The spring crop of fresh vegetables was 2,531,100 tons, 4% below 1954 but 8% above average. Fresh summer vegetables were abundant; the 4,402,900 tons were 2% in excess of 1954 and 5% above average. The indicated fall fresh vegetable crop of 1,961,000 tons was 97% of 1954 and 2% below average. Preliminary indications for early 1956 were for a smaller crop of winter beets and spinach, a kale crop 5% larger than the previous year, and a record large winter lettuce crop.

Commercial Truck Crops for Processing.—The 1955 production of cucumbers for pickles, green peas, pimientos, spinach and tomatoes exceeded the 1954 tonnages, but green lima beans, snap beans, beets, kraut cabbage and sweet corn yielded less than in 1954. The 1955 packs of both canned and frozen vegetables were a little larger than in 1954, but carry-over stocks were lower; stocks of frozen vegetables in July were 410,000,000 lb., 8% less than a year earlier. Supplies per capita were 40.9 lb. of canned and 5.8 lb. of frozen vegetables, the latter 2% less than in 1954.

Dry Edible Peas and Beans.—The 1955 U.S. dry edible bean crop, indicated at 19,094,000 bags of 100 lb. each, was larger than the 18,899,000 bags of 1954 and the 1944-53 average of 17,317,000 bags. Michigan produced 4,888,000 bags; the Cali-

fornia crop was reduced below earlier prospects to 4,848,000 bags (5,122,000 bags in 1954); followed by Idaho with 2,594,-

Table II.—U.S. Production of 11 Vegetables for Processing

000 bags. Prices to producers in October averaged \$7.04 per hundredweight as compared with \$7.81 per bag a year earlier. The official support price averaged \$6.36 per hundredweight, or 70% of parity, as compared with \$7.24 per hundredweight, or 80% of parity, on the 1954 crop. U.S. export of 1,739,000 bags of dry beans in 1954-55 was 21% below 1953-54.

The dry field pea crop of 1955, largely produced in Washington and Idaho, was indicated at 2,833,000 bags, the second smallest crop since 1940, one-fifth below the 3,484,000 bags of 1954 and only three-fifths of the 1944-53 average of 4,764,000 bags. The average price to producers in October was \$6.41 per bag (100 lb.) as compared with \$4.31 a year earlier. The U.S. in 1954-55 exported, partly from Commodity Credit corporation stocks and largely to Europe, 1,233,000 bags of dry edible peas, a new record and more than double the 543,000 bags exported in 1953-54.

Of a large world lentil production, about 1,500,000 bags moved in world trade; Turkey, Argentina, Algeria and Chile were the major exporters; western Germany was a major importer. Prices were about 10% higher than in 1954. (See also POTATOES.) (J. K. R.)

Venereal Diseases.

In spite of the encouraging advances made in the treatment and control of the venereal diseases, they continued to be serious public health problems. This was reflected in morbidity data showing that approximately 374,000 cases of venereal disease were reported in 1955. The situation was further accentuated by the fact that in the fiscal year 1955, 17 states of the United States had more new cases of infectious syphilis reported than during the previous year, and 25 states showed increases in reported cases of gonorrhoea.

State and territorial health departments reported 126,931 cases of syphilis in all stages. Of this total 6,698 were cases in the early infectious lesion stage of the disease, 22,230 were cases in the early latent stage, 86,394 in the late and late latent stages. There were 5,779 cases of congenital syphilis reported in 1955. In 1954, 78.2% of the congenital syphilis patients reported by age were 10 years of age or older. Reported cases of gonorrhoea in continental United States numbering 239,787 for fiscal year 1955 were higher than for the previous 12 months. This was the first time an increase over the previous year had been shown in gonorrhoea morbidity since 1946. Chancroid, lymphogranuloma venereum and granuloma inguinale in the states and territories accounted for 4,410 cases, of which chancroid comprised two-thirds.

Total mortality from syphilis in the fiscal year 1955 was estimated at 4,970 deaths, a rate of 3.1 per 100,000 population. This estimate was based on information given as to the cause of death on a 10% sample of death certificates. In 1953 the infant mortality rate resulting from syphilis was 1.4 per 100,000

live births. These deaths from syphilis represented casefinding and treatment failures.

The rate of first admissions to all mental hospitals (exclusive of Veterans administration facilities) from psychoses resulting from syphilis was 1.8 per 100,000 population in 1952. However, the tragic consequences of uncontrolled syphilis were strongly reflected in the fact that 38,000 persons with syphilitic insanity were in mental hospitals in Sept. 1955 because their infections were not discovered and treated early. While the rate of first admissions to mental hospitals because of syphilis had declined, the cost of maintenance of patients hospitalized because of syphilitic blindness in 1951 was more than \$12,000,000. The estimated loss of income by males hospitalized with syphilitic psychoses in 1952 was more than \$98,000,000.

Venereal disease diagnostic and treatment services were provided in 20 prevention and control centres operated and staffed by local health departments in 7 states and the District of Columbia. In addition to these centres 2,113 venereal disease clinics in 48 states and 4 territories were maintained. Of the 1,858,000 persons examined in these clinics in 1955, 297,000 (16%) were admitted for treatment. Staff members of health departments interviewed 170,000 patients for their sex contacts. Finding these contacts of civilians plus contacts of military personnel, as well as other suspects, resulted in a total of 380,000 investigations. More than 70%, or 266,000 persons, were brought to examination which resulted in 104,500 persons with a venereal disease being brought or returned to treatment.

The changing prevalence of syphilis made acute the need for a more specific serologic test for syphilis, simple enough to be performed in the average serologic laboratory. The public health service's Venereal Disease Experimental laboratory at Chapel Hill, N.C., developed such a test. It was named the *Treponema pallidum* Complement Fixation (TPCF) test. Chemical fractionation of pathogenic *T. pallidum* produced a proteinlike antigen, which, when used in the usual complement fixation test procedures, appeared to be specific for treponemal infections. The results were highly reproducible and easily read. Commercial manufacture of the antigen appeared feasible and was being undertaken by two companies. (See also EPIDEMIOLOGY.)

(C. A. S.)

Venezuela. The republic of Venezuela, with an area of 352,142 sq.mi., had an estimated population of 5,774,000 (1955), not including indigenous tribes living outside of cities. The capital, Caracas, had 611,048 inhabitants (1953 est.). Other cities of importance were Maracaibo with 304,313, Barquisimeto 132,123, Valencia 105,315, Maracay 77,049, San Cristóbal 64,970, Cumaná 56,604, Ciudad Bolívar 36,278, Puerto la Cruz 36,000 and Puerto Cabello 35,000. President in 1955 was Marcos Pérez Jiménez.

History.—Venezuelan relations with other American states continued to be amicable during 1955. New commercial agreements with France and Great Britain were discussed; one was concluded with Switzerland. The president made a state visit to Peru in June, and received a return visit from the president of Peru in August. A number of new roads and other public works were completed during the winter of 1954-55, but no new projects in the field of public works were undertaken. The stability of the budget was maintained so that the fiscal year could close with no deficit. The Agrarian institute began in Táchira a new agricultural colony, similar to that opened at Turén in 1953. When completed in 1960, it would cover an area of 50,000 ac, no holding being less than 25 ac. The estimated cost was \$12,000,000. Plans for other colonies were being prepared by the institute. The government's project of petrochemical plants which would provide fertilizer and like products was given effect in 1955 with the letting of contracts for one

plant near Puerto Cabello. Other new industries were begun, with both foreign and domestic capital.

At the end of February a meeting of the oil division of the International Labour office was interrupted by the expulsion from Venezuela of a foreign delegate who had engaged in sweeping criticism of Venezuela's labour policy. As the government refused to permit his return unless he were to retract his allegations, the ILO in Geneva, Switz., suspended the meeting, whereupon Venezuela immediately withdrew from the International Labour office.

Petroleum production and exportation continued at the high levels of 1954, despite recurrent rumours and threats of legislative restrictions upon the importation into the United States of foreign oil. The production of sugar, coffee and dairy products continued to meet the requirements of a rapidly growing population. Some emphasis upon agricultural workers was placed by the immigration authorities in 1955, and the effort was being made by the immigration agencies in Europe to select entire families versed in agricultural specialties.

Railroad construction continued, and the shipping company was thoroughly reorganized. In August Col. Llovera Páez, in charge of special economic development studies since the beginning of the administration, became also minister of communications. This was considered to be the first step in the regrouping of ministries announced in the presidential message of April 1954.

The dredging of the Maracaibo bar was vigorously pushed during 1955 in order that Lake Maracaibo might be entered by ships of deeper draft somewhat earlier than the projected terminal date (1958).

Unemployment continued to be insignificant, but the net addition to population from immigration fell off from the levels of recent years because of some slight repatriation. (See also FOREIGN INVESTMENTS.) (C. E. Mc.)

Education.—At the end of 1954 there were 7,014 primary schools, public and private, with 608,976 pupils and 16,944 teachers, and 197 secondary and special schools with 33,481 students. University education was available at three public and two private universities with total attendance of 7,645 in 1954. Education was allotted 6.4% of the 1955-56 budget.

Finance.—The monetary unit is the bolivar, valued at 29.85 cents U.S. currency during 1955. The 1955-56 budget (July 1-June 30) was balanced initially at 2,555,000,000 bolivares. Actual revenue in 1954-55 was 2,829,531,543 bolivares; expenditure, 2,549,440,251 bolivares. There was no external debt; the total government and government-guaranteed debt was 496,532,000 bolivares on Dec. 31, 1954. Currency in circulation (July 31, 1955) totalled 920,000,000 bolivares; demand deposits, 1,287,000,000 bolivares. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$1,399,000,000, of which petroleum investments accounted for \$1,038,000,000. The cost-of-living index (Caracas) stood at 123 in June 1955 (1948=100). National income in 1953 was estimated at 9,893,000,000 bolivares.

Trade and Communications.—Exports in 1954 totalled 5,660,989,648 bolivares; imports, 2,745,803,659 bolivares. Chief exports were crude petroleum and petroleum products (94%), iron ore (2%), coffee (2%) and cacao (1%); leading imports, machinery and apparatus (35%), metals and manufactures (18%), foodstuffs (12%) and textiles (6%). Leading suppliers were the U.S. (62%), the U.K. (8%), Germany (7%), Canada (4%) and France (4%). The Netherlands Antilles and the U.S. were the principal customers.

Railways (Dec. 1950) totalled 759 mi., including 128 mi. of industrial trackage; highways (1953), 10,243 mi. of all-weather roads. On June 30, 1954, there were 112,048 automobiles, 75,921 trucks and 5,260 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 103 vessels (100 tons and more) aggregating 211,983 gross tons on June 30, 1954. Telephones (Jan. 1, 1954) numbered 92,420, 93.7% of which were automatic and 69% of which were located in the federal district.

Agriculture.—Production estimates for the 1954-55 crop year (preliminary figures) included coffee 580,000 bags of 132 lb. each; cacao 37,037,000 lb.; maize 326,000 metric tons. In 1954, 93,669 metric tons of sugar, 30,895 tons of rice (milled), 642 tons of cotton and 14,991,000 lb. of tobacco were produced and 431,000 bags of coffee were exported. The 1950 census showed 5,631,986 cattle and 1,467,178 pigs.

Manufactures.—Production in 1954 included cement 1,212,021 metric tons; soap 16,376 tons; cigarettes 2,995,130,000 units; tires 372,045 units; beer 138,757,000 l.; cotton cloth 14,210,860 metres; electricity 979,257,000 kw.hr.

Minerals.—Production of crude petroleum in 1954 totalled 691,788,000 bbl.; natural gas, 764,015,000 cu.ft. Crude petroleum exports totalled 528,634,000 bbl. in 1954; refinery throughput 161,853,000 bbl.; exports of refined products 126,250,000 bbl. At the end of 1954 proven reserves totalled 10,919,000,000 bbl. and maximum refining capacity was 483,-

MARCOS PÉREZ JIMÉNEZ (right), president of Venezuela, receiving his sword July 5, 1955, marking his promotion to the rank of brigadier general. Jiménez thus became the first general in the army of Venezuela since 1945. Minister of defense Col. Oscar M. Carta is presenting the sword

595 bbl. per day; oil pipelines totalled 2,116 mi. in length. Production of other minerals in 1954 included iron ore 5,388,638 metric tons; gold 56,100 troy ounces; diamonds 96,983 carats; coal 32,047 tons; lead 900 tons; asbestos 674 tons. (J. W. Mw.)

Vermont. A north Atlantic state of the United States of America, the only one of the New England states without a seacoast, Vermont is popularly known as the "Green Mountain state"; it was admitted to the union in 1791. Area: 9,609 sq.mi., of which 331 sq.mi. are water. Population (1950) 377,747 (including 240,135 rural, 137,612 urban; 348,435 native white, 443 Negro, 28,753 foreign born). The U.S. bureau of the census estimated the population of the state to be 377,000 on July 1, 1955. The chief cities are Montpelier (cap., pop., 1950 census) 8,599, Burlington 33,155 and Rutland 17,659.

History.—The general assembly met in 1955 from Jan. 5 to June 11, the longest session on record. Legislation enacted or amended included acts authorizing the state of Vermont to enter into a compact with other states in New England to establish the New England Board of Higher Education, making the University of Vermont and State Agricultural college, Burlington, a state institution, approving bonding for the construction of highways instead of the former pay-as-you-go plan, enabling the construction of limited access highways, authorizing purchase and administration of Salk polio vaccine and authorizing and empowering the public service commission with approval of the governor to enter into contracts for purchase and transmission of electrical energy from the place of purchase to a point or points within the state and resell such energy to electric distribution companies on a nonprofit basis.

The Chester A. Arthur State park in Fairfield was dedicated Aug. 25, 1954. The park, a shrine to the Vermont-born president of the United States, commemorates his birthplace.

Chief officers of the state during 1955 were Joseph B. Johnson, governor; Mrs. Consuelo Northrop Bailey, lieutenant governor; George H. Amidon, state treasurer; Howard E. Armstrong, secretary of state; David V. Anderson, auditor of accounts; Robert T. Stafford, attorney general. Mrs. Bailey was the first woman to hold the office of lieutenant governor of Vermont.

Education.—The number of elementary schools in the state on June 30, 1955, was 614. The elementary school enrolment 1954-55 was 51,320 and the teaching staff 2,023. There were 81 public high schools in the state in 1954-55, with an enrolment of 18,022 and teaching staff of 837. Total current expenditures for education, exclusive of capital outlay, were \$15,531,235.81, of which \$3,471,963.25 (about 22%) was paid by the state to the local school districts for general state aid. Aid approved by the 1953 general assembly to local school districts for the construction and alteration of buildings, and paid in 1953-54, for construction started since July 1, 1947, amounted to \$1,430,927, and aid for construction for

the year ended June 30, 1955, was \$841,505.54. The state superintendent of schools was the commissioner of education A. John Holden.

Social Insurance and Assistance, Public Welfare and Related Programs.—Relief in general was administered by the overseer of the poor in each town. An average number of 6,858 persons a month received old-age assistance from state funds amounting to \$3,745,119.76 during the year ended June 30, 1955. Aid to dependent children was distributed to an average number of 1,132 recipients monthly, from funds amounting to \$812,409. Blind assistance funds amounting to \$94,461 were distributed to about 162 persons a month. Aid to the disabled was paid to about 447 persons a month, and amounted to \$243,059.

Unemployment compensation payments made under the Vermont law numbered 174,335, and amounted to \$3,875,683 for the year ended June 30, 1955. The three state correctional institutions during the year ended June 30, 1955, had an average of 444 inmates; their total expenses were \$774,791.

Communications.—The total mileage of the public highway system (state, state-aid and town highways) as of June 30, 1955, was 13,678 of which 1,852 mi. were in the state system and 2,777 mi. in the state-aid system. Total expenditures during the fiscal year ended June 30, 1955, amounted to \$15,633,136.42. There were 853.3 mi. of railways in the state in the year ended Dec. 31, 1954; telephone subscribers were estimated at 81,750. Airports numbered 20, seaplane landing area 1 and airways 4, with a total mileage of about 300 during the year ended June 30, 1955 (official CAA figure of 250 mi., to which was added 50 mi. for the airway established between Montpelier and Newport in 1955).

Banking and Finance.—The number of state and national banks as of June 30, 1955, was 73 of which 37 were state banks with total deposits of \$244,863,468.17. The seven state co-operative building, savings and loan associations had assets of \$5,596,692.40.

Total receipts of the state as of June 30, 1955, were \$48,193,467; total disbursements \$51,954,308.94; there was no unappropriated surplus, but rather a deficit of \$569,038.44; total debt outstanding was \$7,531,000.

Agriculture.—Vermont cash receipts from farm marketing for the year 1954 according to the agricultural marketing service of the U.S. department of agriculture totalled \$106,200,000 compared with \$110,200,000 in 1953. In the fall of 1954 the state had 15,981 farms, a drop of 3,062 farms in five years, but the total land in the state's farms declined only three tenths of 1%.

Honey produced in Vermont in 1954 amounted to 506,000 lb. compared with 260,000 lb. in 1953. Production of maple syrup in 1955 according to the agricultural marketing service of the U.S. department of agriculture was very uneven throughout the state. The apple crop was the largest in more than 20 years.

There were 479,000 head of cattle on Vermont farms Jan. 1, 1955, of which 320,000 were cows and heifers kept for milk production, compared with 484,000 head in 1954, of which 317,000 were kept for milk production. There were 115,000 turkeys raised on Vermont farms in 1955, compared with 128,000 in 1954.

Table I.—Principal Crops of Vermont

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	3,060,000	2,856,000	2,602,000
Hay, tons	1,441,000	1,343,000	1,340,000
Apples, commercial, bu.	1,230,000	880,000	770,000
Oats, bu.	980,000	840,000	1,219,000
Potatoes, bu.	731,000	720,000	1,146,000
Maple syrup, gal.	665,000	721,000	690,000

Manufacturing.—The Vermont unemployment compensation commission reported for the year ended June 30, 1955, an average of 35,769 persons a month in manufacturing industries covered by the state unemployment

Table III.—Mineral Production of Vermont

Mineral	Quantity 1953 (in short tons)	Value 1953	Quantity 1952	Value 1952
Lime	?	\$?	\$
Sand and gravel	1,114,000	690,000	1,264,000	750,000
Stone	527,000	8,660,000	404,000	6,017,000
Talc	80,000	241,000	71,000	927,000
Other minerals	10,511,000	...	10,197,000
Total		\$20,302,000		\$17,891,000

*Value included with other minerals.

compensation law (all industries 62,814); wages paid to such workers in manufacturing industries \$122,767,858 (all industries \$205,318,699). (C. E. FE.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Vermont in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Vermont was first among the states in the production of asbestos, second in slate, third in ilmenite, fourth in talc and fifth in pyrite; and ranked 40th in the value of its mineral output, with 0.14% of the U.S. total.

Veterans Administration (U.S.)

The nation's population of veterans reached 22,000,000 in Oct. 1955. Of these, 80%, or 15,400,000, served in World War II; 4,000,000 were in uniform during the period between the start of the Korean conflict, June 27, 1950, and Jan. 31, 1955, and the rest served in other wars and during time of peace. Benefits for veterans and their families are administered by the Veterans administration, an independent agency of the United States government.

Korean G.I. Bill.—Perhaps the most far-reaching of all benefits for Korea veterans was the G.I. bill, enacted in 1952, containing five programs designed to help those young veterans readjust to civilian life.

One of the programs is government aid for G.I. education and training. A veteran may receive one and one-half days of G.I. training for each day spent in service during the Korean conflict period. The maximum is 36 months.

While training, he receives an allowance each month to cover part of his expenses and living costs. Rates for veterans in school full time are \$110 if they have no dependents; \$135 if they have one dependent; and \$160 with more than one dependent. Rates for part-time training—as well as for on-the-job and on-the-farm training—are lower.

By Sept. 1, 1955, more than 1,000,000 Korea veterans—or one out of every four who served during the Korean conflict period—had taken some form of Korean G.I. bill training. More than 50% had gone to college; another 34% trained in schools below the college level; 12% had taken on-the-job training; and 4% trained on the farm.

Another Korean G.I. bill program permits veterans to obtain government-guaranteed or insured loans on the same basis as veterans of World War II. Loans for homes may be guaranteed for up to 60% with a maximum guarantee of \$7,500. Other real-estate loans are guaranteed for up to 50% with a \$4,000 maximum. Nonreal-estate loans also may be guaranteed for 50%, but with a \$2,000 maximum.

As of Sept. 1, nearly 200,000 veterans had obtained loans under the Korean G.I. bill. About 90% purchased homes. The loans totalled nearly \$2,000,000,000, of which VA had guaranteed \$1,100,000,000.

VA administers both the G.I. training and G.I. loan programs. The remaining benefits of the Korean G.I. bill are handled by other agencies. The unemployment compensation program—payments of \$26 a week for up to 26 weeks—is administered by the U.S. department of labour. The armed forces handle a mustering-out program, which provides payments ranging from \$100 to \$300 for persons coming out of service. The U.S. employment service is charged with providing job-finding assistance to Korea veterans.

Vocational Training for the Disabled.—Rehabilitation training is available to disabled World War II and Korea veterans who have service-connected disabilities and need training to overcome the handicap of their disabilities. While in training, and for two months afterward, they may receive a subsistence allowance from the government, in addition to all training costs which the government pays directly to their schools.

By Sept. 1, 1955, a total of 609,000 disabled World War II veterans and 30,000 disabled Korea veterans had received training.

A survey, released by VA in 1955, disclosed that rehabilitated disabled veterans had made an outstanding adjustment to the workaday world. At the time of the survey, 95% of the veterans were employed; nearly all were using skills learned in training; 99% stated they liked the kind of work they were doing; and they had doubled their prewar incomes to the point where they were earning \$400 a year above the national average.

World War II G.I. Bill.—Of the three major benefits of the G.I. bill for World War II veterans, one still was in full force during 1955, one had passed its cutoff point and would end for most veterans in 1956 and the third had long since expired.

The G.I. loan program—in full operation until 1957—had provided loans to more than 4,000,000 World War II veterans, 90% of whom purchased or built homes. In July 1955 moderate credit restrictions were placed on all G.I. loans, calling for a down payment of at least 2% and a maximum repayment period of 25 years. The reason was to help protect prospective veteran home buyers against increased prices and overextension of credit.

Under the G.I. education and training program, a total of 7,800,000 World War II veterans had received training. This figure represents more than half of all who served during World War II. The program would end for most veterans on July 25, 1956.

The third benefit, readjustment allowances for unemployment, ended for most veterans in 1949. Nearly 9,000,000 veterans had received allowances, although most had found jobs after having been on the rolls for only a few weeks.

Medical and Hospital Benefits.—As of Sept. 1, 1955, VA was operating a network of 173 hospitals for the treatment of ill and disabled veterans. It also was utilizing some beds in civil, state and other federal hospitals on a contract basis. At that time, a total of 110,000 veterans were receiving VA hospital care. More than half were being treated for mental illnesses.

War veterans, including those with service since the war in Korea, are entitled to VA hospitalization under the following priority system, authorized by law: first, those suffering from injuries incurred in or aggravated by wartime service; and sec-

ond, those who state under oath that they are unable to pay for private treatment for nonservice-connected ailments. Veterans in the latter group must submit a financial statement listing their assets and liabilities and must wait until beds are available for them.

During 1955 VA stepped up its many-sided attack on the growing problem of providing aging veterans with the type of medical care that would enable them to lead useful lives in spite of age and disability. While only 600,000 veterans were then 65 years old or more, the number was expected to rise tenfold over the next half-century. Among the steps had been research in the use of drugs such as nicotinic acid that might overcome a common mental malady of the aged; conducting psychological studies on the characteristics and needs of the aged; and planning individual "programs of living" for veterans in domiciliary homes to add new dignity and meaning to their lives.

Compensation and Pensions.—Veterans with service-connected disabilities resulting either from wartime or peacetime service may qualify for monthly compensation payments from VA. Monthly rates range from \$17 to \$181 for wartime service; peacetime veterans receive 80% of the wartime scale. Additional statutory awards are payable to veterans with certain severe disabilities such as blindness and amputations.

Pensions may go to veterans of either World War I or II, as well as the Korean conflict period, who are totally and permanently disabled for reasons not connected with their service and whose annual incomes do not exceed \$1,400 if single or \$2,700 if married or with a minor child. Rates are \$66.15 a month, increased to \$78.75 after ten years or when the veteran reaches age 65. Those who need constant aid and attendance may get \$135.45 a month.

On Sept. 1, 1955, more than 2,600,000 veterans were receiving disability compensation and pensions. Included were 155,000 veterans disabled since Korea.

Insurance.—VA administers three systems of insurance: U.S. Government Life insurance for World War I veterans, National Service Life insurance for World War II veterans and the Indemnity and Insurance acts of 1951 for Korea veterans.

On Sept. 1, 1955, nearly 5,700,000 World War II veterans held G.I. insurance policies having a total value of \$37,700,000,000; 400,000 World War I veterans had policies valued at nearly \$5,000,000,000 and 339,000 Korea veterans had Korean G.I. term insurance totalling \$3,000,000,000.

Other Benefits.—VA administers a number of other benefits for veterans and their dependents. Among these are programs providing cars for the seriously disabled, "wheelchair housing" grants for other disabled veterans, a guardianship service and still others. (See also BUDGET, NATIONAL.) (H. V. H.)

NUMBER OF PATIENTS remaining in VA and non-VA hospitals on Dec. 31 from 1919 through 1955 by type of disability, as compiled by the Veterans administration

Veterans' Organizations, U.S. Membership in major veterans' organizations in the United States remained static in 1955 with the total figure for leading groups reported at 4,800,000, or somewhat less than the previous year.

American Legion.—The American Legion reported at the beginning of the year a membership of 2,797,000. Its 37th annual convention, held in Miami, Fla., in October, was attended by 3,164 accredited delegates and about 40,000 others. J. Addington Wagner of Battle Creek, Mich., was elected national commander. The convention gained much newspaper attention and editorial criticism when it passed a resolution calling for a congressional investigation of UNESCO.

The Legion continued its primary emphasis on veterans' benefits, and pressed on with its "New Glory for Old Glory" campaign, dedicated to increased display of the U.S. flag as the symbol of liberty, and its "Back to God" program, designed to

help reaffirm traditional moral and spiritual values. Concern for national defense and for the dangers of subversion continued, in 1955, to be among the Legion's major interests. The organization's national headquarters are in Indianapolis, Ind.

Veterans of Foreign Wars.—Timothy J. Murphy of Boston, Mass., was elected commander in chief of the V.F.W. at its 56th national encampment held in Boston in Aug. 1955. Membership was reported at about the same as the previous year, or 1,200,000. The objectives of the V.F.W. remained the same: to expand Veterans administration hospital and medical programs; to strengthen veteran preference in federal employment; to use vigilance in combatting communist infiltration and subversion in all areas of American life; to adopt universal military training; to concern itself with construction of highways, schools, hospitals and other projects in the public interest.

Disabled American Veterans.—The D.A.V. is devoted exclusively to the care of the war disabled, whether or not they are members of the organization. In 1955 it had a life membership of 70,000 and a total membership of 200,000—the highest in its history. Its new national commander was “the blind general,” Maj. Gen. Melvin J. Mass, U.S.M.C. Its 1955 convention was held in Des Moines, Ia., in August. Convention delegates reaffirmed the D.A.V.'s traditional national program of “advancing the interests of America's war disabled and their dependents.”

American Veterans of World War II (Amvets).—Membership in the Amvets continued at about 125,000 in 1955. At its national convention, held in Philadelphia, Pa., in August, Rudy Pesata of Berwyn, Ill., was elected national commander. Among resolutions passed at the 1955 meeting were those in support of the United Nations, in recommendation that court-martial board hearings be augmented by qualified psychiatrists and former prisoners of war to help in decisions and opposing a system of payment of benefits based solely upon a soldier's rank.

American Veterans Committee.—A.V.C. reported that its membership increased in 1955 to 28,000. Bill Mauldin, cartoonist and author, remained its chairman for a second year and its ninth annual convention was held in Atlantic City, N.J. A.V.C.'s slogan is “Citizens First, Veterans Second,” and its major themes include active concern for civil liberties and civil rights in the United States and for international co-operation. During the year it took a positive stand on many issues of human rights.

Other Organizations.—There were at least 25 other veterans' or veteran-related organizations operating in the U.S. in 1955, most of them regional or parochial in interest. Among the largest was the Catholic War Veterans of the United States with a membership of more than 250,000. The Jewish War Veterans of the U.S.A., one of the oldest active veterans' organizations in the country, had a membership of more than 100,000.

The World Veterans federation continued its growth in 1955. It had a total of 18,500,000 members representing 125 organizations in 31 countries. United States groups associated with the World Veterans federation were the Amvets, the American Veterans committee, the Blinded Veterans association, the Disabled American Veterans, the Military Order of the Purple Heart and the Paralyzed Veterans association. The W.V.F.'s 1955 convention was held in Copenhagen, Den. Among the major resolutions: the great powers of the world were urged to create a pattern of international co-operation in the use of nuclear energy; the four leading powers were urged to abstain from violent means in settling disputes; Asian representation should be included in the United Nations Security council; UN technical assistance to underdeveloped countries should be continued and extended; the W.V.F. should continue its unalterable opposition to discrimination on grounds of race, religion and national origin.

(Mo. Pr.)

Veterinary Medicine. During 1955 few diseases of animals made news. However, two foreign virus diseases of sheep which had first been diagnosed in the United States in 1952 were still a problem. Bluetongue, which is spread by insects and which is difficult to eradicate, was again reported from several southwestern states. It was being controlled with the aid of a new vaccine. Scrapie, the slow-developing but fatal nerve disease, was found in Iowa and again in Indiana. All of the affected and exposed sheep were immediately slaughtered. Scrapie had now appeared in 12 states from coast to coast. Signs of the disease sometimes do not appear for two or more years after exposure, so authorities were closely watching hundreds of flocks which had sheep purchased from other flocks later found to be infected.

Mucosal Diseases of Cattle.—This group, which apparently consists of two or more serious diseases that are probably caused by closely related strains of virus, were being intensively studied. They affect young cattle chiefly, producing high fever and variable lesions throughout most of the respiratory and digestive tracts. These new diseases until recently had been studied independently as “virus diarrhoea” in New York and Indiana, as “mucosal disease” in Iowa, as “upper respiratory disease” in California and as “red nose” or “necrotic rhinotracheitis” in Colorado. Some form of this disease complex had been found in at least 20 states. In some forms only a few animals in a herd may be affected, most of which die; with other forms many are affected but only a few die, although recovery may take weeks. This group presented a serious problem, not only because of the economic loss, since they show little response to treatment, but because their symptoms resemble those of the dreaded foreign cattle disease, rinderpest. Thus if rinderpest were to appear in the United States it might get quite a foothold before being positively differentiated from these diseases. There was a vaccine for rinderpest but none for the mucosal diseases.

Swine Erysipelas.—This disease, which may be either a quick killer or merely acrippler (chronic arthritis or heart valve disease), had caused serious losses to the swine industry in an increased number of states in recent years. It probably could not be eradicated since it is caused by a germ which can live in the soil or in the tonsils and other tissues of apparently normal or chronically affected animals. However, it had been fairly well controlled by vaccination for many years, using a living culture (outlawed in some states) with serum. Two new types of vaccine, a killed bacterin and a nonvirulent living vaccine, were recently introduced but their comparative value had not been determined. Erysipelas is prevalent in turkeys and also may affect man (erysipeloid) and other species.

Parakeratosis.—This chronic disease of young swine in which the skin becomes dry, wrinkled and scaly was found to be caused by a zinc deficiency. It can be prevented or corrected by increasing the zinc or reducing the calcium in the ration, or by doing both. An excess of calcium seems to interfere with the body's assimilation of zinc.

Mycoses or Fungus Diseases.—In several species of animals these were receiving increased attention. In some cases the fungus growth had been encouraged by the increased use of antibiotics which kill germs that oppose the growth of fungi. The udders of some cows had been permanently ruined by fungus infection which probably was introduced during the careless injection of antibiotics into the mammary gland.

Haemorrhagic Disease of Young Chickens.—Marked by haemorrhages in various tissues and often fatal, this disease was believed by many to be associated with the addition of various drugs to the feed in attempts to control coccidiosis or other diseases. A similar condition had been produced experimentally

by continuous feeding of certain sulfa drugs, and it had been prevented by giving vitamin K, which reduces haemorrhages by speeding up blood coagulation. However, the disease thus produced differed from the field disease, especially since vitamin K seemed to have no effect on field cases.

Psittacosis.—This virus disease of psittacine birds (parakeets, parrots) had caused a greatly increased number of respiratory infections in man in recent years. The causative agent belongs to the small group of viruses (a large type) which are susceptible to certain antibiotics. Antibiotics, therefore, were successfully used not only in the treatment of human cases but in controlling the disease in breeding colonies of birds. A similar if not identical disease in turkeys, pigeons and other nonpsittacine birds is called ornithosis. Many persons working with such birds were reported to be infected in 1954, but few if any in 1955. To prevent such infection, authorities recommended the inspection and blood testing of large commercial flocks, plus antibiotic treatment to eliminate the infection when it is found.

Feline Infectious Anaemia.—This newly recognized but widespread disease of cats is caused by a tiny organism which invades the red blood cells causing gradual weakness, loss of appetite and often a fatal anaemia. The organism (a *Bartonella*) is related to those which cause similar diseases in a few other species, such as icterohaemia or eperythrozoonosis in swine. The cat disease does not spread readily and, if treated in time, responds to blood transfusions and certain arsenical therapy.

Hepatitis X.—This noninfectious but usually fatal disease of dogs, which had been reported in several southeastern states since 1952, was found to be a chronic food poisoning. It could probably be eliminated, therefore, just as two cattle diseases were; namely X disease or hyperkeratosis and soybean-meal poisoning. In both of these, changes in feed-processing methods removed the toxic agent.

In 1955 there were 900 students graduated from the 19 schools of veterinary medicine in the United States and Canada. Freshmen in the 17 U.S. schools are required to have two years of preprofessional college training, but usually more than 25% have advanced degrees. (See also AGRICULTURAL RESEARCH SERVICE.) (W. A. A.)

Vietnam. A country forming the easternmost part of the Indochinese peninsula. Until World War II it was divided in two French colonies and the French Protectorate of Annam. After an eight-year war, civil, local and international at the same time, on July 21, 1954, Vietnam was *de facto* divided in two independent republics. Areas and populations are:

	Area (sq. mi.)		Population	
	1948	1955 (est.)	1948 (est.)	1955 (est.)
Democratic Republic of Vietnam •	126,600	63,000	22,663,000	13,000,000
National Republic of Vietnam • •		63,600		10,000,000

Three-quarters of the total population live on the coastal plain; *i.e.*, on 10% of the total territory, the Red river delta (north Vietnam) and the Mekong delta (south Vietnam) being among the world's most densely populated areas. Language: mainly Vietnamese. Religion: mainly Confucian, with three sects (Cao-Dai, Hoa-Hao and Bin-Xuyen) and a Roman Catholic minority.

Democratic Republic of Vietnam.—This comprises the former French colony of Tongking and the northern part of the empire of Annam. It is bounded on the north by China, on the west by Laos, on the south by the National Republic of Vietnam and on the east by the South China sea. Chief towns (pop., 1953 est.): Hanoi (cap.) 297,900; Haiphong (chief port) 188,600. President of the republic in 1955, Ho Chi-minh; chairman of the council of ministers, Pham Van-dong; first secretary of the Vietnamese Communist party, Truong Chin.

National Republic of Vietnam.—A member of the French

Union, it comprises the former French colony of Cochinchina and the southern part of the empire of Annam with its old capital Hué. It is bounded on the north by the Democratic Republic of Vietnam, on the west by Laos, Cambodia and the Gulf of Siam, and on the southeast and east by the South China sea. Chief towns (pop. 1953 est.): Saigon-Cholon (cap.) 1,614,200; Dalat 25,041. President of the republic and premier in 1955, Ngo Dinh Diem.

History.—By May 13, 1955 the evacuation of French forces from Haiphong was completed; troops of the Democratic Republic of Vietnam then marched in. Compensation was paid by the republic for the Tongking coal-working installations. France was represented in northern Vietnam by a high commissioner (Jean Sainteny) and still maintained the Institut Pasteur, The École Française d'Extrême-Orient and a lycée there. Of the 810,000 people who left northern Vietnam for the south, 300,000 were members of the armed forces, 10,000 French civilians, 470,000 Vietnamese civilians and the remaining 30,000 Chinese or Indian civilians. A Thai-Meo autonomous region was created. The Vietnamese railway system was linked with the Chinese by a line through Langson. Ho Chi-minh spent June and July in Peking and in Moscow, securing a promise of help in the form of money, equipment and foodstuffs to save his country from famine. China agreed to an 800,000,000 yuan (\$338,000,000) economic aid, while the U.S.S.R. made a gift of 400,000,000 roubles (\$100,000,000).

In September Pham Van-dong became prime minister and Ngo Nguyen-giap deputy prime minister, Ho Chi-minh remaining president of the republic.

Southern Vietnam was still distracted by the rivalry between the prime minister Ngo Dinh Diem, the religious sects and the emperor Bao Dai, who was still wielding his influence from his residence in France. In March the ministers representing the sects left the government, and fighting broke out in Saigon between Diem's troops and the Bin-Xuyen. In May, Diem convened a general assembly, which split into two sections, while a committee of the forces of revolution demanded the deposition of Bao Dai. On May 7 the Bin-Xuyen evacuated Saigon; but military operations against them and against the Hoa-Hao still went on in the rural areas. The third sect, that of the Cao-Dai, was divided into two factions; and in October a general of the sect deposed the "pope." Though still receiving some economic aid from France, Diem seemed to rely more and more on U.S. support. During the fiscal year 1955-56 U.S. aid amounted to \$320,000,000, of which 73% went to military, 18% for refugees and 9% for technical and economic assistance.

Diem proclaimed his intention of avoiding the referendum that the Geneva conference of the heads of the Big Four Powers had declared to be due in 1956. In October he recalled his delegation from Paris. When Bao Dai "dismissed" him (on the grounds that he had made himself dictator and rejected the unification of Vietnam), Diem retorted by organizing a referendum that deposed Bao Dai. (HU. DE.)

Education.—*Cambodia.* Schools: primary (1952) 2,170, teachers 4,770, pupils 174,444; secondary, including teachers' training schools (1954) 8, pupils 2,945, teachers 140; vocational (1952) 2, teachers 11, pupils 108. Institutions of higher education 4, including the National Institute of Law and Economics with 81 students in 1950. *Laos.* Schools (1953-54): primary 558, pupils 33,577 (excluding 185 schools closed in areas affected by the war); secondary (including 1 teachers' training) 7, pupils 1,142. *Vietnam.* Schools (1954): primary 3,138, pupils 58,121, teachers 11,063; secondary (including technical) 182, pupils 53,842, teachers 1,597; 1 teachers' training school, students 53. Institutions of higher education 5, including 1 university with 2,260 students and 67 teachers.

Finance.—Under the Paris agreements of Dec. 24, 1954, the piastre (called *real* in Cambodia and *jip* in Laos) was to remain provisionally equal to 10 metropolitan francs until Dec. 31, 1955, when its parity was to be decided unilaterally. (U.S. \$1=350 francs.)

Budgets. *Cambodia* (1953 est.) balanced at 114,000,000 piastres. *Laos* (1954), balanced at 632,212,520 piastres. *Vietnam* (1954): revenue 15,092,000,000 piastres; expenditure 50,372,000,000 piastres.

Foreign Trade.—(1954) Imports 121,950,000,000 fr., including 42,000,-

RESIDENTS OF HAIPHONG, Vietnam, holding banners as they awaited the arrival of pro-communist Vietminh occupation troops in May 1955

000,000 fr. from France; exports 33,780,000,000 fr., including 6,000,000,000 fr. to France, 4,000,000,000 fr. to rest of French Union, 8,000,000,000 fr. to the United States, 3,000,000,000 fr. to Japan.

Production.—(Metric tons, 1954): sugar 1,000; rice (*Cambodia*) 815,000, (*Vietnam*) 2,562,000 (*Laos*, 1952) 500,000; rubber (*Cambodia* and *Vietnam*) 79,320, (*Cambodia* 24,400); coal (*Vietnam*) 996,000; cement (*Vietnam*) 254,400; (1953): tin concentrates (Sn content, *Laos* and *Vietnam*) 268,000; sawn softwood (*Vietnam*) 27,000 cu.m.; sawn hardwood (*Cambodia* and *Vietnam*) 258,000 cu.m.; (1952, metric tons), tobacco (*Cambodia*) 4,500, (*Laos*) 1,000, (*Vietnam*, 1953) 7,400; maize (excluding *Laos*) 97,000.

Virginia. One of the 13 original states of the United States, Virginia was admitted to the union June 26, 1788; it is known as the "Old Dominion" and as the "Mother of Presidents." Southernmost among the middle Atlantic states, Virginia has an area of 40,815 sq.mi., including 922 sq.mi. of water. Pop.: (July 1, 1955, est.) 3,421,000; (1950 census) 3,318,680. Principal urban areas include the capital, Richmond, pop. (1950) 230,310, Norfolk 213,513, Arlington county 135,449, Roanoke 91,921 and Portsmouth 80,039. Once a predominantly agricultural state, Virginia is becoming steadily more urban; in 1940 farm population was 983,746 or 36.7%; by 1950, this had dropped to 732,000 or 22.2%.

History.—The year 1955 was an off year for the general assembly, which meets in regular biennial session in even-numbered years.

The governor's Commission on Public Education, consisting of 32 legislators, which had been set up to search for a policy the state could follow to meet the United States supreme court's ban on racial segregation in public schools, issued its report in November. It called for a wide degree of local option in dealing with the segregation problem. Under its proposals, localities would classify pupils by a variety of standards other than race or colour if they chose to continue public-school operation. Such schools would function as desegregated institutions.

For localities unwilling to operate desegregated public schools, the commission recommended a tuition grant program for individual school-age children, white and Negro. Those eligible for the grants would be expected to use them for studies in any private, accredited school of their choice. Constitutional changes were proposed to permit those grants to be made.

Gov. Thomas B. Stanley issued a call for a special session of the legislature to convene on Nov. 30 for the specific purpose of setting in motion the convening of a constitutional convention. The convention, in turn, would be limited to amending the constitution to permit the appropriation of public funds for private educational tuition grants.

Two important study groups were at work on proposed legislation. One, composed of legislators and private business executives, recommended that the state appropriate \$109,000,000 during the next six fiscal years for capital projects, with \$43,000,000 of this sum to be allotted to the improvement of mental hospitals, \$36,000,000 to expansion of institutions of higher learning, \$9,800,000 to construction and reconstruction of penal institutions, \$9,000,000 to enlargement of two state medical schools and lesser sums to other state agencies. The Capital Outlay Study commission proposed that this building program be financed out of expected revenues from existing taxes, coupled with an accelerated payment plan that would put income taxpayers on a more nearly current basis and permit Virginia initially to collect taxes for two years in a single 12-month period.

Principal officers of the government, all of whose terms were to expire in Jan. 1958, were: Thomas Bahnson Stanley, governor; A. E. S. Stephens, lieutenant governor; and J. Lindsay Almond, Jr., attorney general.

Education.—In 1954-55 elementary school enrolment was 540,537, including 402,199 white pupils and 138,338 Negro pupils. Secondary enrolment was 183,938, made up of 143,046 whites and 40,892 Negroes. The elementary-school teaching staff included 15,607 positions, the secondary and vocational staff 8,649 positions. In addition, there were 2,409 principals, head teachers and supervisors. Dowell J. Howard was state superintendent of public instruction.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ended June 30, 1955, general relief payments went to 10,857 persons and totalled \$1,137,145; 20,832 persons received \$6,167,343 in old-age assistance payments; 12,852 families with 38,359 dependent children received \$6,848,098; 6,965 children under the foster care program got \$1,769,330; 6,085 totally and permanently disabled persons were paid \$2,091,986; and 1,522 blind persons got \$558,101. For the first ten months of 1955, 482,000 weekly payments were made for unemployment compensation, totalling \$8,851,765. Average daily population of six penal institutions for adults was 5,990 and of four industrial schools for juveniles was 784 at the close of the fiscal year ended June 30, 1955.

Communications.—As of June 30, 1955, Virginia had 7,984.66 mi. of primary highways and 40,638.13 mi. of secondary roads. During the June 30, 1955, fiscal year the state spent \$90,216,792 for construction, maintenance and operation of its highway systems, compared with \$88,098,208 for this purpose in the preceding 12-month period. Total railroad mileage in the state on Jan. 1, 1955, was 4,109.88. Virginia had 925,000 telephones in use as of Sept. 30, 1955.

Banking and Finance.—On June 30, 1955, Virginia had 185 state banks with 92 branches and 132 national banks with 73 branches. As of this date, deposits in national banks were \$1,420,830,000 and assets totalled \$1,551,662,000. At the same time, deposits in state banks amounted to \$1,065,534,000 and assets came to \$1,171,429,000. Resources on Dec. 31, 1954, of 20 industrial loan associations were \$31,600,000; of 45 building and loan associations were \$118,160,000; and of 73 credit unions were \$5,652,000.

For the fiscal year ended June 30, 1955, the state treasurer received revenues of \$415,285,633, compared with \$403,915,301 for the year before. Expenditures of the treasurer were \$411,240,662. The gross debt on June 30, 1955, was \$10,824,352; a sinking fund of \$4,429,705 left a net debt of \$6,394,646. The fiscal year ended with cash in the general fund amounting to \$44,408,967, along with investments valued at \$1,754,800.

Agriculture.—Unusual weather conditions throughout the 1955 growing season constituted generally unsettling factors for Virginia farmers. Unseasonably early frosts in the spring killed the blossoms in apple and peach orchards in many sections, forecasting drastic reductions in yield before the fruit could form. Generally good rainfall later in the year

Table I.—Principal Crops of Virginia

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	34,827,000	30,063,000	37,806,000
Wheat, bu.	6,171,000	6,936,000	7,851,000
Oats, bu.	6,992,000	7,070,000	4,217,000
Rye, bu.	374,000	408,000	343,000
Barley, bu.	3,990,000	3,978,000	2,535,000
Tobacco, lb.	177,564,000	166,458,000	158,699,000
Peanuts, lb.	209,050,000	174,900,000	207,413,000
Hay, all, tons	1,868,000	1,472,000	1,612,000
Apples, bu.	5,500,000	12,900,000	9,025,000
Peaches, bu.	315,000	1,200,000	1,533,000
Cotton, bales	12,000	10,200	18,300
Irish potatoes, bu.	6,369,000	4,789,000	7,775,000
Sweet potatoes, bu.	3,045,000	2,800,000	2,560,000
Soybeans, bu.	3,354,000	2,898,000	2,078,000

Source: U.S. Department of Agriculture.

ended three consecutive drought periods and helped raise the quantity and quality of tobacco, peanuts, corn, soybeans and potatoes brought to market. Hurricanes in late summer and early fall brought much-needed moisture to many areas, although wind damage and floods somewhat dimmed prospects for corn, tobacco and orchard yields in other sections. The total value of crops for 1954 was calculated by the Virginia department of agriculture at \$541,815,000, with livestock accounting for \$311,551,000 of this sum and general farm crops making up the remainder.

Manufacturing.—The value of products manufactured in Virginia in 1954 totalled \$4,347,220,000, according to estimates of the state department of labour and industry on the basis of reports from 2,000 manufacturing plants out of the 4,500 establishments in the state. The reporting firms accounted for 85% of the estimated total manufacturing employment in the state. The value reported represented a decline from the \$4,490,773,000 reported by the department for 1953. The number of persons engaged in manufacturing activities in 1954 was placed at 242,000; they were paid \$780,074,000; \$595,718,000 went to 206,600 production workers and \$184,356,000 went to 35,400 salaried and supervisory employees.

Lime	477,000	4,947,000	443,000	4,449,000
Sand and gravel	5,276,000	5,161,000	7,136,000	5,557,000
Stone	9,092,000	16,259,000	9,671,000	16,970,000
Zinc	17,000	3,835,000	13,000	4,452,000
Other minerals	19,097,000	...	16,173,000
Total		\$152,777,000		\$164,679,000

*Values for processed materials are not included in the totals.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Virginia in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953 Virginia was second among the states in output of kyanite and pyrite and third in ilmenite and manganese; and ranked 21st in the value of its mineral output with 1.06% of the U.S. total.

Virgin Islands. The Virgin Islands have the status of an organized but unincorporated territory of the United States, located 1,400 mi. southeast of New York city and 40 mi. east of Puerto Rico. The three largest islands, with a total area of 133 sq.mi., are St. Croix (pop. 12,103, census of 1950), St. Thomas (13,813) and St. John (749). The chief cities are Charlotte Amalie, the capital (11,469), on St. Thomas, and Christiansted (4,112) and Frederiksted (1,961) on St. Croix. On July 1, 1954, the U.S. census bureau estimated the total population at 22,000.

History.—On Aug. 10, 1955, Gov. Archibald A. Alexander resigned, and on Aug. 19 Pres. Dwight D. Eisenhower appointed Walter A. Gordon of Berkeley, Calif., to succeed him. Other ranking officials in 1955 were: government secretary, Charles K. Claunch, a native of Chicago, Ill.; administrative assistant to the governor, George W. Hamilton; U.S. attorney, Leon Miller; and judge of the district court, Herman E. Moore.

With the passage of public law 517 in 1954, the pattern of government financing in the Virgin Islands was changed. The government of the Virgin Islands is now financed jointly by the local revenues collected and by federal matching funds. The matching funds are taxes imposed by and collected under the

provisions of the internal revenue laws of the United States on articles produced in the Virgin Islands and transported to the United States. These matching funds are paid over to the government of the Virgin Islands during the fiscal year, as certified by the comptroller of the Virgin Islands. In addition, a separate amount is paid over to the Virgin Islands to be obligated and expended for emergency purposes and essential public projects only.

Education.—Education is compulsory for all children between the ages of 5½ and 15. In the three islands there were 32 public schools in 1955, consisting of 7 kindergartens, 15 rural schools, 7 city elementary schools, 1 junior high school and 2 junior-senior high schools. Total enrolment in public schools was 5,639. The school budget for the year was \$716,381. The per capita cost of \$217 represented an increase of \$32 more than the preceding year.

Banking and Finance.—Total revenue for the fiscal year ending June 30, 1955, from real property taxes, income taxes, matching funds and grant-in-aid funds, amounted to \$6,678,196. There are two banks in the Virgin Islands. The Virgin Islands National bank had assets of \$10,649,578.13 as of June 30, 1955, and on the same date the West Indies Bank and Trust company had assets of \$3,301,648.48.

Trade and Communications.—For the 11-month period July 1954 through May 1955, the value of exports was \$3,713,886; imports were \$11,786,060. During the year ended June 30, 1955, income from tourists was estimated at \$6,000,000. In 1955 there were in St. Thomas and St. John: highways, 90 mi.; motor vehicles, 1,738; airports, 1; air lines, 3; telephones, 1,360. In St. Croix there were: highways, 150 mi.; motor vehicles, 1,309; airports, 1; air lines, 2; telephones, 627. There were four newspapers in the Virgin Islands.

There was daily air mail and passenger service between St. Thomas and St. Croix and daily boat mail and passenger service between St. Thomas and St. John, and cable offices in St. Thomas and St. Croix.

Social Services.—Total public assistance payments for the fiscal year 1954-55 amounted to \$254,701. This included old-age assistance \$136,564.37; aid to dependent children \$65,325.17; aid to the blind \$7,193.32; aid to the disabled \$19,968.38; general assistance \$16,968.38; trust funds monthly grants \$990; emergency and special aid \$8,089.14. The average monthly payments per recipient were: for old-age assistance \$18.56; aid to the blind \$18.36; aid to the disabled \$19.27; general assistance \$18.37; aid to dependent children \$9.36 per person, in families with children.

Three homes were maintained for the aged and indigent, and (since 1954) one school for delinquent boys.

Vitamins and Nutrition. Vitamin Supplementation and Physical Performance.

—Human emotions and behaviour as well as physical status are influenced by poor nutrition. However, the possibility that beneficial effects may be derived by the administration of exceedingly large amounts of vitamins to subjects on diets adequate enough to prevent the development of clinical or subclinical deficiency states is subject to question. The relation of nutrition and of vitamin supplementation to physical performance is of special interest to the armed forces. R. Ryer *et al.* reported in 1954 on studies designed to determine whether the functional abilities of the soldier in a cold environment might be improved by supplements of ascorbic acid and of B-complex vitamins. Eighty-six military personnel volunteered as test subjects. The experiments were carried out during the winter season at an elevation of 8,300 ft. above sea level. The subjects were randomly divided into two groups. The control group (42 men) received a capsule containing 6 mg. of ascorbic acid four times a day. The supplemented group (44 men) received four times a day a capsule which contained thiamine (10 mg.), riboflavin (10 mg.), niacinamide (100 mg.), calcium pantothenate (80 mg.), pyridoxine (40 mg.), folic acid (2.5 mg.), ascorbic acid (300 mg.) and vitamin B-12 (4 micrograms). After a control period to allow the subjects to adjust to the prescribed conditions of diet, physical activity and clothing, and to the cold and the altitude, weekly measurements of physical performance

were made. During the first six weeks of the experiment the caloric intake averaged 3,500 cal. daily. The calories were restricted to 2,250 cal. daily during the last three weeks of the study. The clothing worn for outdoor activities was restricted to less than the amount required for comfort when inactive under the prevailing conditions.

There was no significant difference between the two experimental groups with regard to results of the physical performance tests. The relative caloric deficit of the last three weeks did not lead to detectable impairment of physical performance. The supplemented group showed a lesser (but statistically significant) fall in rectal temperature during exposure to the cold while at rest than did the controls. No differences were revealed between the two groups in six psychological tests and in biochemical measurements of urinary nitrogen excretion, blood glucose, haemoglobin, creatinine excretion and 17-ketosteroid excretion. The supplemented group demonstrated the expected increases in blood and urine levels of ascorbic acid, and both groups excreted increased amounts of oxidized ascorbic acid during exposure to cold. These experiments failed to demonstrate any improvement in physical or mental performance in soldiers undergoing physical activity in the cold by the addition of large doses of B-vitamins and of ascorbic acid to a ration adequate enough to maintain level of performance and to prevent clinical nutritional deficiency states. Vitamin supplementation appears to be ineffective in increasing the efficiency of an adequate diet consisting of natural foodstuffs which takes into account the total energy requirement of an individual in assuring maximal physical performance.

Vitamin B-12.—Most vitamins are readily absorbed from the intestine of man. However, vitamin B-12 absorption is a much more difficult process, requiring the presence of a special component of gastric juice (intrinsic factor). Even in the presence of normal amounts of intrinsic factor the intestinal absorption of vitamin B-12 may be surprisingly limited. B. J. Jerzy Glass and associates studied the effect of the size of the dose of vitamin B-12 (labelled with radioactive cobalt) on the degree of intestinal absorption. Using 20 normal individuals or patients with "irrelevant" disorders, the amount of radioactivity accumulated by the liver following oral administration of increasing doses of vitamin B-12 was compared with that which took place after similar doses of the vitamin given intramuscularly. With increasing oral doses of vitamin B-12 there was a rapid and progressive fall in absorption. The liver uptake following an oral dose of 0.5 micrograms of vitamin B-12 was 90.5% of that which occurred following the intramuscular injection, while only 3% as much liver accumulation took place with oral as compared with intramuscular administration with doses of 50 micrograms. An increase in the oral dose of vitamin B-12 from 0.5 to 50 micrograms only resulted in an increase in liver accumulation from an estimated 0.45 to 1.5 micrograms daily.

The authors interpreted their results as indicating that a partial mucosal block exists for the absorption of B-12. Unpublished data were cited which indicate that the failure to absorb greater amounts of vitamin B-12 cannot be corrected by the administration of additional intrinsic factor. Present information suggests that the absorption of vitamin B-12 by the human intestine is a complicated process involving the presence of a facilitating substance (intrinsic factor) and possibly an intestinal acceptor substance.

Vitamin A and Carotene in the Aging.—Although there had been a number of longitudinal nutritional studies of children and young adults, there were relatively few which encompassed older people. One such study attempted to correlate health over a period of time with nutrient intake and included

as subjects more than 500 supposedly healthy men and women over 50 years of age living in San Mateo county, Calif. One phase of the study concerned with correlations which might exist between dietary vitamin A and carotene intake and status as indicated by circulating blood levels and the presence or absence of the stigmata of deficiency or excess was discussed by H. L. Gillum and coworkers. Of the 514 subjects who participated in this study all were living in their own homes except 44 men over 60 years of age who were living in the county home. A small decline in both vitamin A and carotene serum levels occurred with age in both men and women. No significant sex differences were found. The probable vitamin A equivalent of the dietary intakes was determined and amounted to 33 micrograms per kilogram of body weight for the men living in their own homes, 27 for the women and 21 for the men in the county home. About 11% of the men and 20% of the women took vitamin A supplements more or less regularly. A slight positive correlation was established between total vitamin A intake and serum vitamin A level for both men and women. The correlation between serum carotene and carotene intake was more pronounced. Thickening of the bulbar conjunctiva which occurred in 94% of the subjects and other changes in the conjunctiva and skin were not more marked in subjects with low serum levels of vitamin A than in those with high levels. The relationship of age to the distribution of these signs was more marked than to vitamin A levels or intakes. In spite of a generous intake of vitamin A maintained by the majority of the older subjects, the findings of the study showed a trend toward a lowering of these levels with age.

Riboflavin and Stress.—Clear-cut physiologic response (the so-called stress response) occurs in animals following a variety of stimuli such as exposure to cold, heat or high altitude in the presence of a functioning adrenal cortex. An increased rate of gluconeogenesis (glucose formation) is one of the biochemical manifestations of the stress response. The importance of riboflavin to this response was clearly demonstrated in a report of B. R. Forker and A. F. Morgan. Weanling Long-Evans rats were exposed to low oxygen tension (anoxia) as the stress factor and the increase of liver glycogen (which reflects gluconeogenesis) in the fasted animal was used as the criterion of response. The animals were given a purified diet with and without riboflavin. Animals subjected to anoxia were fasted for 24 hours in a specially designed chamber with oxygen tension to simulate 20,000 ft. altitude. Their livers were then analyzed for glycogen and compared with the glycogen levels of rats which were fasted at sea-level oxygen tensions. The purpose of the preliminary experiment was to study the effect of time on the riboflavin-deficient diet on the response to anoxia. After approximately three weeks of feeding the animals receiving the deficient diet gave essentially no gluconeogenic response to anoxia while animals receiving riboflavin demonstrated approximately a tenfold increase in liver glycogen in response to anoxia.

The effect of the adrenal hormones and of a single injection of riboflavin on the response to anoxia was studied in a second experiment. The deficient animals again failed to respond; however, the injection of 0.1 mg. of riboflavin into the deficient animals immediately before the test resulted in restoration of the gluconeogenic response to the stress. A similar effect followed the administration of adrenal cortical extract or cortisone to the riboflavin-deficient animals. Desoxycorticosterone was without effect. Likewise adrenalectomized rats receiving the complete diet failed to respond to the anoxia.

These experiments demonstrated that the adrenal glands or their hormones were necessary for the gluconeogenic response to anoxia since adrenalectomized animals failed to respond even though fed a complete diet. The riboflavin effect was not the

result of a failure of the target tissues to respond to the hormones since the riboflavin-deficient animals responded to cortisone or complete cortical extract.

It may be concluded that riboflavin is required either for synthesis of the adrenal hormones or else it functions in the mechanism concerned with their elaboration. The vitamin may function in a direct way since riboflavin was effective when injected into the deficient animals immediately before the test. (See also NUTRITION, EXPERIMENTAL.)

Wages and Hours. Reversing the previous year's tendency, real wages in the U.S. in 1955 rose from 5.6% to 8.2% for corresponding months in 1954. The high index in 1955 of 166.5 was 3.1% above the 1954 high of 161.5, based on 1939 averages (see Table I).

The general improvement in the level of business operations in 1955 caused an increase of 6.6% in manufacturing employment over 1954 (July figures). During the same period, manufacturing payrolls increased 14.9%. Total wage and salary payments moved from the \$16,241,000,000 level in June 1954 to \$17,250,000,000 in June 1955, which was an increase of 6.2%.

Average weekly earnings for all manufacturing industries increased 7.7%, while the cost of living (consumer's price index) moved from a 1954 high of 193.8 to a 1955 high of 193.0, which represented a drop of 0.41%. Earnings in nonmanufacturing industries increased in all but anthracite coal mining, where the decline was 5.9%.

The greatest increase in weekly take-home pay was in bituminous coal mining, where the average went up by 17.6% over 1954. The next highest increase, 14.7%, was in iron and steel, followed by a 12.3% increase in rubber products. Smallest increases in average weekly earnings were in general merchandise stores (0.6%) and leather and leather products (1.3%).

An upsurge in investment in capital goods resulted in an 8.4% increase in average weekly earnings in the durable goods industries, while earnings in nondurables increased 4.9%.

Earnings exceeded \$90 per week in six industries, compared with only three industries in 1954. Ten industries paid average weekly earnings exceeding \$80 and six industries less than \$60 in 1955.

The length of the average work week dropped in six industries in 1955, but in three of these the decline was less than 1%.

"IS LUCKY YOU ARE WORKING HERE, COMRADE WORKERS . . . Capitalist slave workers in U.S. work only 40 hour week . . . HERE is no such unemployment . . ." a 1955 cartoon by Lichty of the Chicago Sun-Times Syndicate

In the previous year, average weekly hours dropped in all but three industries. The longest work week in 1955 was in street railways and buses. The general pattern of increases in average weekly hours meant more overtime pay, which contributed to the rises in weekly earnings in several industries. Workers in 19 industries worked more than 40 hours per week.

Anthracite coal mining had the shortest work-week average (34.5 hours), followed by general merchandise stores (35.2 hours) and apparel manufacturing (36 hours).

Highest average hourly earnings were paid in the building construction industry (\$2.64), followed by \$2.53 in bituminous coal mining and \$2.33 in iron and steel. Fourteen industries paid average hourly earnings of more than \$2, compared with 11 industries in the preceding year.

Hourly rates of pay increased in all industries in 1955 except two. These were anthracite coal mining (which showed a decline of one cent, or 0.4%) and apparel (which also declined one cent, or 0.7%). The greatest proportionate gains in hourly rates were in lumber and wood products (10.3%), furniture and fixtures (10.2%), rubber products (7.7%) and stone, clay and glass (5.6%). The lowest monetary rate paid was 99 cents in hotels (not including tips, board, room or uniforms), but this was 4 cents higher than in 1954. For manufacturing as a whole, the increase in hourly rates was 5.0% compared with 1.7% in 1954 and 6.6% in 1953.

Table III shows a five-year climb of 29.9% in hourly earnings for all manufacturing industries. The greatest improvement over the five-year span was one of 46.3% in iron and steel. The industry showing the weakest increase over the five-year period was textile products (12.3%), followed by automobiles and lumber and allied products, both of which increased 24.5% from 1950 to 1955.

Common labour in road building in July 1955 received an average hourly rate of \$1.72, compared with \$1.51 in 1950. This represented an increase of 13.9%. Farm wages were up one cent

In summary, 1955 wage payments reflected the fillip experienced in general business activity. This also was true in manufacturing employment as well as in average hourly and weekly earnings. (See also AGRICULTURE; BUILDING AND CONSTRUCTION INDUSTRY; BUSINESS REVIEW; LABOUR UNIONS; LAW; PRICES.)

Warren, Earl (1891—), U.S. jurist, was born on March 19 at Los Angeles, Calif. He was graduated from the University of California, Berkeley, in 1912, and received his law degree in 1914. During World War I he served in the army, and from 1925 to 1938 he was district attorney of Alameda county in California. In the latter year he was elected attorney general of California. He won a reputation as a "racket buster" and in 1942 was elected governor of California. In 1946

he shattered precedent in the state by winning both the Republican and Democratic nominations in the June primaries, making his re-election assured. He ran as vice-presidential candidate on the G.O.P. ticket with Thomas E. Dewey in 1948, but lost in the unexpected Democratic national victory.

Warren was elected to his third term as governor of California and took office in Jan. 1951. At the Republican national convention in Chicago, Ill., July 11, 1952, Warren received 81 votes on the first and only ballot, which nominated Dwight D. Eisenhower.

On Sept. 30, 1953, President Eisenhower selected Warren as the 14th chief justice of the United States, succeeding Fred M. Vinson. He was confirmed by the U.S. senate on March 1, 1954 (having been sworn in the previous Oct. 5 while the senate was not in session).

In May 1954 Chief Justice Warren read the decisions, which he had written himself, and which reflected the unanimous opinion of the court, that public school racial-segregation laws in the United States were unconstitutional. On May 31, 1955, however, the court in a decision written by Warren set no specific deadline for the end of segregation, except that it should be accomplished "with all deliberate speed."

Warren on April 15, 1955, declared that he had left politics permanently to serve on the supreme court bench and would decline any nomination to the presidency.

Washington. A state in the extreme northwestern United States, popularly known as the "Evergreen state," Washington was admitted to the union Nov. 11, 1889. Total area: 68,192 sq.mi., of which 66,786 sq.mi. is land. Pop. (1950) 2,378,963; native white 2,125,495, foreign-born white 191,001, Negro 30,691 and other races 31,776. According to the U.S. bureau of the census estimate, the state's total population on July 1, 1955, was 2,497,000. In 1950 the urban population was 1,503,166 or 63.2% of the total population. The population of five largest cities, according to April 1, 1955, estimates (1950 figures in parentheses) were respectively: Seattle 555,000 (467,591); Spokane 182,000 (161,721); Tacoma 156,000 (143,673); Yakima 43,000 (38,486); Vancouver 41,950 (41,664). State capital, Olympia 17,200 (15,819).

History.—The state legislature met in its 34th regular session from Jan. 10 to March 10, 1955. For the third successive legislative year, the governor called the legislature to reconvene in extraordinary session which deliberated from March 11 to March 24. The department of public institutions was divided into the department of general administration and department of institutions. Ratification and approval was given the Western Regional Higher Education compact, whereby the 11 western states should co-operate in pooling facilities for graduate and professional education. A new law relating to subversive activities was passed, but its operation at the University of Washington, Seattle, was suspended when it was challenged in the courts by two professors.

At the special session, concerned chiefly with the budget and revenue bills, the retail sales tax was increased from 3% to 3½%, and special provisions in the form of use and transfer taxes were made to check circumvention. The governor, employing the item veto, eliminated the appropriation for kindergartens on the ground that public opinion did not favour state support and that the amount provided was inadequate and of no help to poorer districts. In response to the urgent suggestion of the governor, the state building program and its financing were placed under the administration of a state building financing authority consisting of the governor, state treasurer and the director of general administration. The authority of the Washington-Oregon Boundary commission, created in 1937 to secure

data necessary to determine a definite boundary between the two states in the lower Columbia river valley, was extended.

The state supreme court upheld the constitutionality of three laws. One, a fisherman's license law of 1953, forbids the sale and disposal of chinook or silver salmon caught in off-shore waters during closed season. Another, the slash responsibility law of 1951, charges the cost of fighting fires caused by slash burning to the owners of timber or persons responsible for the fire hazard. Also held valid was the law of 1951 which requires that in cities of more than 5,000, justices of the peace must be attorneys.

On Nov. 4 the state supreme court by a vote of 7 to 2 held unconstitutional the act creating the state building authority. This held in suspension a \$12,000,000 building program authorized by the legislature.

The chief state officers for 1955 were: governor, Arthur B. Langlie; lieutenant governor, Emmett T. Anderson; secretary of state, Earl S. Coe; treasurer, Charles R. Maybury; auditor, Cliff Yelle; attorney general, Don Eastvold; state superintendent of public instruction, Pearl A. Wanamaker (elected on non-partisan basis); commissioner of public lands, Otto A. Case; state insurance commissioner, William A. Sullivan; and chief justice of the state supreme court, Frederick G. Hamley.

Education.—On Oct. 1, 1954, the enrolment in public elementary schools was 309,067, in secondary schools 98,362, and in junior high schools 60,699, and the average daily attendance during the school year 1954-55 in these schools was 309,399, 88,457 and 59,033 respectively. The total number of teachers was 20,295 and the average salary of all certified personnel was \$4,422.47. Total current expenditures were \$134,683,450.13 and the cost per pupil in attendance was \$292.03. Institutions of higher education included the University of Washington, the State College of Washington, three state colleges of education, nine junior colleges, integrated with the secondary school program but operated with state funds, and 13 privately endowed universities and colleges in the state.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the period Sept. 1, 1954, to Aug. 31, 1955, inclusive, public assistance in the state, including federal expenditures and state aid, cost \$78,227,956.08. An average of 122,771 persons received assistance to a total amount of \$71,335,681.01. An average of 20,550 received a total of \$7,901,220.56 in general assistance. An average of 62,204 old persons received a total of \$44,358,742.36. An average of 30,192 dependent children received a total of \$11,393,501.04. A total of \$2,211,492.84 was provided for the foster care of an average of 3,529 children. An average of 844 blind persons received a total of \$729,129.68. A total of \$4,740,314.50 in disability payments was paid to an average of 5,886 persons. A total amount of \$651,126.21 was provided for public assistance service, of which \$98,698.82 was extended to the blind and \$535,373.49 was provided for burials. Administration of the entire program cost \$6,239,813.50.

On June 30, 1955, 10 state charitable institutions had a total population of 11,477 and 5 correctional institutions had a total of 2,755. The total expenditures of both programs, excluding Cedar Creek Youth Forestry camp, for the fiscal biennium ending March 31, 1955, were \$27,492,233.28.

Communications.—Railroads in the state during 1954 carried freight to a total of 7,746,802,997 ton miles, and passengers to a total of 317,967,295 passenger miles. There were 5.895 mi. of track.

On Jan. 1, 1955, the total mileage of highways in Washington was 45,712 of which 10,640 mi. were federal aid highways. Total state expenditures for state highways during the period Feb. 1, 1954, to Jan. 31, 1955, were \$56,318,144. There were 880,422 telephone instruments in service Dec. 31, 1954.

Banking and Finance.—In 1955 the state board of equalization placed the value of real and personal property at \$6,295,076,322 and equalized it for purposes of taxation at \$3,142,538,161. The bonded indebtedness was \$52,363,000 and outstanding warrants amounted to \$22,852,049.67. For the year ending June 30, 1955, receipts, including cash and warrant transfers, were \$660,612,797.09 and disbursements, including cash and warrant transfers, were \$701,513,348.05. The treasurer's cash balance was \$74,233,409.96 on June 30, 1955.

On that day there were 113 banks, including four mutual savings banks, reporting a total capital of \$51,005,000; capital surpluses, undi-

vided profits, and reserves of \$190,000,000; deposits \$2,582,114,000; and total assets of \$2,797,045,000.

Agriculture.—According to the preliminary census figures of 1954 (1955 figures in parenthesis) the number of farms in the state, 65,175 (69,820), decreased since 1950, but the total area of farm land, 17,641,429 ac. (17,369,245 ac.), increased as did the average size, 270.7 ac. (248.6 ac.), as well as the average value, including buildings, \$29,006 (\$20,744). In 1955, the total value of farm land and buildings was placed at \$1,510,006,000 and the average value per acre at \$86.93. Crop land harvested in 1954 was reported as 4,342,833 ac. In that year the total value of farm production was \$631,443,000, of which \$274,594,000 represented field crops, \$193,396,000 livestock and products, \$113,782,000 fruit, nut and berry crops, \$28,340,000 specialty crops, and \$21,331,000 vegetable crops. Receipts from marketings amounted to a total of \$563,816,000, of which \$385,717,000 was from crops and \$178,099,000 from livestock and products. Government payments were \$4,459,000.

Manufacturing and Trade.—In 1953 the value added by manufacture was \$1,482,007,000, the total number of employees in manufacturing throughout the year was 190,214 and their total salaries and wages amounted to \$823,147,000. The average annual labour force during 1954 was 991,100, of which an average of 927,300 were employed. Domestic workers numbered 17,100; agricultural workers 85,200; and nonagricultural workers

*Withheld because the estimate did not meet publication standards, either on the basis of the associated standard error of estimate or on the basis of a consistency review.

842,100. Manufacturing establishments employed 188,900, the wholesale and retail trade 164,200, the service industries 81,900, the transportation companies and utilities 62,900 and government 146,200.

The output of lumber in 1954 was 3,374,000,000 bd.ft. (estimated); pulp production 2,377,000 tons; and plywood production for the Pacific northwest was 3,824,000,000 sq.ft.

The salmon pack for the Puget sound and Columbia river districts was 922,000 cases in 1954 as compared with 962,000 in 1953.

For the year 1954 the Washington customs district reported total exports of \$257,994,141 and total exports for consumption of \$234,233,226. (H. J. De.)

Total	\$56,139,000	...	\$54,577,000

*Values for processed materials are not included in the totals.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Washington in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953, Washington ranked first among the states in output of magnesite, and fourth in diatomite; and ranked 31st in the value of mineral output, with 0.38% of the U.S. total.

Washington, DISTRICT OF COLUMBIA, the capital of the United States, is administered by a commission of three appointed by the president, and, under the constitution, all legislation is passed by congress. Since the 1950 census the population of the district had grown rapidly and in 1955 reached 840,000, while the metropolitan area had a population of 1,827,200, an increase of 34.8% since 1950.

A proposed revision of the zoning laws was being prepared during 1955 by Harold M. Lewis of New York, who had called attention to the avoidable congestion in the downtown district which could be mitigated by zoning limitations of bulk and height of buildings.

At a meeting early in the year, Harland Bartholomew, chairman of the National Capital Planning commission, described

Table I.—Leading Field and Fruit Crops of Washington

Crop	Estimated 1955	1954	Average, 1944-53
Wheat, bu.	55,561,000	72,444,000	71,692,000

progress on realization of the comprehensive plan of 1950. He outlined the locations of the inner and outer circumferential routes. The commission had approved a street revision which promised to eliminate one third of the heavy traffic in the congested Union Station plaza. The commission of fine arts, under the chairmanship of David Finley, had co-operated with the planning commission to protect the mall and its axis bridge from the Lincoln memorial to Arlington cemetery against encroachments of a proposed central area mixed traffic bridge across the Potomac river. A recent recommendation would clear the Great Plaza in the triangle of federal buildings of hundreds of parked cars in order to develop the gardens planned by the McMillan commission. During the year the Washington-Baltimore parkway came into operation and the East Capitol bridge over the Anacostia river was opened for traffic in November. An aroused citizenry came to the rescue of Rock Creek park when it was proposed to route a through highway from the west down its entire length. Late in 1954 a supreme court decision written by Justice William O. Douglas upheld the powers of the District of Columbia Redevelopment Land agency and declared aesthetic provisions a legitimate part of sound redevelopment.

Wealth and Income, Distribution of. The 1955 *Survey of Consumer Finances* in the United States, published by the board of governors of the federal reserve system, supplied information on the distribution of income for 1954 and liquid assets in early 1955. Previous surveys had made information available for the period 1945-53. The surveys were based on small field canvasses of consumer spending units, defined as all persons living in the same dwelling and related by blood, marriage or adoption who pooled their incomes for their major items of expense.

Survey data on the percentage distribution of spending units according to size of holdings of liquid assets—U.S. government securities, deposits in savings and checking accounts at banks, and shares in savings and loan associations—are provided in Table I. From 1954 to 1955 the percentage of spending units

Table I.—Distribution of Spending Units by Size of Liquid Asset Holdings

owning liquid assets declined from 74 to 71, as compared with the high of 76 reached in early 1946. The median holding of all spending units declined from \$350 in early 1954 to \$250 in early 1955, but the median holding of those that held some liquid assets was virtually unchanged.

Table II summarizes data provided by the surveys on the distribution of spending units and total money income (before taxes) according to size of income. There was little change in the distribution of income from 1953 to 1954. Previously there had been a general upward movement in the post-World War II distribution. The expansion of total money income in the post-war years resulted in a shifting of many consumers to higher

income levels. This shifting pervaded the income distribution. When the nation's spending units were ranked into tenths by size of income, it was found that the proportionate shares of

Table II.—Distribution of Spending Units and Money Income Received, by Income Groups

total money income received by all but the highest tenth in 1954 were quite similar to those in 1946. The share accounted for by the highest tenth declined from 32% to 29% over the period.

A longer-term comparison of changes in the distribution of income is afforded by Table III. This shows for selected years

Table III.—Percentage of Family Personal Income Received by Each Fifth of Consumer Units*

Consumer units ranked from lowest to highest income	1935-36	1941	1944	1950	1953
Lowest fifth	4.1%	4.1%	4.9%	4.8%	5.0%
Second fifth	9.2	9.5	10.9	10.9	11.3
Third fifth	14.1	15.3	16.2	16.1	16.5
Fourth fifth	20.9	22.3	22.2	22.1	22.3
Highest fifth	51.7	48.8	45.8	46.1	44.9
All groups	100.0%	100.0%	100.0%	100.0%	100.0%
Top 5%	26.5%	24.0%	20.7%	21.4%	20.7%

*Family personal income represents the current income (before income taxes) received by the civilian noninstitutional population. It includes income in kind as well as money income.

Source: Data for 1935-36 and 1941: Selma Goldsmith, George Jaszi, Hyman Kaitz and Maurice Liebenberg, "Size Distribution of Income Since the Mid-thirties," *The Review of Economics and Statistics* (Feb. 1954); data for later years: Selma Goldsmith, "Income Distribution in the United States, 1950-53," *Survey of Current Business*, U.S. Department of Commerce (March 1955).

of the period from 1935-36 to 1953 the percentage of all income going to each fifth of the total number of consumer units (families and unattached individuals), ranging from those with the lowest incomes to those with the highest.

The data indicate a distinct reduction in relative income differences. From 1935-36 to 1953, the share of total income received by the highest bracket declined from 52% to 45%, whereas all four of the other brackets improved their relative positions. The loss of the highest quintile affected mainly the top 5% and was heaviest for the top 1%.

State Distribution of Income.—The flow of individual incomes was relatively stable throughout the United States in 1954, the latest year for which department of commerce estimates were available in 1955. For the continental United States as a whole, personal income totalled \$285,000,000,000—about \$2,000,000,000, or just under 1%, higher than in 1953.

By regions, aggregate income in 1954 was about the same or slightly higher as compared with the previous record year 1953. (See Table IV.) In 34 states and the District of Columbia personal income in 1954 was within 2% of the 1953 total. In most of the remaining states the income change was 4% or less.

On a nation-wide basis, per capita personal income (total personal income divided by total population) was \$1,770 in 1954. Among states, per capita incomes ranged from \$873 in Mississippi to \$2,414 in Nevada. Others in the top rank—with average incomes of more than \$2,000 in 1954—were Delaware, Connecticut, District of Columbia, New Jersey, New York, California, Illinois and Michigan.

Table IV reveals clearly the relatively high income levels of the northern and far western parts of the country. Despite the substantial progress they had made over the past quarter of a century, the 11 southeastern states in 1954 had a composite per

*The estimates of "state personal income" shown in this table differ in definition in one respect from the personal income data presented in Table IV of the article, *Income and Product, U.S.* This pertains to the exclusion from the state estimates of income disbursed by the federal government to its civilian and military personnel stationed outside the continental United States.

Source: United States Department of Commerce, Office of Business Economics.

capita income 35% below the average for all other states.

From 1929 to 1954, a period of tremendous economic growth, there was a pronounced relative shift of total income from the New England and middle east regions to the south and far west. As shown in Table IV, the rates of income expansion in the far west, southeast and southwest substantially exceeded the nationwide rise of 233%, whereas the gains in New England and middle east fell far short of it. The combined proportionate share of the nation's total income received by the south and far west increased 37% from 1929 to 1954, while that of the northeastern area (New England and middle east) declined 20%. However, aggregate income in the populous northeast in 1954 still accounted for one-third of the national total. (See also *INCOME AND PRODUCT, U.S.*) (C. F. Sz.)

United Kingdom.—Total personal income reached a record height of £14,544,000,000 in 1954, having risen by 6% over 1953—the same rate of increase as in the previous year. About

one-tenth of the total consisted of public or private pensions and similar benefits. Taxes on income and national insurance contributions took 12.5% of total personal income, slightly more than in 1953. On the other hand payments of indirect taxes (partly offset by subsidies) fell slightly to 12% of total income.

The distribution of personal income in 1954, shown in Table V, indicated a further upward shift in incomes resulting chiefly

Table V.—Distribution of Personal Income in the United Kingdom, 1954*

Range of income (in £)	Number of incomes† (in thousands)	Amount of income before tax (in million £)	Amount of income after income tax and surtax (in million £)
Under 250	8,540	1,440	1,432
250—500	8,690	3,280	3,158
500—750	5,900	3,575	3,364
750—1,000	1,750	1,475	1,335
1,000—1,500	700	840	699
1,500—2,000	210	360	274
2,000—5,000	257	748	484
5,000—10,000	41	275	124
10,000 and over	12	197	50
Total	26,100	12,190	10,920

*No account is taken of £2,354,000,000 accruing to persons which, for lack of information, could not be allocated to particular ranges of income.

†A married couple is for this purpose counted as a single income recipient.

Source: Central Statistical Office, *National Income and Expenditure 1955* (H.M.S.O., London, 1955).

in an increase of 1,300,000 in incomes over £500 compared with 1953. Since 1949 the number of incomes between £500 and £1,000 rose from 2,690,000 to 7,650,000, those between £1,000 and £2,000 from 550,000 to 910,000, and those above £2,000; i.e., incomes liable to surtax, from 230,000 to 310,000.

Personal incomes after income tax and surtax were more evenly distributed in 1954 than in 1949, and especially more evenly than in 1938. The major difference appeared in the share of the upper 1% of income recipients which was halved over the period. In 1938 about 50,000 had incomes, after tax, of more than £2,400, to which a net income of £6,000 corresponded in 1954 when only 190 persons had incomes exceeding this figure. Weeks, Sinclair (1893—), U.S. cabinet member, was born at West Newton, Mass., on June 15. His father was John W. Weeks, secretary of war under Pres. Warren G. Harding. After graduating from Harvard university, Cambridge, Mass., in 1914, he worked for the First National bank of Boston, Mass., until 1923, except for a period during World War I when he served overseas as a captain with the first field artillery. He later became a successful manufacturer, was president of Reed and Barton, silversmith company of Taunton, Mass., and director of a number of large corporations.

Long active in Republican politics, he became a national committeeman for Massachusetts in 1940. He was treasurer of the Republican national committee from 1941 to 1944, and in the latter year served some months in the U.S. senate, on appointment to fill a vacancy.

In 1949 Weeks was chosen national finance committee chairman of the Republican party. On Jan. 21, 1953, he was sworn into office as secretary of commerce in Pres. Dwight D. Eisenhower's cabinet. The following March 31 he declared his opposition to price or wage controls of any kind. On July 29, 1954, Weeks announced record highway, airport and shipbuilding programs, sponsored and partly financed by the federal government.

Weeks was involved in a dispute with the U.S. house of representatives' judiciary subcommittee in the summer of 1955 over his refusal to divulge records of the department of commerce's business advisory council.

Weight Lifting. The visit of a United States squad to Moscow, U.S.S.R., and the rise of Americans in the sport of strong men sparked interest in this pastime in 1955. The first dual athletic competition between the United States and the Soviet Union since World War II was held on June 15 and resulted in a tie. Paul Anderson, young American who was to become a sensation during the year, lifted 402.34 lb. in the press and 425.48 lb. in the clean and jerk for new world records. His total in three events was 1,163½ lb., an all-time high. Nikolai Kostylev, Soviet lightweight, with a snatch of 270.06 lb., also established a universal mark.

Anderson, who hails from Toccoa, Ga., had become the first man to clean and press 400 lb. when he lifted 402 on April 16 in the All-South Amateur Athletic union championships. The 22-year-old star had gained undisputed acclaim as the world's strongest man in the national A.A.U. title meet at Cleveland, O., on June 5, when he bettered all recognized world standards. The Georgian pressed 390 lb., went to 435 lb. in the clean and jerk and added a 320 snatch for a total of 1,145 lb. to surpass the universal record.

Tommy Kono, Sacramento, Calif., in winning his fourth straight national title in the 181-lb. class, lifted 940 lb. for a new American mark. Four other U.S. standards were set in the meet, one being the 300-lb. snatch by Dave Sheppard in the 198-lb. division. Anderson climaxed a campaign of sensational feats by winning the heavyweight laurels in the world amateur championships at Munich, Ger., in October. He lifted a record 1,130 lb. for the Olympic triathlon, which consists of the three standard lifts—press, snatch and clean and jerk. He opened the heavyweight competition with a new world record by pressing 410 lb. to better his own mark by 7, then he elevated 320 lb. in the snatch and 400 lb. in the clean and jerk.

Among the major winners of 1955, with total pounds lifted, were the following:

U.S.—Soviet Team Match		
Bantamweight—Vladimir Stogov, U.S.S.R.	699½	
*Featherweight—Rafael Crimishkyan, U.S.S.R.	749

West Virginia. West Virginia was admitted to conditional statehood on Dec. 31, 1862, and proclaimed a state on April 20, 1863. It has an area of 24,282.45 sq.mi., of which about 150 sq.mi. are water surface. Pop.: (July 1, 1955, est.) 2,001,000; (1950 census) 2,005,552. In 1950 the urban population was 34.8% of the total. There were 113,735 Negroes and 33,640 foreign-born whites. Charleston, the state capital, had a population of 73,501. Other cities with 10,000 or more inhabitants in 1950 were: Huntington, 86,353; Wheeling, 58,891; Clarksburg, 32,014; Parkersburg, 29,684; Fairmont, 29,346; Morgantown, 25,525; Weirton, 24,005; Bluefield, 21,506; Beckley, 19,397; South Charleston, 16,686; Martinsburg, 15,621; and Moundsville, 14,772. Unincorporated South Parkersburg had a population of 10,808.

History.—The state officers in 1955 were: governor, William C. Marland; secretary of state, D. Pitt O'Brien; treasurer, William H. Ansel, Jr.; auditor, Edgar B. Sims; attorney general, John G. Fox; state superintendent of free schools, William W. Trent; and commissioner of agriculture, J. Blaine McLaughlin, all Democrats. During the first part of 1955 public interest centred in the proceedings of the first session of the 52nd legislature as they affected proposed increases in the salaries of public-school teachers, proposals for increased revenues for roads and the recommendations of a legislature interim committee for the reorganization of the administrative machinery of the state road system. For each of these objectives the governor had his program as did also each branch of the legislature. Resulting stalemates continued to the end of the session, leaving the schools without additional state funds, but those for roads were increased by increasing the tax on gasoline from five to six cents a gallon. The governor vetoed a bill vesting control of the state road system in a commission of ten executive-appointed members, thus leaving it in the control of a single executive-appointed commissioner functioning as the executive officer of a state road commission of five members. A five-day (May 9-13) extra session failed to provide additional state funds for teachers' salaries.

In compliance with the opinion of the U.S. supreme court of May 17, 1954, West Virginia was one of the first states to take action to effect the desegregation of the races in the public schools and state-supported institutions of higher learning. In an effort to accelerate desegregation, legal action was taken against three county school boards in Sept. 1955. The two teachers' associations were merged on Oct. 15, 1954, and desegregation was effected, in 1954-55, without friction or notable incidents in all the institutions of higher learning, both private and denominational and state supported.

Education.—The total pupil enrolment in the 3,234 elementary schools in 1954-55 was 298,148. In the 383 secondary schools (junior and senior) it was 159,600. Total receipts for the public-school program were \$79,084,036.26, of which \$47,435,828 were regular state aid; \$1,671,701.40 were federal aid; and \$28,679,100.33 were local collections.

There were nine state-supported institutions of higher learning under control of a state board of education, which, in 1954-55 had a total enrolment of 7,361, including 1,803 part-time students, and a total teaching staff of 481. The state also supported the board of governors-controlled university at Morgantown and Potomac State college at Keyser. There were also nine senior and junior private and denominational colleges with a total enrolment of 3,390, including 1,945 part-time students.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1955, the state department of health supervised the expenditure of \$2,065,167, of which \$476,761 were federal grants; \$776,870 were state funds; \$784,872 were local funds; and \$26,664 came from private agencies. Public assistance departmental expenditures for the year totalled \$34,458,834 or \$1,317,979 more than for 1953-54. Items for 1954-55 were: aid to dependent children, \$16,784,275; old-age assistance, \$8,741,909; aid to permanently and totally disabled, \$3,175,192; personal service, \$1,434,690; general medical and hospitalization, \$1,322,678; general assistance, \$954,927; boarding care, \$860,134; aid to the blind, \$484,417; aid to crippled children, \$412,598; current expenses, \$360,806; child welfare, \$75,626; prevention of blindness, \$32,393; and equipment, \$9,187.

Transportation and Communication.—As of Jan. 1, 1954, there were 31,291 mi. of state road, of which 4,931 were primary and 26,360 were secondary. There were 4,599 mi. not in the state system; 1,682 rural, 514 national forest roads and 2,403 city streets. There were 393,997 passenger cars. There were eight interstate airways communication stations. There were about 30 operating radio stations and 5 functioning television stations. As of Jan. 1, 1955, there were 364,565 Bell telephones handling an average of 1,952,479 calls daily.

Banking and Finance.—Total state receipts, including a cash balance of \$51,908,951.90 as of June 30, 1954, were \$415,046,318.28, and total disbursements, including transfers, were \$370,605,795.57, leaving a cash balance, as of June 30, 1955, of \$44,440,522.71. The chief sources of state income were: gross sales tax, \$36,511,720; federal aid, \$34,817,413; and the consumers sales tax, \$26,225,212. The largest state expenditures were \$66,887,654, or 38.7%, for schools; \$49,145,903, or 26.2%, for roads; and \$43,831,215, or 23.4%, for health and welfare. As of June 30, 1955, the total bonded indebtedness of the state was \$140,861,000, of which \$59,100,000 was for veterans and \$81,761,000 was for roads.

As of June 30, 1955, the total resources of 75 national banks were \$642,533,000; of 107 state banks and trust companies, \$554,603,262.04. The respective resources of 21 federal savings and loan companies, 16 state building and loan associations and 26 industrial savings and loan companies were \$90,558,290, \$22,701,523.33 and \$20,387,320.84, respectively. There were 168 small loan companies with total resources of \$34,863,919.42 and 29 state chartered credit unions with total resources of \$1,720,952.15.

Agriculture.—The total cash farm income for 1954 was \$122,813,000 or \$2,377,000 less than for 1953, but \$81,980,000 more than for 1940. Of the total cash income for 1954, \$1,332,000 was government payments; \$94,030,000 was for livestock and livestock products; and \$28,783,000 was for crops. The value of products consumed on the farms where produced was \$43,096,000, making a total gross farm income of \$167,241,000, or \$4,027,000 less than for 1953.

The number of cattle on farms, 611,000 as of Jan. 1, 1955, was 6,000 less than for the corresponding date of 1954. The 165,000 hogs were

Table I.—Principal Agricultural Products of West Virginia

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	8,041,000	9,045,000	9,925,000
Wheat, bu.	920,000	1,152,000	1,388,000
Oats, bu.	2,052,000	1,898,000	1,693,000
Hay (all), tons	1,092,000	1,082,000	997,000
Apples (commercial), bu.	3,700,000	5,600,000	3,642,000
Potatoes, bu.	1,690,000	1,680,000	2,086,000
Barley, bu.	490,000	585,000	323,000
Tobacco, lb.	4,160,000	4,960,000	3,912,000
Peaches, bu.	566,000	682,000	546,000

Source: U. S. Department of Agriculture.

about 11% more; the 311,000 sheep about 2% less; the 65,000 horses and mules about 6% less; and the cash receipts for poultry and eggs for 1954 were \$39,812,000, or 6% less than for 1953. This decline was, however, the result of lower prices rather than of decreased production.

Manufacturing.—The value of the manufactures (\$1,744,000,000) produced in 1954 was \$109,000,000 less than in 1953 and \$131,000,000 less than the peak year, 1951. The decline was the result of lower prices

rather than of decreased production, and the value of the manufactured product was 226% greater in 1954 than in 1940. The number of employees was, however, only 38% greater. Employment in manufacturing plants declined to a five-year low in 1954, being 13,175 below the average monthly record established in 1948, but there was a substantial increase in the 12-month period ending in June 1955. The 36,616 employees in the chemical and related industries were 1,383 less than in 1954, and their total annual wage, \$153,350,337, was \$2,732,375 less. Although there was a marked recovery in the coal-mining industry, the 68,727 employees was the smallest average monthly number since 1933, and their total annual wage, \$309,448,793, was the smallest since 1946. Respective data for other industries were: iron and steel, 36,520 and \$169,179,734; glass, pottery, brick and tile, 26,943 and \$96,749,237; oil and gas, 11,805 and \$40,444,206; and lumber, 8,900 and \$19,226,618. (C. H. A.)

inary) whose value exceeded \$100,000. In 1953 West Virginia was first among the states in output of coal and fourth in bromine and ranked fifth in the value of its mineral output, with 5.49% of the U.S. total.

Wheat. The U.S. crop of all wheats in 1955 was 915,528,000 bu., 6% smaller than in 1954 and 21% smaller than the 1944-53 average of 1,154,073,000 bu. The yield of 19.3 bu. per acre was higher than the 18.1 bu. per acre of 1954 or the 1944-53 average of 17.1 bu. per acre. Though an estimated 57,463,000 ac. were sown, drought induced substantial abandonment and only 47,376,000 ac. were harvested as compared with 53,712,000 ac. in 1954 and an average of 67,656,000 ac. for the previous decade.

The fall sown winter wheat crop, planted on 43,585,000 ac., produced 689,403,000 bu. as compared with 790,737,000 bu. in 1954 and an average 867,390,000 bu. in 1944-53. The yield was 20.3 bu. per acre as compared with 20.5 bu. per acre in 1954 and 18.0 bu. per acre average for 1944-53.

The 1955 U.S. crop of spring sown wheats was 226,125,000 bu. as compared with only 179,044,000 bu. in 1954 and an average of 286,683,000 bu. for 1944-53. The average yield was 16.8 bu. per acre as compared with 11.9 bu. per acre in 1954 and 14.6 bu. per acre average for 1944-53.

Production of durum spring wheat was indicated at 14,379,000 bu. as compared with the near-failure crop of only 5,557,000 bu. in 1954. However, the 1955 crop was less than half as large as the 33,432,000-bu. average of 1944-53 and the 1,074,000 ac. for harvest were 19% below 1954 and far below the average 2,564,000 ac. of the previous decade.

Table I.—U.S. Wheat Production by Leading States

State	Indicated 1955	1954	Average, 1944-53

World total	7,315	6,930	7,380	5,900	6,085

Wheat production by class in 1955 showed the usual dominance of hard red winter wheat of the southern plains with about 398,000,000 bu. Hard red spring wheat from the northern plains was second with about 186,000,000 bu. and soft red winter wheat, grown mostly in the midwest and east, was 183,585,000 bu. The 1955 crop of white wheat, grown mostly in the Pacific northwest, was about 129,095,000 bu. Durum, the macaroni wheat, was only 14,379,000 bu.

In the U.S. the average support price for wheat under acreage allotment and marketing quota was reduced from \$2.24 on the 1954 crop to \$2.08 on the 1955 crop to a minimum of \$1.81 (76% of parity) on the 1956 crop. The average price received by producers for wheat in October was \$1.94 per bushel as compared with \$2.08 a year earlier and a 1947-49 average of \$2.14 per bushel. Growers in the 36 commercial wheat states voted approval of marketing quotas on the 1956 crop at the reduced support level by 77.5% as compared with the two-thirds required and only 73.3% approval on the 1955 crop.

U.S. wheat exports in 1954-55 were about 274,000,000 bu. as compared with 217,000,000 bu. in the previous year and as much as 475,000,000 bu. as recently as 1951-52. Exports of wheat and flour (in wheat equivalent) during the first quarter of the 1955-56 marketing year were 70,000,000 bu. as compared with only 54,000,000 bu. for the same period a year earlier.

In spite of the much reduced acreage and smaller 1955 crop carry-over, stocks continued to accumulate to a record level of 1,021,000,000 bu. on July 1, as compared with 902,000,000 bu. a year earlier. By some calculations it appeared that stocks plus the new crop, a total of about 1,940,000,000 bu., would supply prospective use of 485,000,000 bu. for food, 63,000,000 bu. for seed, 75,000,000 bu. for feed and 275,000,000 bu. for export, and still result in somewhat increased year-end stocks of about 1,040,000,000 bu.

About 1,000,000,000 bu. of the carry-over on July 1, 1955, was owned or controlled by the CCC.

A near-record world wheat crop of 7,315,000,000 bu. was estimated for 1955 as compared with 6,930,000,000 bu. in 1954, a record 7,380,000,000 bu. in 1953 and a prewar average of 6,085,000,000 bu. Acreage was expanded to 473,470,000 as compared with 464,630,000 ac. in 1954 and a prewar average of 424,900,000 ac.

Canada produced a good but not bumper crop of 500,587,000 bu. as compared with 298,909,000 bu. in 1954 and an average 312,399,000 bu. prewar. The new crop plus a large carry-over of 522,000,000 bu. and exports of only 253,000,000 bu. in 1954-55, as compared with 392,000,000 bu. two years earlier, gave rise to storage, transport and financing problems. The government advanced \$1.40 per bushel on grain delivered, but deliveries were restricted and farm incomes declined in some areas to three-fifths of what they were in 1953. In November it was announced that government-guaranteed bank loans up to \$1,500 would be made against farm-held grain. The price was twice lowered in the early autumn to about \$1.70 per bushel for

no. 1 northern to meet export competition.

Indications from both Europe and Asia were favourable, with quality in western Europe significantly improved. The French crop was again large; France, now a major exporter, became concerned about outlets and prices. Turkey's harvest was substantially improved over the poor 1954 crop. Both eastern Europe and the important Ukraine and Caucasus areas of the U.S.S.R. were reported as harvesting good crops. It was indicated that about 90% of the world's wheat crop was produced and marketed under price supports of one type or another, most of which resulted in increased production. World trade in wheat in 1954-55 was 943,000,000 bu., 7% above the 879,000,000 bu. of the previous year, but well below the 1,066,000,000 bu. of 1951-52. Carry-over stocks of the U.S., Canada, Australia and Argentina of 1,868,000,000 bu. were approximately enough for two years of world trade.

About 290,450,000 bu. moved under the International Wheat agreement in 1954-55 as compared with 225,200,000 bu. in the previous year. The U.S. supplied 139,486,000 bu., Canada 109,343,000 bu., Australia 41,245,000 bu. and France a small amount. The total was substantially below guaranteed quantities of 393,047,000 bu., but the price was not reduced to the minimum, so importing countries were not called upon to take up their guaranteed purchases. During the first quarter of 1955-56, 54,049,000 bu. were sold under the agreement against a quota for the full year of 394,958,000 bu. The U.S. sold 22,420,000 bu., Canada 23,812,000 bu.

Flour.—Preliminary indications were that U.S. consumption of wheat in the form of flour would be 121 lb. per capita in 1955, 3 lb., or 2%, less than in 1954, 90% as much as the average for the early postwar period but only 77% as much as the 157 lb. of prewar. Wheat prices declined modestly, but rising processing and distribution costs resulted in slightly higher flour prices, and bread prices increased about 2%. In 1954-55, 46,287,000 bu. of wheat were exported as flour as compared with 33,212,000 bu. in 1953-54. Flour buying during much of the early part of the year was hand to mouth, anticipating apparently some price decline because of sheer weight of wheat supplies. However, flour buying was very heavy for winter wheat in mid-July and for spring wheat after mid-August. Mill prices in November were mostly more than \$6.75 per hundredweight; under the provisions of public law 311 all-purpose wheat flour was distributed to needy families through state welfare agencies.

(J. K. R.)

Wildlife Conservation.

Recognition of ever-mounting needs of people and increased competition in land use were cited by the U.S. fish and wildlife service as resulting in governmental emphasis on the importance of attaining a working partnership among federal, state and local governments, and with private interests, in the management and development of wildlife resources. The service recorded definite progress during 1955 in bringing its programs closer to state and local communities through obtaining an increased understanding of its purposes and enlisting co-operative participation in them.

Wildlife refuges were still being established despite little in the way of direct appropriations since 1940. The expansion was largely through the use of suitable areas acquired by other government agencies for other public purposes. The Stillwater National Wildlife Management area of more than 200,000 ac. was established on lands of the Truckee-Carson irrigation district, Nevada, and the Loxahatchee, of 114,000 ac., on lands of the south Florida flood-control district. Among others established during the year was the Kirwin Management area, 10,800 ac. on a bureau of reclamation impoundment in western Kansas, the first federal refuge in that state. A smaller refuge (112 ac.),

where prices prohibited acquisition by purchase, was donated on the eastern end of Long Island.

Encroachments of waterfowl habitat, in public and private ownership, constituted a serious menace to conservation. Destruction of habitat had occurred faster than conservation agencies had been able to restore it. One effective method of combatting such loss was to increase the use of suitable refuge lands for intensive production of crops to feed ducks and geese. Another was to eradicate pest plants, including cattail, salt cedar and noxious weeds.

Fire reached disastrous proportions in 1955 on the 329,000-ac. Okefenokee National Wildlife refuge in Georgia.

The serious threat of the military to encroach upon public lands dedicated to conservation use was dramatized by the army's insistence on acquiring an important area of the Wichita Mountains National Wildlife refuge in Oklahoma. Although the army and its supporters prevailed temporarily over conservation interests and obtained congressional approval for taking about 10,700 ac. of this 59,000-ac. refuge as an addition to the Fort Sill artillery practice ranges, Secretary of the Interior Douglas McKay later declared that he was "unalterably opposed" to the transfer, and the threat was still being held off at the end of the year.

During 1955 about 80,000 ac. were added to the existing 3,269,549 ac. in wildlife refuges. Eight refuges brought the total under jurisdiction of the fish and wildlife service to 264 in 42 states, Alaska, Hawaii and Puerto Rico. Three others were in process of establishment. In addition the service maintained 89 fish hatcheries in 42 states.

More than 15,000,000 hunting licences were issued by the several states during 1955, and more than 2,000,000 duck stamps were sold, the latter being required by the federal government of every migratory-bird hunter 16 years of age or older. The problem of meeting the needs of both hunter and hunted continued. State and local viewpoints are ascertained by the fish and wildlife service before annual regulations governing the hunting of migratory birds under federal protection are determined. Of late the states had organized their waterfowl programs along the flyway line, the flyway being the unit of management for migratory birds. Waterfowl surveys throughout North America were accomplished by combining the efforts of the fish and wildlife service, the Canadian wildlife service, provincial and state game boards and private organizations. In addition, surveys were made in 25 states and Alaska by service biologists and state conservation agencies.

To trace bird migration routes and map the flyways, 17 states (compared with 11 in 1954) co-operated in an enlarged waterfowl banding program in Canada. For the first time a sizeable banding program was initiated in the maritime areas. In the whole banding program, about 176,000 birds were banded during the year, with special attention to the migration of mallards and mourning doves.

Co-operative wildlife research units, which are operated by the fish and wildlife service, the Wildlife Management institute, land-grant colleges and conservation departments of 16 states and Alaska, continued their programs of research, training and conservation education. During the school year 1953-54, 202 wildlife students, including 71 with advanced degrees, were graduated. Part of the results of completed projects by the co-operative units were summarized during the year in 129 publications of wide distribution, providing facts useful both to wildlife technicians and to the public.

Teamwork between state and federal agencies and other organizations responsible for the nation's wildlife and fishery resources was strengthened during the year. Three federal-aid laws promoted co-operative undertakings, and closer relations

between nation and state were achieved in the administration of the migratory bird laws enacted to carry out treaties with neighbouring countries, north and south, and to provide funds for refuge acquisition from the sale of migratory-bird hunting stamps—the so-called duck stamps.

Two federal-aid laws, known as the Pittman-Robertson and the Dingell-Johnson laws, provide for co-operative programs for improving living conditions for game birds and fish. These programs are supported by state funds augmenting federal funds derived respectively from the excise taxes on sporting arms and ammunition and on sport fishing gear. A third federal-aid law is the Saltonstall-Kennedy act of 1954, under the terms of which the federal government through the fish and wildlife service embarked on a research program designed to help the fishery industry expand production and develop new markets for fishery products. (See also NATIONAL PARKS AND MONUMENTS.)

(H. Z.)

International.—As part of the work of its survival service, the International Union for the Protection of Nature sent Lee Talbot, U.S. ecologist, to study the status and preservation of rare animals in North Africa and Asia. The International Committee for Bird Preservation arranged with the British authorities that live bombs should not be dropped on the bombing range at Knechtsand, Ger., during the months that the area was used by the vast numbers of moulting and therefore flightless shelduck. The work of the Wildfowl trust (Great Britain) for the preservation of the Hawaiian goose was encouraged by the finding in Hawaii of a hitherto unknown flock of 22 birds. This brought the world total of this species to at least 70 birds, including those in captivity.

Great Britain.—The Nature conservancy declared 15 new nature reserves and the Humber Wildfowl refuge. Among these the island reserve of Ynys Llandwyn was formed to try to re-establish one of the most important colonies of terns and other sea birds in Wales, which had dwindled seriously. Tring Reservoirs reserve was formed to protect its water birds—there had been the first recorded nesting site, in England, of the little ringed plover. Hermaness and Noss in the Shetland Islands were made into reserves because of their value as bird sanctuaries; great skuas, red-throated divers and eider ducks breed there. The Humber Wildfowl refuge, the first such refuge to be established in England, extended over 20 sq.mi. of tidal flats and water and protected a main roosting area of the pink-footed goose.

Commonwealth.—In India the government of Madhya Pradesh established the Kanha National park in the famous Banja Valley reserve, thereby giving added security to the swamp deer and many other Indian animals including tiger, sambar, gaur and black buck. Under the special care of the Indian Board of Wildlife, the great Indian rhinoceros increased in numbers and it was estimated that its world population had reached 440.

In Central Africa the government of the Federation of Rhodesia and Nyasaland set up an independent commission to advise the Southern Rhodesian government on its tsetse fly problems—probably no official action against wildlife had so disgusted world opinion as the annual destruction of 40,000 animals in tsetse fly control in Southern Rhodesia. In Northern Rhodesia the Game Preservation and Hunting association emphasized the necessity of preserving the red lechwe on the Kafue flats, almost its last remaining habitat, where its numbers had declined from 250,000 in 1934 to 25,000 in 1955. The work of the Fauna Preservation Society of Nyasaland in guarding the Mijeti hill area and improving it as a wildlife sanctuary by increasing the water supply was rewarded when in March the Mijeti was declared an official game reserve. The society was

also informed that the road which had been planned to pass through the Lengwe game reserve had been realigned. This road would have threatened one of the few remaining haunts of the nyala, a beautiful and rare antelope for which the Lengwe reserve had been specially created.

In Tanganyika the game department report gave details of fencing experiments against wild animals. Such experiments are of universal importance, for the time seemed to be approaching when large wild animals would no longer exist outside areas especially set aside for them, and when their existence even in reserves would only be tolerated if they could be strictly confined therein. The most important results of the experiments however were gained in electric fencing. When an electric fence of the type used by farmers to confine cattle was erected, damage by baboons, bush pig and bushbuck ceased at once, though monkeys either ran underneath the fence or jumped through it. A single electrified wire was at first broken by the larger animals, but many animals, elephants for example, seemed to learn by experience to avoid it. Altogether it was shown that electric fencing was a possible method of restricting the movement of game, its great advantage being cheapness.

Near False bay at the southernmost tip of Africa the Rondevlei bird sanctuary proved its value both as a wildlife reserve and a scientific ornithological observatory. In the early part of the year the duck population exceeded 3,000, of six species, and later a huge compact colony of many kinds of herons and egrets and a colony of African darters nested in the sedge beds.

(C. L. BE.)

Wilson, Charles Erwin (1890—), U.S. business executive and government official, was born on July 18 at Minerva, O. After graduating from the Carnegie Institute of Technology, Pittsburgh, Pa., in 1909, he went to work as an electrical engineer for the Westinghouse Electric and Manufacturing company, where he designed the first automobile self-starting motor produced by that company. He joined General Motors corporation in 1919 as an executive of one of the subsidiary companies; in 1929 he became a vice-president of the corporation and in 1941 president. Both during and after the war period he continuously pointed to the need for a permanent U.S. defense program that could be diverted speedily to war or peace production with a minimum of economic dislocation.

Wilson (sometimes confused with Charles Edward Wilson, president of General Electric company and director of defense mobilization from 1950 to 1952) was chosen for the post of secretary of defense by Pres. Dwight D. Eisenhower and was confirmed in that office by the U.S. senate in Jan. 1953 after he had agreed to sell his stock in General Motors Corp.

On Feb. 15, 1955, Wilson declared that the United States was leading the U.S.S.R. in production of nuclear weapons; and the following May 24 he said that the U.S. air force was superior to the Russian in both quality and quantity of equipment production. Commenting on the new "soft" foreign policy of the U.S.S.R. toward the western nations in 1955, Wilson said on Aug. 9 that it would not lead to any slowdown of U.S. defense efforts.

Windward Islands. The British colonies of Grenada, St. Vincent, St. Lucia and Dominica, forming the southern part of the Lesser Antilles in the Carib-

bean, constitute the British Windward Islands. The colonies have in common governor and (with Leewards) supreme court, but separate legislatures. Pop.: (1954 est.) 297,000; 95% Negro; some Caribs on St. Vincent and Dominica. Language: English; on Dominica and St. Lucia also French patois. Religion: Christian. Governors in 1955: Sir Edward Beetham and (from May 14) C. M. Devereil. Administrators: (Grenada) W. Macmillan; (St. Vincent) A. F. Giles; (St. Lucia) J. K. R. Thorp; (Dominica) H. L. Lindo.

History.—As a preliminary step toward the introduction of a ministerial government, the Windward Islands governments embarked on the advisory committee system in 1955, with the three elected members of the executive council as chairmen of the committees.

During her visit to Grenada in February, Princess Margaret officially opened the Windward Islands broadcasting service. Later in the year, Dominica celebrated the 150th anniversary of uninterrupted British rule.

In all the islands there was a marked increase in the production of export crops in the earlier months of the year, and in some cases, e.g. for vanilla in Dominica, better prices were obtained. The tourist trade also showed signs of improvement but a substantial part of Soufrière, the second largest town of St. Lucia, was destroyed by fire; and in Grenada, almost wholesale destruction to cultivation, crops, buildings, etc., was wrought by hurricane "Janet."

(L. C-LA.)

Education.—Government and aided schools (excluding Dominica, 1953): primary 132, pupils 78,413; secondary 11, pupils 2,363. *Dominica* (1952): primary and intermediate 43, pupils 10,835; secondary 4, pupils 656; 1 teachers' training school, students 20.

Finance and Trade.—Monetary unit: British West Indian dollar, valued in 1955 at 58.33 cents U.S.

Main exports: arrowroot, bananas, citrus products, cocoa, copra, sea island cotton, mace and nutmeg, sugar, vanilla.

Wines. Total world wine production during 1955 amounted to 5,432,000,000 gal., according to official reports and estimates, compared with 5,645,100,000 gal. during 1954 (a more accurate figure), an approximate 4% decrease. Some figures, notably those from Soviet-influenced countries, were pure estimates.

France was the largest producer again in 1955. Heat and hailstorms combined to lower the over-all yield, but otherwise healthy conditions and good weather during the vintage produced fine-quality French wines.

In 1954 Burgundy produced 57,300,000 gal., of which 5,400,000 gal. white and 22,400,000 gal. red were famous growths (*appellation contrôlée*). The 1955 estimates indicated approximately 38,000,000 gal. of very-good-quality Burgundy. Alsace produced 21,500,000 gal. in 1954, of which 19,800,000 gal. were fine growths. The 1955 estimate was for 23,500,000 gal. of good-quality wine. Bordeaux produced a total of 105,200,000 gal. in 1954, of which 36,300,000 gal. were white and 21,900,000 gal. were red famous growths. The forecast for 1955 was 132,000,000 gal. of excellent wines including 68,600,000 gal. famous growths. Champagne was up from 11,600,000 gal. to 13,200,000 gal. of excellent quality in 1955.

Italy continued in second place with mediocre quality and a 5½% increase in quantity. In Spain the Jerez district produced 10,160,000 gal. of very-good-quality sherry, somewhat more than in 1954. Production of port wine, controlled to world demand, in Portugal was held to 5,844,000 gal. of very fine wines, com-

pared with 5,065,000 gal. in 1954; Madeira totalled 2,900,000 gal. of very good quality compared with 3,260,000 gal. the previous year.

World Production of Wine
(Millions of gallons)

Country	1955	1954	1950-1954 Average	1955 quality

Total	5,432.0	5,645.1	5,345.0	

Countries like the United States, marked "No variation" in the above table, produce uniform wines from year to year because of stable climatic conditions and methods of production used.

*Provisional figure, same as previous year.

Germany, hit by frost during vintage, produced 18% less than the previous year. United States production for 1955 was estimated to be down 10%. (J. WE.)

Wisconsin. One of the north central states of the United States, Wisconsin, popularly called the "Badger state," entered the union as the 30th state in 1848. Area: 56,154 sq.mi., of which 1,449 sq.mi. is water. Pop.: (1950 census) 3,434,575; (July 1, 1955 est.) 3,691,000; of the 1950 population, 57.8% was defined as urban. Capital, Madison (1950 census), 96,056. Milwaukee, 637,392, is the largest city. Other large cities are Racine, 71,193; Kenosha, 54,368; Green Bay, 52,735; and La Crosse, 47,535.

History.—Wisconsin's bicameral legislature—Republican-controlled in both houses, considered a total of 1,435 bills during its regular session in 1955. Of these, 618 bills were enacted before recess (June) and 53 bills and one joint resolution were carried over for consideration in the recessed (October) session.

For the third consecutive session the legislature considered a number of plans for the integration of the state's institutions of higher education. Two separate boards of regents governed the state university and the state colleges. Until chapter 619 was passed by the fall session, they had operated without legal reference to one another. Though there had been consultation on such problems as budget formulation, the compromise integration bill, hammered out after sharp debate which split parties and regional factions, established a permanent joint co-ordinating committee over the existing regent boards to "make a continuing study of the state-supported institutions of higher education." This 15-member body (with university regent, college regent and private citizen representation) was given broad planning and budgetary powers. As one of its first duties it directed the university's Milwaukee extension centre to merge

with the existing state college in that city so that a single four-year institution of higher learning would be provided for the state's heavily populated southeastern section. The merged unit, which was to be established by Jan. 1, 1957, would be an integral part of the university, supervised by a resident provost who would report to the university's president.

The legislature also imposed a 20% surtax on personal incomes during 1955 and 1956 to help offset expected budget deficits; provided new authority for the state, the university, and the state colleges to construct and finance buildings through building corporations which could borrow money, and build and lease buildings for state use; prohibited political contributions by labour unions; changed the boundaries of the 4th and 5th congressional districts (two of three Wisconsin districts with Democratic incumbents).

The principal officers of the state during 1955 included: Walter J. Kohler, Jr., governor; Warren P. Knowles, lieutenant governor; Mrs. Glenn M. Wise, secretary of state; Warren R. Smith, state treasurer; Vernon W. Thomson, attorney general; George E. Watson, superintendent of public instruction. Mrs. Wise, appointed by the governor to serve the term of secretary-elect Fred R. Zimmerman, who died before inauguration, was the first feminine constitutional officer in the state's history.

Education.—In the school year 1953-54, there were 5,292 elementary schools, 445 secondary schools, and 23 country normal schools. Elementary school enrolment totalled 415,404; secondary schools 157,393; county normal schools 992. Elementary schools employed 15,813 teachers; secondary schools 7,422; county normal schools 106. By action of the 1955 legislature, the name county normal school was changed to county teachers college. State aids to education in 1953-54 amounted to \$25,135,294. Expenditures in the elementary and secondary schools totalled \$181,233,002. The 11 state colleges (two institutions formerly designated institutes were changed to state college status by the 1955 legislature) employed 705 faculty members to teach 9,641 college and 2,397 training school students.

Social Insurance and Assistance, Public Welfare and Related Programs.—The number of cases receiving public assistance as of June 30, 1955, with expenditures for the fiscal year ending on that date in parentheses, were as follows: general relief 8,188 (\$9,805,107); old-age assistance 43,095 (\$32,196,233); aid to the blind 1,139 (\$1,037,701); aid to the totally and permanently disabled 1,133 (\$1,207,927); aid to dependent children in their own or a relative's home 8,173 (\$13,286,854); aid to dependent children in foster homes 1,622 (\$1,004,344); a total of 63,350 households (\$19,349,560). Civilian unemployment benefits for the fiscal year 1954-55 were \$30,329,118; contributions collected amounted to \$19,349,560.

The cost of operating Wisconsin's 12 charitable, mental and correctional institutions for the year ending June 30, 1955, was \$18,507,071. The average daily population for June 1955 was 6,065.

Communications.—Public highways as of Jan. 1, 1955, totalled 95,425 mi. divided as follows: 85,775 (towns), 2,655 (villages), 6,995 (cities). Expenditures by the highway commission during the fiscal year 1954-55 amounted to \$88,728,396. Railway mileage (steam and electric) as of Dec. 31, 1954, was 6,427.8 with 63.36 mi. of trolley coach (trackless) route in Milwaukee. On Jan. 1, 1955, there were 1,149,802 telephones; on Oct. 1, 1955, there were 65 municipal airports and four seaplane bases.

Banking and Finance.—As of June 30, 1955, the 95 national banks had deposits of \$1,639,068,000 and assets of \$1,766,898,000. At the end of the calendar year 1954, the 463 state banks reported deposits of \$1,971,280,369. Assets amounted to \$2,126,992,508. Credit unions increased from 629 in 1953 to 680 in 1954. Assets were \$102,598,430, an increase of 19.6%. The 114 savings and loan associations listed assets of \$547,962,096.

State receipts for the fiscal year 1954-55 were \$255,750,094; disbursements totalled \$271,236,316. Taxes collected and returned to local subdivisions amounted to \$80,946,876; agency collections returned to counties were \$2,805,919; state aids amounted to \$81,481,284; moneys transferred from the general fund to other funds \$15,583,518.

Agriculture.—The total acreage harvested in 1954 was 10,248,000. Cash

receipts amounted to \$1,002,692,000, consisting of \$878,616,000 from livestock and livestock products and \$124,076,000 from crops. Farm commodity prices were at the lowest level since 1945.

Manufacturing.—The total value of manufactured products in Wisconsin increased from \$3,320,663,000 in 1952 to \$3,635,768,000 in 1953. Wisconsin ranked tenth among the states in value added by manufacture. In 1954 the estimated average number of wage earners in Wisconsin manufacturing establishments was 432,900 as compared with 472,500 in 1953 and 466,900 in 1952. The average weekly gross earnings per capita were \$74.79 in 1954 as against \$74.73 in 1953. (C. L. L.)

Table III.—Mineral Production of Wisconsin

Total	\$55,710,000	...	\$55,271,000

*Value included with other minerals.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Wisconsin in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953, Wisconsin was fourth among the states in the output of sand and gravel; and ranked 30th in the value of its mineral output, with 0.38% of the U.S. total.

Women's Fashions.

The year 1955 was a year of what might be termed "siren simplicity" in women's fashions. Clothes combined willowy sex appeal with fresh youthfulness and ease. Both the 1920s and the French empire had their reflections in the mode, but the blend was thoroughly contemporary. The year's favourite silhouette was a semifitted sheath which revealed the lines of the body without seeming to do so. The waistline was seldom marked by a belt, but its curve was apparent under a long, gently moulded bodice. The bosom line was high and round and the hipline was often accented. Many dresses, suits and coats had half-belts or sashes loosely placed low at the hipline or high, just under the bosom, but they were decorative touches, not meant to distort the normal proportions of the figure. Parisian designers Christian Dior and Balenciaga set the pace with their narrow tunics and semifitted coats and suits.

The influence of the orient, particularly of Japan, India and Turkey, was noted in all branches of fashion, affecting silhouettes, fabrics and colour combinations, and contributing a general mood of splendour. High-bosomed tunic coats derived from the men's coats of India, Persia or China were worn over straight tube dresses or a narrow skirt with a semifitted overblouse. These Asiatic coats were first noted in the American collections of Ben Zuckerman, Norman Norell and Charles

James, and later in such Paris collections as Christian Dior and Givenchy. By fall the "oriental look" was the accepted silhouette. Sari silks, Indian and Persian brocades woven with gold and rich colours, and heavy, loosely woven Indian wild silk were widely used, and the strange unexpected colour combinations of oriental costumes—pink and orange, green and peacock blue, lacquer red with black—were typical of the year's fashion. Dress styles emphasized harem touches. Ceil Chapman launched the Fatima silhouette with an elongated bodice, draped hipline and full "dancing girl" skirt, sometimes with a tucked-under harem hemline. Jewelled harem jackets and rich dolman evening wraps of satin were shown.

The ensemble costume, consisting of a matching coat and dress or two-piece suit with its own overblouse of satin or wool, was emphasized by most designers. The two or three parts of the costume were linked by interesting colour blends or an affinity of fabrics, woven in the same pattern or colour but of different weights.

Most designers found ways to widen the shoulder line without reviving padding. There were large spread collars, full puffed sleeves and elaborately bloused backs. Mainbocher in the United States and Dior in Paris introduced a rising shoulder line by giving tailored sleeves a small rounded hump at the top. This gave a pretty "lift" to the silhouette, like the effect created by harlequin eyeglasses.

Clothes for country living and easy-but-elegant at-home clothes occupied an important place in fashion, reflecting the trends toward suburban living and home entertaining. Both types of clothes combined elegance with ease—tweed suits had jewelled buttons or satin touches, and the favourite at-home costume consisted of sleek tapered trousers of satin, velvet or brocade with a sweater top or satin blouse.

The long evening dress came back into popular fashion. The stately ball dress cut straight or draped in narrow lines, the clinging *femme fatale* dress, and the elaborately bouffant ball dress supplanted the short evening dress among chic women. A new evening length which Chapman called "shorter than long, longer than short" and Pauline Trigere called "intermission length" also had great success. The Castle Walk dress, inspired by the pegtop, calf-length, wraparound dance dress of World War I, was the most popular short evening style. The long dinner dress, usually dark, narrow and often with long tight sleeves, high front and very low-cut back returned to high fashion, but was not an immediate popular success.

Fabrics in the grand manner were used for every purpose, bringing a luxurious, lady-of-quality air to all types of clothes. Daytime woollens, tweeds, worsteds and coatings stressed thistle-down weight and soft finish, and were woven in distinct patterns rather than the random textures of former years. Some deluxe woollens were woven with a mixture of the hair of precious furs, mink or sable, vicuna, angora or cashmere. Cocktail and evening dresses were made in sheer wool chiffon or wool jersey as thin as silk, sometimes mingled with gold.

Wide and boldly contrasting blazer stripes were seen in sports clothes, from cotton knit bathing suits to heavy winter coats. Clan plaid cottons and woollens were favoured in young fashions.

Fur returned as a favourite trimming. Mink and even sable edged evening coats and evening hemlines. Broadtail dyed red, blue or yellow was used to line tweed coats and jackets.

The evening coat and the evening wrap were very important in fashion through the year, bringing vivid colours in velvet, velveteen, corduroy and satin strongly into the coat sphere.

Brilliant colour was a pronounced keynote of the year's fashions, particularly in the unusual, off-beat blends combining the oriental with the modernistic. Red in all shades from Indian

EVENING DRESS of tucked beige *peau de soie* and re-embroidered matching lace, typical of the narrow, fitted look of 1955 formal wear

BUYERS AND FASHION REPORTERS at the 1955 Dior show at Paris, Fr.

pink to dark carnation, emerald green, sapphire blue and strong yellows were the favoured evening colours.

Brown in all tones from mushroom to dark walnut and green from moss to dark bottle green were heavily endorsed as basic colours, sharing the attention normally paid to gray and beige.

For the first time in several years, the hat became an essential of the smart costume, becoming larger, and being worn over the forehead to balance the thin delicate line of the body silhouette. Hair began to sweep up and backward, to complete the composition of the small elegant head. Fur hats and hats of fuzzy materials such as brushed velours and melusine were popular, and were frequently white above dark town suits or coats.

Shoes in vivid colours with picturesquely high, ultra thin heels, elaborate trimming and jewelled touches brought the focus of fashion to the feet. Fastidiously narrow and aristocratic, the daytime pump was often in coloured kid or calf with pipings of fabric. Evening slippers were fantasies of coloured satin and jewelled strips. Most shoes covered the toe only, leaving the instep and ankle bare without straps. (See also SHOE INDUSTRY.) (C. CN.)

Wool. Revision of world production figures for 1954 showed only slightly higher totals than had been anticipated. Total production during 1955 (the season of 1954-1955 for the southern hemisphere) would amount to about one half of one per cent more than in 1954, according to latest estimates. The most significant changes occurred in the estimated production of the four largest single producers in the world, with Australia showing an increase of approximately 2½%, New Zealand 2%, and South Africa 4%, while Argentina showed a 9% decline and Uruguay a 1½% drop. The United States and the combined minor-producing countries of the world showed little or no change in the over-all picture of production.

Estimated World Wool Production
(In greasy shorn pounds)

Country	1955	1954
Australia	1,280,000,000	1,246,000,000
New Zealand	434,000,000	425,000,000
Argentina	365,000,000	397,000,000
Uruguay	200,000,000	203,000,000
South Africa	295,000,000	282,000,000
United States	288,000,000	290,000,000
Total	2,862,000,000	2,843,000,000
Others	1,567,000,000	1,565,000,000
Grand total	4,429,000,000	4,408,000,000*

*Revised.
Source: Computed by the New York Wool Exchange from data released by the U.S. Department of Commerce and the International Wool Secretariat.

World consumption dropped during 1954, the indicated decline being about 10% from 1953, with the United States showing a drop of approximately 25% from the previous year as consumption was the lowest since 1938. However, commencing in Jan. 1955 a gradual improvement in consumption began, and although, in the aggregate, consumption had not reached the total of the post-World War II years, the first six months showed an approximate 3% gain over 1954. Greatest gains took place in the United States, Belgium, Canada and the German Federal Republic (western Germany).

With slightly improved consumption throughout the world as the year began, prices in the dominion auctions held steady from mid-November 1954 to the end of the auction season in June. As competition held prices steady, clearance of wools in the dominion wool markets was excellent despite postponements and delays occasioned by labour disputes. Meanwhile South American producers once again built up stocks as holders of wool were reluctant to accept world levels of prices. Argen-

tina's internal political struggles were also instrumental in holding down disposal of that country's stocks. The British Commonwealth continued to be the largest purchaser of dominion wools, taking slightly more wool in the 1954-1955 season than in the previous year, Japan, Germany and the United States increased their takings, while France and Italy declined slightly and the U.S.S.R. cut its direct purchases to nil.

The auctions opened in the dominion markets in late Aug. and early Sept. 1955 approximately 10%-15% under the levels of the closing sales in June. After a few weeks of easing prices, the markets took on a firmer tone with good competition bringing about clearances in all markets. Although consumption in the United States had improved, that country still was only a very light operator in world markets, as results of a proposed plan for disposal of government-owned wools were awaited. The world price for apparel wool in September was about \$1.40 per clean pound as compared with \$1.60 per clean pound a year previous and with \$1.70 per clean pound in 1953. (See also LIVESTOCK; TEXTILE INDUSTRY.) (H. D. W.)

Words and Meanings, New. English adds many new words to its vocabulary every year, some destined to live long, others to die soon. The words listed below, pertaining largely to 1954-55, are but a small residue of those collected by the committee preparing this article.

Attention may be called to several groups of the coinages below. As usual, scientific and technological advances were well represented among the new words and meanings: witness "aerosoloscope," "automated," "chlorpromazine," "gyrobus," "ICBM," "properdin," "pyrizinamide," and "spider." New terms such as "A-course," "Atlas," "blood chit," "brush fire war," "DEW line," "Red world," "summit," and "Texas Tower" reflected the international scene. The U.S. scene was represented by a number of interesting coinages in a variety of fields: for example, "active ease," "certified mail," "codetermination," "decompetition," "junk mail," "neo-Democrat," "oillonaire," "pedestrian window," "rock-and-roll," "toll television," and "urbiculture."

The words listed below became prominent or were seemingly used for the first time during 1954 and 1955. Dates within the parentheses following a word or definition indicate the first recorded use of the new word or meaning in the files of the committee.

A hyphen preceding the date means that the word or meaning is suspected of being older than the date given. If no date is given, the first record on file is 1955.

- accordionized, adj.** Compressed. (1954)
- A-course.** A course in the operation of nuclear reactors offered to the representatives of other nations by the U.S. as a part of Pres. Dwight D. Eisenhower's atoms-for-peace program.
- active ease.** A federal reserve policy for rather liberal granting of credit. (1954)
- activity area.** In current home architecture, the part of the house where some characteristic living activity is carried on.
- adventurama, n.** An adventure motion picture.
- aerosoloscope, n.** An instrument used to detect poison gas, etc.
- agonizing reappraisal.** A reappraisal necessitating unpleasant readjustments.
- air tractor.** An aeroplane for farm use.
- aldosterone, n.** An antirheumatism drug.
- A-line, n.** A 1955 feminine fashion featuring a flared skirt which tends to give the wearer the silhouette of an A. **A-look, n.**
- APC viruses.** Adenoidal-pharyngeal-conjunctival viruses.
- Archer cloth gown.** A gown, designed by Vincent W. Archer, made of spun glass, to protect radiologists from X-rays. (1954)
- Atlas, n.** An intercontinental ballistic missile. (1954)
- atom eye.** A device for measuring radio activity. (1954)
- atomic rain.** Radioactive fall-out from an atomic bomb blast. (1954)
- automated, adj.** Made automatic, through automation, or automatic control and instrumentation. (1952)
- beercasting, n.** Beer advertising on radio and TV. (1952)
- blood chit.** A guarantee of a reward payment in gold to anyone who helps a U.S. pilot, shot down in enemy territory, to escape. Also **blood chip.** (1944)
- boom bucket.** The ejection seat in a jet aeroplane.
- brainprint, n.** A photograph of brain waves. (1954)

- bricabracomania**, *n.* One who is excessively fond of bric-a-brac. (1954)
- Britonologist**, *n.* An archaeologist specializing in early British history. (1954)
- brush fire war**. A small but dangerous war. *Cf.* **proxy war**.
- certified mail**. Mail which, though uninsured, requires a signed receipt by the recipient. Put into practice June 3, 1955.
- cha-cha-cha**, *n.* A Cuban dance, to triple-beat time, popular in the U.S. (1954)
- chlorpromazine**, *n.* A drug for treating mental illness. (1954)
- church key**. *Slang*. A can or bottle opener, especially for beer.
- classic car**, *n.* An automobile manufactured during the period 1925-42.
- co-curriculum activities**. Activities during schooltime and under school supervision, not part of the course of study. (-1954)
- codetermination**, *n.* The management of a business by both management and labour.
- CONAD**, Continental Air Defense, with headquarters in Colorado Springs, Colo.
- cookfire**, *n.* A metal cooking stand for outdoor cooking. (1954)
- cue card**. A large card with key words or phrases used to prompt a person doing a telecast. (1954) Also called **idiot board** (1952). **idiot sheet**. (1953)
- cycloserine**, *n.* An antibiotic for the treatment of tuberculosis.
- DDVP**, Short for dimethyl dichloro vinyl phosphate, a new insecticide developed by the U.S. public health service, said to be more potent and less toxic than DDT.
- death-control**, *n.* Lengthening of human life by medical care. (1954)
- death jockey**. A reckless driver.
- decompetition**, *n.* The withdrawal of the U.S. government from fields in which it competes with private enterprise. **decompeting**, *n.*
- demolition derby**. A stock car bump-and-crash, elimination contest. (1953)
- DEW line**. Distant early warning radar line or fence (which see). (1953)
- dinitroamine**, *n.* A weed control spray.
- distant early warning line**. A line of radar stations in Canada and Alaska built to give warning of the approach of hostile aeroplanes. (1953)
- divider**, *n.* Short for **space divider** (which see). (1952)
- dream car**. An experimental automobile using many new devices and ideas. (1953)
- egobiography**, *n.* A highly subjective biography. (1954)
- electric yardmaster**. An electronic device for retarding railroad cars that have been "humped." (1954)
- Europeinize**, *v.t. Specif.* To put under the rule of a neutral commission; to neutralize and make part of all Europe. (1952)
- fish stick**. A frozen piece of fish all ready for cooking. (1953)
- floathouse**, *n.* A houseboat, but with emphasis on mobility.
- FLOGWINGS**, Fleet Logistics Air Wings.
- Flying Bedstead**. Nickname for a British vertical-take-off jet aeroplane, with four tubular legs, which rises by the vertical thrust of its engine against the ground. (1954)
- flying platform**. A circular platform which can rise vertically and hover, and is steered by the shifting of the pilot's weight. The U.S. navy's one-man helicopter.
- flying radar station**. Nickname for a Super Constellation that is radar-equipped for defense. (-1955)
- gadget bag**. A bag with a shoulder strap for carrying photographic supplies and equipment.
- GAW**, Guaranteed annual wage. (1954)
- glottocentric**, *adj.* Highly language conscious. (1954)
- gymnatorium**, *n.* A combination gymnasium and auditorium.
- gyrobus**, *n.* A bus powered by an electrically charged gyroscope.
- happy**, *n. Slang*. An off-beat jazz record.
- hard reader**. A person who specializes in reading difficult handwriting.
- heli-car**, *n.* A combination helicopter and car.
- helistop**, *n.* A landing field for helicopters.
- hinconstarch**, *n.* A drug effective against the tubercle bacillus.
- ICBM**, intercontinental ballistic missile. Formerly **IBM**.
- incomumerator**, *n.* A mechanical device for rapidly counting small articles.
- idiot board**, **idiot sheet**. *See* **cue card**.
- infiltrate**, *n.* One who has infiltrated. (1954)
- initiate**, *adj.* Descriptive of the quality of a genuine esoteric. (1954)
- junk mail**. Advertisements addressed simply to "occupant" or "boxholder." Discontinued in cities and villages March 21, 1955. (1953)
- lectern theatre**. A theatre in which a performance is read, not acted; a performance of this sort. (1954)
- LOGAIR**, All-cargo Logistics airline.
- logger**, *n.* An automatic recorder of conditions such as temperature and pressure.
- Lorac**, long-range accuracy. (1954)
- McGill Fence**. Mid-Canada line of robot radar stations for warning of approaching aeroplanes. (1954)
- metacortandracin**, *n.* A drug for the treatment of rheumatoid arthritis, more effective than cortisone. (1954)
- metacortandralone**, *n.* A drug more effective than cortisone in the treatment of rheumatoid arthritis. (1954)
- meteoriticist**, *n.* A student of meteorites.
- Mid-Canada line**. The **McGill Fence** (which see). (1954)
- mini-pig**, *n.* A small pig bred for medical research. (1954)
- morning-glory bandit**. Nickname for a robber who robs a bank just before opening time.
- neo-Democrat**, *n.* A person who has been a Democrat for only a short time. (1954)
- nontelevised**, *adj.* Not exposed to television shows. (1954)
- nursery weight**. The weight of a child.
- oillionaire**, *n.* A millionaire whose wealth is derived from oil. (1952)
- one-take**, *adj.* *Motion Picture*. Made with one photographing, without repetition. (1954)
- open occupancy**. State of being open to any race; "the subdivision is planned for open occupancy." (1954)
- OPSPA**. Nickname for an experimental drug (oxa-penta-methylene-diethyl-ene-thio-phosphoramidate) found to cure some cancers in animals.
- option**, *n.* *Football*. A play in which the quarterback (or other possessor of the ball) has an option of passing it or running with it. (1954)
- package book**. A book written to publisher's specifications. (1954)
- pedestrian window**. A teller's window placed on the outside of a bank so that depositors can do business without going inside.
- pediarchy**, *n.* Child dominance. (1954)
- pentolinum tartrate**. A drug for lowering blood pressure. (1954)
- perinatal**, *adj.* Related to birth (including such data as stillbirths and infant deaths).
- periodization**, *n.* Division into (historical) periods.
- piggy-back legislation**. A rider irrelevant to the purposes of the main bill.
- Pinetree Chain**. A chain of radar warning stations situated a short distance north of the U.S.-Canadian border. (1954)
- properdin**, *n.* A protein aiding immunity to disease. (1954)
- prosegregationist**, *n.* A person favouring continuation of "segregated" schools. (1954)
- prosopagnosia**, *n.* Loss of memory for faces.
- proxy war**. A small localized war. *Cf.* **brush fire war**.
- pyrizinamide**, *n.* An experimental antituberculosis drug.
- PZA**, short for pyrizinamide.
- rabbit**, *n.* A pacer in a running event in a track meet.
- radio sextant**. An instrument for navigating by radio waves.
- rawinsonder**, *n.* A person engaged in rawinsonde; *i.e.*, the collection of data concerning the upper atmosphere.
- Red world**. The communist-dominated countries considered as a unit.
- remediated**, *adj.* Subjected to remedial education. (1954)
- resegregate**, *v.t.* To return (a desegregated school) to its original state of segregation. (1954) **resegregation**, *n.* (1954)
- rock-and-roll**, *n.* A dance to music heavily accented on the second and fourth beats.
- runathon**, *n.* A high-scoring baseball game.
- scooter trailer**. A small trailer with sleeping accommodations.
- second banana**. *Slang*. A supporting comic actor or actress. (1953)
- shell house**. A house with an unfinished interior.
- sitting park**. A small park used primarily for sitting. (1954)
- skymobile**, *n.* A helicopter.
- smust**, *n.* A combination of smoke and dust. (1953)
- snook**, *n.* (*Cf.* **snook**, "An informer.") A collaborator with the enemy. (1954)
- soaperatic**, *adj.* Of or pertaining to soap opera. (1954)
- soap-sudder**, *n.* A writer and producer of TV shows.
- space divider**. A cabinet unit or partial wall used to divide different areas of a house. Also **divider**, *n.*
- spider**, *n.* Nickname for a radar device at Stanford university to study the smallest meteorites for information concerning radio communication, the weather, etc.
- squib kick**. *Football*. A short kick. (-1952) **squib**, *n.*
- summit**, *adj. Specif.* Top-level. Also *n.* (1953)
- surveillance-radar unit**. A device for locating aeroplanes in flight. (1954)
- topologist**, *n.* A sound-recording expert. (1954)
- Texas Tower**. One of a string of radar towers for warning of aircraft approach built along the continental shelf up to 100 mi. out into the Atlantic ocean. So called because it looks like an oil rig in the Gulf of Mexico. (1954)
- thermidity**, *n.* A formula for combining temperature and relative humidity in one figure.
- toll television**, **toll TV**, **toll video**. Television paid for by the viewer with a metering device.
- twi-night**, *adj.* Descriptive of two showings in one night. (1954)
- 2 x policy**. Massive retaliation.
- U-bomb**, *n.* A superweapon combining the principles of the A- and the H-bomb.
- UFO**, unidentified flying object. (1953)
- urbiculture**, *n.* Things pertaining to and of interest to city dwellers. (1954)
- water barrier**. A speed of about 200 m.p.h., considered very difficult for speedboats to attain or exceed.
- whoduniteer**, *n. Slang*. A mystery story writer. (1954) (I. W. R.)

World Assembly for Moral Re-Armament.

The chief assemblies for Moral Re-Armament in 1955 were held in Caux, Switz., at Mackinac Island, Mich., and at Washington, D.C. The assembly at Caux attracted 5,955 delegates from every continent, bringing the total since World War II to 84,000 from 121 countries.

From the Mackinac assembly, whose theme was "An Answer that Works," a world ideological mission travelled at the invitation of heads of state and leaders of government to 18 countries in Asia, Africa and the middle east. Among the 244 persons from 28 countries who participated in the mission were: Theodor Oberländer, minister in the Federal German cabinet; Eugene Claudius Petit, member of 10 post World War II French governments and minister of labour under Pierre Mendès-France; Mohammed Masmoudi, minister of national economy, Tunisia; Ole Bjorn Kraft, former Danish foreign minister, chairman of the North Atlantic Treaty organization (NATO), 1952-53; Joseph Scott of Los Angeles, Calif., leading Catholic layman and attorney; Jiro Hoshijima, senior member of the Japanese diet and supreme adviser to the Democrat party; and members of parliament from eight other countries.

Accompanying the mission was the ideological musical play

"The Vanishing Island," which was described by Lauritz Melchior as "a wonderful show. Its idea, music and lyrics will be a revelation to everyone, capturing the heart of every man and nation."

At the Caux assembly delegates from all parts of Africa, including 13 members of parliament from Nigeria, were present. A new play entitled "Freedom" was written and produced by an all-African cast in six days and presented in many of the capitals of Europe. In Bonn, Ger., Vice-Chancellor Franz Blücher welcomed the cast at an official reception on behalf of the German federal government.

Delegates from India and Pakistan spoke together of the growing force of Moral Re-Armament in their countries. Jaiendra Kumar, Hindi author of India and member of the executive of the National Academy of Letters, in presenting a special portrait of Mahatma Gandhi, said, "Gandhi belonged to the whole world. Moral Re-Armament also belongs to every nation."

The Washington assembly in January was attended by parliamentarians from nine countries. Fifteen members of the senate and house of representatives spoke in congress of its work.

Delegates from 11 Asian and African nations said in a report, "Moral Re-Armament has brought us unity born of change starting with ourselves, compelling enough to bridge every barrier. It is a new light of hope for Asia and Africa—and America too." (F. N. D. B.)

World Health Organization. The World Health organization (WHO) became a specialized agency of the United Nations on Sept. 1, 1948, when 26 countries had ratified its constitution, and by 1955 comprised 81 full member states and 4 associate members.

As a result of the demonstrated fact that certain anopheles vector species of malaria had developed resistance against residual insecticides, the eighth World Health assembly decided that "WHO should take the initiative, provide technical advice and encourage research and co-ordination of resources in the implementation of a programme having as its ultimate objective the worldwide eradication of malaria." It was envisaged that if this program were fully implemented malaria eradication might be achieved in most parts of the world in about ten years' time. Also, WHO entered upon the field of the peaceful uses of atomic energy and participated in the conference on this subject held in Geneva, Switz., during Aug. 1955.

On the eve of the new malaria eradication plan, to implement which WHO was sending many internationally known malariologists to crucial areas, malaria control projects assisted by the organization were under way during the year in Burma, Cambodia, the Caribbean area, Central America, China (Formosa), Colombia, Dominican Republic, British East Africa, French Cameroun, Haiti, Indonesia, Iran, Iraq, Liberia, Mexico, Nepal, Nigeria, Sarawak, Saudi Arabia, Syria and among Arab refugees from Palestine. A further improvement was effected in the cost of controlling treponemal diseases, such as yaws, which fell during 1955 to approximately 75 cents per patient or contact treated with penicillin and about 10 cents per patient examined, including all national and international expenditures, in new campaigns launched in the Caribbean area, Fiji and Western Samoa and Netherlands New Guinea, as well as in campaigns continued from the previous year in Haiti, Indonesia, Laos, Liberia,

Malaya, Nigeria, Philippines and Thailand. By the end of 1955 more than 40,000,000 people had been examined and 10,000,000 treated in these and allied mass campaigns (including venereal disease control and endemic syphilis campaigns) assisted by WHO.

Following the development of a vaccine against poliomyelitis, WHO convened a study group toward the end of 1955 of leading experts from nine different countries to summarize the present stage of knowledge and to advise on the essential facts on which a policy regarding the future public health application of vaccination against poliomyelitis under different epidemiological conditions might be based.

In order to ameliorate the acute shortage of nursing staff, particularly in underdeveloped areas, WHO added 38 nurses and midwives to its international training staff, which reached a total of 158. Fifty-six of these were working with national nurses in providing basic training in 22 countries; 29 nurse midwives assisted in training in seven countries.

Closely linked with these, WHO staff assisted in maternal and child health demonstration and training programs in Afghanistan, Cambodia, Hong Kong, Iran, Iraq, Jordan, Libya, Pakistan, Turkey and Vietnam, while programs for the development of general public health services with special emphasis on maternal and child health were initiated (with the help of UNICEF) in Bolivia, Ethiopia, Honduras and Uruguay and were continued from the previous year in Guatemala, Colombia, Dominican Republic, Ecuador, Nicaragua, Panamá, Paraguay, Peru and Thailand.

In environmental sanitation, WHO's training program was further developed during the year with new projects started in India, Egypt, Afghanistan and Libya, while existing training courses for sanitary engineers and inspectors continued in Mexico, Brazil, Chile and Ethiopia.

World-wide Epidemiological Intelligence and Health Statistics services, which warn public health administrations everywhere by radio and weekly mailed bulletins of outbreaks of epidemic diseases, continued to be operated from headquarters in Geneva, and statistical reports and technical journals and monographs on specific health problems continued to be published.

The eighth World Health assembly took place in May 1955 at Mexico City and approved a budget of \$10,203,084 for the year 1956. A sum of \$309,000 was set aside from the 1956 regular budget to assist world-wide malaria eradication, while the assembly also established a special fund for this purpose open to voluntary contributions from governments and private sources. More than 300 major health programs were included in the program proposed by M. G. Candau, director-general, for 1956 and approved by the assembly. The Sudan was admitted as an associate member, while the Soviet Union announced during the course of the year that it would resume active participation in the work of WHO.

The ninth World Health assembly was to take place in Geneva during May 1956. (*See also* CHILD WELFARE.) (M. S. W.)

Wrestling. A small squad of seven grapplers from Japan captured the greatest attention in the national Amateur Athletic union championships held at the Amityville Memorial high school in Amityville, L.I., N.Y., March 31, April 2-3, 1955. Ineligible for the team award, the visitors took three titles in each of the free-style and Graeco-Roman divisions. Katsutoshi Yokoyama was a double victor at 114½ lb. William Kerslake of Cleveland, O., competing unattached, won unlimited class honours in both types of wrestling for the third straight year. The New York Athletic club took the free-style team trophy and the Ft. Campbell (Ky.) team triumphed in the Graeco-Roman competition.

Free-Style Champions

114.5 lb.—Katsutoshi Yokoyama, Japan.
 125.5 lb.—Etsuma Iwano, Japan.
 136.5 lb.—Motoichi Motohoshi, Japan.
 147.5 lb.—Joseph Scandura, New York A.C.
 160.5 lb.—Melvin Northrup, San Francisco, Calif.
 174 lb.—Wenzel Hubel, Ft. Campbell, Ky.
 191 lb.—Tim Woodin, Ithaca (N.Y.) Grapplers.
 Heavyweight—William Kerslake, Cleveland, O.

Graeco-Roman Champions

114.5 lb.—Katsutoshi Yokoyama, Japan.
 125.5 lb.—Shuhei Imada, Japan.
 136.5 lb.—Todashi Numajiri, Japan.
 147.5 lb.—Newton Copple, New York A.C.
 160.5 lb.—Henrik Hansen, McBurney Y.M.C.A.
 174 lb.—Jim Peckham, Boston (Mass.) Y.M.C.A.
 191 lb.—Bob Steckle, Kitchener (Toronto) Y.M.C.A.
 Heavyweight—William Kerslake, Cleveland, O.

The third national judo tourney of the A.A.U. was conducted under the auspices of the Nanka Judo Yudansha-Kai (Southern California Judo Black Belt association) at the Olympic auditorium at Los Angeles in May. A total of 278 contests were held in two days of competition. Individual winners were:

130 lb.—Ben Takahashi, Hollywood, Calif.
 150 lb.—Kenji Yamada, Seattle, Wash.
 180 lb.—John Osako, Chicago, Ill.
 Heavyweight—Eugene La Bell, Hollywood.

College Wrestling.—Oklahoma A. and M. college of Stillwater, Okla., won the National Collegiate Athletic association team title for the second successive campaign in the annual tournament held at Cornell university, Ithaca, N.Y., March 26–27. Individual victors follow:

115 lb.—Terrence McCann, Iowa.
 123 lb.—Ed Peery, Pittsburgh (Pa.).
 130 lb.—Myron Roderick, Oklahoma Aggies.
 137 lb.—Lawrence Fornicola, Penn State.
 147 lb.—Edward Eichelberger, Lehigh.
 157 lb.—Bill Weick, Iowa State Teachers.
 167 lb.—Fred Davis, Oklahoma Aggies.
 177 lb.—Dan Hodge, Oklahoma.
 191 lb.—Peter Blair, Navy.
 Heavyweight—William Oberly, Penn State.

(T. V. H.)

Wyoming.

A Rocky mountain state of the United States, 1890, as the 44th state. The name of the state, which means "the end of the plains," was derived from the Delaware Indian language and the Wyoming valley in Pennsylvania. It derived its motto "Equality state" because of its pioneer work in woman suffrage. It is also known as the "Sagebrush state" and the "Cowboy state." Wyoming ranks 8th in size and 47th in population among the states. The land area is 97,506 sq.mi.; water area, 408 sq.mi. The 1950 census, which gave a total population of 290,529, listed rural inhabitants at 145,911, or 50.2% of the population of the state, and urban at 144,618, or 49.8%. Of the total inhabitants, 270,719 were listed as native white, 2,557 as Negro, 13,290 as foreign born and 3,963 as nonwhite. The July 1, 1955, population estimate was 295,000. The capital is Cheyenne, with a population (1950 census) of 31,935. The other cities with populations of 10,000 or more were: Casper, 23,673; Laramie, 15,581; Sheridan, 11,500; and Rock Springs, 10,857.

History.—In the federal legislature, the state of Wyoming was represented in 1955 by a Democratic senator, Joseph C. O'Mahoney; a Republican senator, Frank A. Barrett; and a Republican representative, E. Keith Thomson. Elected in 1954 to state offices for the term of 1955–1959 were Milward L. Simpson, governor; Everett T. Copenhaver, secretary of state; Mrs. Minnie A. Mitchell, auditor; Charles B. Morgan, treasurer; and Miss Velma Linford, superintendent of public instruction. The state senate was composed of 19 Republicans and 8 Democrats, and the state house consisted of 33 Republicans and 23 Democrats for the period 1955–56.

Range feed in eastern Wyoming made a rapid comeback after the 1954 drought and feed supplies were generally good in this area. Drought conditions prevailed in parts of south central and central Wyoming again in 1955 and six counties were de-

clared disaster areas by the president. Cash receipts from farm and ranch marketings in 1955 were expected to equal or exceed 1954. Crops were good in dry-land areas and in most irrigated sections.

The first really important Wyoming deposit of lithium, used in the production of hydrogen bombs, was discovered in 1954. Selenium was discovered near Baggs, Wyo., in 1955. A strategic nonmetallic element, the deposit was believed to be the first commercial selenium mining deposit in the United States. Uranium production was rapidly expanding although exact production data was still classified. The first government uranium buying station went into operation at Riverton, Wyo., in 1955. Many coal mines in the southwestern part of the state which had been closed in 1954 were reopened in 1955.

Education.—In 1954–55 there were 555 elementary and rural schools in Wyoming, with 1,537 elementary teachers and 432 rural teachers and a total enrolment of 68,201. There were 87 accredited high schools with 1,059 teachers and an enrolment of 15,708. State operating expenditures for education in 1954–55 were approximately \$20,489,497. A total of 150 school administrators were employed in the state during this period.

Social Insurance and Assistance, Public Welfare, and Related Programs.—Funds spent on public welfare for the period Oct. 1, 1954, to Sept. 30, 1955, were spent as follows: old-age assistance \$2,828,128; aid to dependent children \$721,178; aid to the blind \$52,291; general welfare \$221,824; aid to the permanently and totally disabled \$326,556; general welfare health \$443,594. Unemployment insurance payments amounted to \$2,662,724 for the fiscal year ended June 30, 1955.

Correctional institutions had 409 inmates and appropriations (for the period July 1, 1955, to June, 1957) as follows: state penitentiary at Rawlins, 296 inmates, appropriation \$515,500, capital outlay \$25,000; penitentiary farm at Riverton, appropriation \$97,914, capital outlay \$25,000; girl's school at Sheridan, 58 inmates, appropriation \$225,800, capital outlay \$5,200; boy's school at Worland, 55 inmates, appropriation \$249,337, capital outlay \$104,600.

A home and hospital for the aged at Thermopolis, the only state-owned and state-operated home of this type in the United States, was granted an appropriation of \$239,500, capital outlay \$218,500.

Communications.—During the period July 1, 1953, to June 30, 1954, the Wyoming highway department let approximately 149 contracts for a total expenditure of \$10,644,640, of which 44 contracts amounting to \$1,599,630 were for state-county co-operative projects. The highway system in Wyoming consisted of 4,829.4 mi., of which 1,530.2 mi. were secondary routes. The maintenance budget for the period Jan. 1, 1954, to Dec. 31, 1954, was set at \$3,300,000. There were 7 railroads in the state in 1954 with main track mileage (within the state) of 2,385.56 mi. There were 42 commercial and municipal airports and airfields in the state in 1955, of which 2 were used jointly by the military, and 90 private strips. There were 95,084 telephones.

Banking and Finance.—On June 30, 1955, there were 28 state banks with deposits of \$83,113,657.87 and resources of \$91,363,648.45. There were 25 national banks with deposits of \$224,548,434.92 and resources of \$241,462,123.47. On Dec. 31, 1954, there were 10 savings and loan companies with resources of \$37,527,460. Total state receipts for the period of July 1, 1954, to June 30, 1955, were \$65,815,112.14. Total disbursements for the same period were \$57,699,626.95. As of June 30, 1955, the state was obligated for \$3,695,000 worth of revenue bonds (not guaranteed). The state had no general obligation bonds.

Table I.—Principal Crops of Wyoming

	Indicated 1955	1954	Average 1944–53
Corn, bu.	1,254,000	875,000	988,000
Wheat, bu.	5,351,000	3,315,000	6,075,000
Oats, bu.	4,680,000	3,564,000	4,602,000
Barley, bu.	4,088,000	3,648,000	4,176,000
Hay, tons	1,390,000	1,103,000	1,231,000
Beans, dry, 100-lb bags	899,000	976,000	1,085,000
Sugar beets, tons	392,000	475,000	411,000
Potatoes, bu.	1,633,000	1,536,000	1,784,000

Source: U.S. Department of Agriculture.

Agriculture.—The total acreage of crops including wild hay harvested in 1953 was 2,022,000. Cash receipts from crops and livestock and livestock products amounted to \$128,824,000. Cash receipts from crops accounted for 25.7% of the total, and livestock and livestock products

Table II.—Number and Value of Livestock in Wyoming

	Jan. 1, 1954 No. on farms	Value, 1954	Jan. 1, 1953 No. on farms	Value, 1953
Cattle and calves	1,178,000	\$108,376,000	1,178,000	\$139,004,000
Hogs and pigs	37,000	1,202,000	53,000	1,150,000
Stock sheep and lambs	1,935,000	27,864,000	2,103,000	34,700,000
Horses	63,000	2,583,000	66,000	2,310,000
Mules	1,000	40,000	1,000	40,000
Chickens	670,000	871,000	658,000	822,000
Turkeys	11,000	70,000	13,000	78,000

for 74.3%. Government payments of all kinds for 1953 totalled \$3,382,000.

Manufacturing.—According to the 1952 survey of manufactures made by the bureau of the census, the total estimated value added by manufacturers was \$38,094,000. The total employment (production workers

only) at this time was 4.241, with total wages paid amounting to \$17-346,000. Total pay roll for the year 1952 for both administrative and production workers was \$23,805,000. (W. F. Bg.)

Mineral Production.- Table III shows the tonnage and value of those mineral commodities produced in Wyoming in 1952 and 1953 (preliminary) whose value exceeded \$100,000. In 1953, Wyoming was third among the states in output of vermiculite, and ranked 16th among the states in the value of its mineral output, with 1.78% of the U.S. total.

Table III.—Mineral Production of Wyoming
(Short tons, except as noted)

Mineral	1952		1953	
	Quantity	Value	Quantity	Value
Clays	707,000	\$ 9,177,000	853,000	\$10,037,000
Coal	6,088,000	26,452,000	5,245,000	23,744,000
Iron ore	543,000	*	733,000	*
Natural gas (000 cu. ft.)	75,313,000	5,874,000	76,262,000	6,025,000
Natural gasoline (gal.)	51,000,000	4,016,000	?	*
Petroleum (bbl.)	68,074,000	148,400,000	82,618,000	195,800,000
Petroleum gases (gal.)	39,000,000	1,881,000	?	*
Phosphate rock	187,000	1,247,000	?	*
Sand and gravel	2,427,000	1,739,000	3,149,000	2,001,000
Stone	1,467,000	1,689,000	1,431,000	1,840,000
Other minerals	6,353,000	...	16,459,000
Total		\$206,828,000		\$255,906,000

*Value included with other minerals.

X-Ray and Radiology.

S. Macht and P. Lawrence reported in March 1955 the results of an extensive study of the possible effects of relatively small but frequent doses of ionizing radiation on the offspring of radiologists as compared with a control group of nonradiologists. Questionnaires were sent to approximately 3,800 radiologists and 3,800 other medical specialists as controls. It was discovered that normal offspring constituted 82.83% of the unexposed group as compared with 80.59% normal offspring of the exposed group. The offspring of exposed fathers (radiologists) also showed a higher incidence of congenital defects. Congenital defects in offspring of the exposed group had an incidence of 5.99% while in the control group the incidence was 4.84%. These figures indicated that the exposed group showed a consistent trend of higher rates of abnormality in the first generation offspring. The effect on future generations might be much more severe and numerous.

Roentgen examination of the pancreas was made by H. Doubilet and his associates with injection of aqueous contrast medium through a polyvinyl tube inserted into the duct of Wirsung at surgery. This examination was also made postoperatively through a plastic tube which was brought through the abdominal incision along with a T tube which was inserted into the common duct. The authors concluded that the examination was of value in demonstrating the anatomy of the pancreatic duct system, demonstrating aetiologic factors and various pathological features in the clinical course of recurrent pancreatitis, and also demonstrating the presence of oedema or acute inflammation in any part of the pancreas and its resolution under treatment. This study furthered the understanding of the physiology and pathology of the pancreas.

Since tumours within the orbit are frequently difficult to diagnose, the studies made by P. Manchester *et al.* on orbitography were an important step in the roentgenologic diagnosis of tumours of the eye region. Orbitography is defined as the roentgenographic contrast visualization of the orbital structures. Experiments were done by the injection of a water-soluble contrast medium, Diodrast, directly into the orbits of rabbits. Good X-rays were obtained of the orbital structures following the injection of one cubic centimetre of Diodrast. Diodrast is somewhat irritating to the orbital structures if contact is prolonged. The use of hyaluronidase considerably enhanced the absorption of Diodrast and thereby reduced the irritation to the orbital structures. The safety of the procedure was demonstrated in rabbits. It was soon to be tried cautiously in humans.

Intravenous urography in pediatrics is often made difficult by the large amount of gas and faeces in the gastrointestinal tract which obscures the kidney regions. Another factor is the low specific gravity of the urine in infants and consequent poor

concentration of opaque medium in the urine, producing poor pyelographic studies. J. Hope and F. Campoy overcame these difficulties by dehydrating the patients and then using oral feedings of a carbonated beverage following the intravenous injection of the opaque medium. The stomach becomes distended with gas and the underlying kidney shadows are well outlined and visualized. In a series of 200 cases they had excellent intravenous urographic studies in 95%.

Acute radiation sickness frequently interferes with the treatment of malignant tumours by radiation. Corticotropin made it possible to treat tumours more intensively and with much higher doses. Approximately 15 radiologists reported to K. Taber concerning their experience with ACTH in relieving radiation sickness. The vast majority of the patients they treated showed excellent response. Corticotropin provided a valuable contribution to the armamentarium of drugs used whenever radiation sickness occurs. This included patients treated for malignant conditions acquired by roentgen radiation, radioactive isotopes or even in fission bomb disasters.

Radioactive colloidal gold is a useful drug in the treatment of serous effusions resulting from cancer, but technical difficulties limit the ease of use of this isotope. Personnel must be protected from the high-energy gamma radiation and from spillage of the radioactive colloidal gold solution. N. Simon and J. Melamed devised a simple and safe technique for the administration of radioactive gold at Mount Sinai hospital, New York city. By using their technique, no member of the team administering the gold had received more than three milliroentgens of total body radiation in a single treatment. The safety of the procedure was in part the result of its simplicity. The method of administration is to displace the gold from a lead-shielded bottle into the patient from an elevated bottle of saline solution. Expendable plastic tubing which is commercially available is used throughout the procedure. This simple and safe method of administration makes it possible for a larger number of patients to be treated palliatively with radioactive gold.

The interest in high-energy radiation for the treatment of cancer had grown during the past few years. M. Friedman, J. Dresner and G. Hine reviewed the major advantages of super-voltage radiation including increased relative depth dose and reduced skin absorption. Tumour-lethal doses can be delivered to deep-seated tumours which could not be adequately treated with conventional X-ray therapy (250 K.V.P.) machines. Further progress was made with the use of multiple portal crossfiring techniques and rotation therapy. Using these methods, lethal doses can be delivered to tumours while the normal tissues are spared. (See also TUBERCULOSIS.)

Yachting.

If one were to pick the outstanding yacht and yachtsman of 1955, it would have to be the 54-ft. yawl "Carina II" of Greenwich, Conn., and her owner-skipper, Richard S. Nye. Designed by Philip L. Rhodes of New York and built in Germany, "Carina II" was unloaded from a steamer in New York little more than a week before the start of the 3,450-mi. race from Newport to Sweden, rigged and

fitted out in record time and on June 11, a completely untried craft, she started with six other U.S., German and Norwegian yachts in the trans-Atlantic race. Confounding the experts who said no yacht could safely, let alone successfully, undertake such a shakedown race, she won the race to Sweden—and went on winning. In seven starts she won the trans-Atlantic race; the Fastnet race in a fleet of 46 of the fastest ocean racing yachts in British and European waters; the Britannia, New York Yacht Club Challenge, and Preston Challenge cups in shorter races in British waters, and in her other two starts took a second and a fourth prize.

In another trans-Atlantic race, of 4,200 mi. from Havana, Cuba, to San Sebastian, Sp., the winner among four starters was the 70-ft. yawl "Mare Nostrum," under the Spanish flag, owned and commanded by Enrique Urrutia. "Mare Nostrum" also sailed in the Fastnet race, leading the fleet home although beaten on corrected time.

In the trans-Pacific race, from Los Angeles to Honolulu, Hawaii, history was made when the 39-ft. ketch "Staghound," Ira J. Fulmore, won her second consecutive victory, topping the record 53-boat fleet in a windy race in which the first boat to finish, Richard S. Rheem's 96-ft. ketch "Morning Star," set a new race record of 9 days, 15 hr., 5 min., 10 sec. for the 2,225 mi.

Other major ocean and long distance race winners: the southern circuit, Governor of Florida's trophy, won by "Hoot Mon" owned by Worth Brown, Lockwood Pirie and Charles Ulmer, for the second consecutive year; "Hoot Mon" also took her second St. Petersburg-Havana race. On the east coast, Storm Trysail club-Block Island race, won by "Niña," C. DeCoursey Fales; New London-Annapolis race, won by "Actaea," Henry Sears; Stamford-Vineyard race, won by "Revonoc," Harvey Conover. On the west coast, Swiftsure race, won by "Serada," C. D. Goodhope; Tri-Island series, won by "Ono," Herbert Ward Day; Buckner Trophy race, won by "Ocean Queen V," Ray Demere; the Whitney trophy (Southern California ocean racing series), won by "Nalu II," Peter Grant. On the Great Lakes, Chicago-Mackinac race, won by "Revelry," Norman Sarns; Port Huron-Mackinac race, won by "Glory Bea II," James Parlin; Rochester race, won by "Rascal," Mort Anstice.

A dozen or more U.S. yachts took part in the 125th anniversary regatta of the Royal Swedish Yacht club on the Baltic. One of them, "Windigo," Walter Gubelmann, won the around-Gotland long distance race and another, "Arabella," Pehr Sparre, took the class 4 prize in the same event. U.S. six-metre sloops also took part in the racing at Sandhamn, Swed., but brought home no prizes as "Ylliam IX," Andre Firmenich, of Switzerland, won the One Ton cup. However, a few weeks later on the Solent the same U.S. six-metre team won both the British-American and Old World-New World team race series without losing a single race. In other six-metre events two Toronto, Can., boats took the honours: "Buzzy II," William Gooderham, the North American championships and "Bibis," Denbeigh Taylor, the George cup.

A novel feature of the season was the 50th anniversary of the famous Herreshoff-designed New York Yacht club 30-ft. class. Several of the old but sprightly sloops were out and racing and Henry H. Horrocks' "Blue Moon," from the Chesapeake bay, won the official Golden Jubilee regatta off Manhasset bay, L.I.

Outstanding yacht on the New York Yacht club cruise was "Tioga," new Nielsen-designed yawl owned by Bradley Noyes of Boston, which won several of the squadron runs and the Astor and Una cups. The Queens cup went to J. N. Matthews' 12-metre "Vim."

Individual championship series under the auspices of the North American Yacht Racing union produced new continental senior, women's and junior titleholders. The Mallory trophy (senior championship) was won by the Seattle, Wash., crew headed by William Buchan, Jr.; the Mrs. Adams trophy (women's) by a Manhasset bay crew steered by Miss Toni Monetti, and the Sears Bowl (juniors) by a Royal Canadian Yacht club (Toronto) crew headed by "Skippy" Leonard. Massachusetts Institute of Technology crews won the Morss trophy for the intercollegiate national sailing title.

Winning skippers of the 1955 national and international championships in some of the leading one-design racing classes were as follows: Star class (North American), Jorge de Cardenas, of Cuba; Lightning class, Thomas Allen, Bainbridge, Md. (second straight); Snipe class, Mario Capiro, of Italy; Comet class, Howard Lippincott, Riverton, N.J. (second straight); 110 class, Cornelius Shields, Jr., Larchmont, N.Y.; Penguin class, Billy Seeman, New Orleans, La.; Moth class (Nationals), Sonny Cabell, Norfolk, Va. (second straight); 210 class, John J. McNamara, Jr., Cohasset, Mass.; Thistle class, Gordon Douglass, Paineville, O.; Raven class, J. P. Roosevelt, Oyster Bay, N.Y.; Y Flyers (International), Harry Jones, Pointe Claire, Que.; L-16 class, Henry Enos, Greenwich, Conn.; Highlander class, Benn Sawyer, Cowan Lake, N.Y.; National One-Design class, John Christianson, Milwaukee, Wis.

(W. H. Tr.)

Yalta Documents. The records of the Yalta conference were released to the public on March 16 by the U.S. department of state. These diplomatic documents, officially entitled "The Conferences at Malta and Yalta 1945," disclosed in an estimated 500,000 words details of the conference held by Pres. Franklin D. Roosevelt, Prime Minister Winston Churchill and Marshal Joseph Stalin near the Crimean resort of Yalta in the U.S.S.R., Feb. 4-11, 1945, and of the previous Anglo-American discussions at Malta, Jan. 30-Feb. 2, 1945, attended by President Roosevelt and Prime Minister Churchill. The latter were designed to co-ordinate United States and British views on various subjects expected to arise later at Yalta.

The agreements reached at Yalta, when the end of the European war was in sight, provided for such postwar political arrangements as the occupation of Germany, the payment of reparations by that country, the convocation of a conference to draw up a charter for a world organization, the reorganization of the provisional government of Poland and concessions of territories and privileges in the far east to the Soviet Union in exchange for that nation's entry into the war against Japan. Because portions of these agreements were kept secret, particularly the agreements on the far east, and because they concerned certain areas over which Communist domination expanded after the war, they aroused considerable controversy. Although the text of the agreements was made public by the U.S. state department in March 1947, critics of the agreements demanded release of the complete Yalta proceedings.

The Republican-controlled 83rd congress in 1953 and again in 1954 appropriated funds for the state department to publish a series of volumes on World War II conferences of heads of governments as part of its official diplomatic collection, *Foreign Relations*. The department had scheduled the Yalta conference first in this special series. By the fall of 1954 the Yalta papers were ready for the printer, but the British government, to which a set of proofs had been sent, did not give its approval.

On March 14 the state department announced that it was not going to publish the Yalta documents but was going to send transcripts to congressional leaders for their official use. However, chairmen of important congressional committees, now con-

"UNCORKED AT LAST," a 1955 cartoon by Costello of the *Knickerbocker News* (Albany, N.Y.)

trolled by Democrats, declined to accept the documents on that basis. Some took the position that the state department should either keep the transcripts or publish them in full. On the following day the *New York Times* obtained from the department an advance copy of the text on condition that it publish the documents in full. This was learned by the *Chicago Tribune* which, according to its version, enlisted the aid of certain members of congress to persuade the department of state to make the text generally public. Meanwhile the department had received the British government's agreement to publication and it made a general release of the Yalta papers in the form of two volumes of galley proof on the evening of March 16.

The editors asserted that they aimed at presenting as definitive and comprehensive a coverage of the Yalta and Malta conferences "as could be made at the present time." They believed that the documents, which included materials from the files of the department of state, the Roosevelt library at Hyde Park, N.Y., and the department of defense, gave an accurate portrayal of the basic policy of the United States at the conference. No new major decisions of the conferees were revealed by the Yalta records, but many new details were, such as the efforts—later proved unsuccessful—of the western powers to erect a free and independent government in Poland, and critical remarks of the negotiators regarding certain national groups.

Besides background correspondence, memoranda and briefing papers the Yalta documents also included minutes of many of the meetings. There was no tripartite stenographic account of the sessions, and each delegation kept its own records. Minutes and notes of the meetings were kept by various members of the United States delegation, the most complete of which were those of Charles Bohlen, who acted as interpreter. For some of the conference discussions no records existed, and it was believed

that there might be significant papers still in private collections access to which was not available to the editors. There was little in the published documents, for instance, on the discussions regarding the concessions to the Soviet Union in the far east.

The release of the Yalta documents had a mixed reception. Critics charged that publication was prompted by partisan political motives; that it was a violation of confidence and embarrassing to Sir Winston Churchill, the sole survivor of the three leading Yalta negotiators; that a bad effect would be created abroad, particularly on relations with Germany and France; that it would cause other countries to be more cautious in "secret" diplomatic negotiations with the United States; and that it might handicap efforts to arrange a high-level conference with the Soviet Union.

Defenders of the release maintained that it was in the interest of an informed public and of historical accuracy; that it had long been the practice of the United States government to release diplomatic documents after a suitable period, and that the recent tendency was to publish papers on specific incidents; that knowledge of the details of Yalta carried a lesson for the future and might prevent other secret agreements settling the fate of peoples and territories; and that it was better to publish the documents as a whole than have them leak out piecemeal.

(C. R. G.)

Yellow Fever: see TROPICAL DISEASES.

Yemen. An Arab kingdom in the southwestern coastal region of the Arabian peninsula. Yemen lies between Saudi Arabia (northwest and northeast), Aden (southeast) and the Red sea (southwest). Area: about 75,290 sq.mi. Pop. (1953 est.): 4,500,000. Language: Arabic. Religion: Moslem. Chief towns (pop., est.): Sana (cap.) 50,000–60,000; Taiz (seat of imam) 12,000; Hodeida (port) 30,000. Imam (king): Ahmed ibn Yehya Hamid ed-Din; prime minister in 1955, Crown Prince Seif ul-Islam el-Badr.

History.—The failure in April 1955 of a *coup d'état* led by two of the imam's brothers led to the formation of a new government under the premiership of the crown prince, who had been primarily responsible for the failure of the revolt. No other members of the royal family were included in the cabinet.

In January a meeting between the British agent of the western Aden protectorate and a Yemeni delegate produced an agreement to control tribal unrest along the frontier, and later in the month the British minister of state for colonial affairs (Henry Hopkinson) stated during his visit to Aden that the policy of the British and Aden governments was the maintenance of the friendliest relations with Yemen and that they would welcome any Yemeni proposals which did not run counter to British commitments to Arab rulers within the western protectorate, where plans for federation were under active consideration. But in May and June frontier incidents recurred and British troops were flown to Aden to preserve order.

In March Yemen supported the Egyptian proposals for a new Arab defense treaty and associated itself with the Egyptian and Saudi Arabian protests against the Turco-Iraqi treaty.

(O. M. T.)

See W. Phillips, *Qataban and Sheba* (New York, London, 1955).

Agriculture.—Main crops: wheat, barley, millet; coffee (metric tons, 1953) 4,800, (1952) 4,000.

Finance.—Monetary unit: Maria Theresa dollar, called the *riyal*, nominally equal to 1 Indian rupee with an exchange rate of R. 4.76 to the U.S. dollar.

Foreign Trade.—Trade with the U.K. (1953; 1954 in parentheses): imports £8,000 (£4,000); exports £22,000 (£4,000).

Yiddish Literature: see JEWISH LITERATURE.

Young Men's Christian Association: see SOCIETIES AND ASSOCIATIONS, U.S.

Young Women's Christian Association: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Yugoslavia. A federal people's republic of southeastern Europe. Yugoslavia is bounded north by Austria, north and northeast by Hungary and Rumania, east by Bulgaria, south by Greece and west by Albania, the Adriatic sea and Italy. Area: 98,700 sq.mi. Pop.: (1953 census) 16,989,164; (1955 est.) 17,557,000.

Republic	Population (1953 census)	Capital (pop. 1953 census)
Serbia*	6,983,544	Belgrade (469,988)
Croatia	3,936,642	Zagreb (350,452)
Slovenia	1,501,961	Ljubljana (138,211)
Bosnia-Herzegovina	2,843,486	Sarajevo (135,657)
Macedonia	1,303,906	Skopje (121,551)
Montenegro	419,625	Titograd (16,333)

*Including the autonomous province of Vojvodina (pop., 1,713,905) and the autonomous region of Kosovo-Metohija (pop., 809,234).

Other towns (pop. 1953 census): Subotica 115,402; Novi Sad 83,223; Maribor 77,124; Split 75,377; Rijeka 75,112; Nis 60,677; Osijek 57,320. Nationalities (1953 census): Serb 42%, Croat 23.2%, Slovene 8.9%, Macedonian 3.7%, Montenegrin 3%, undefined (Bosnian, Istrian, etc.) 5.8%, others (national minorities) 13.4%. Religion (1948 est.): Greek Orthodox 49.53%, Roman Catholic 36.7%, other Christian 1.14%, Moslem 12.52%, other 0.11%; at the 1953 census 13.6% replied "no religion." President of the republic, chairman of the federal executive council (government) and supreme commander of the armed forces in 1955, Marshal Tito (Josip Broz) (*q.v.*).

History.—Home Politics.—The trial of Milovan Djilas and Vladimir Dedijer for hostile propaganda against the state took place on Jan. 24, 1955. The proceedings were not public. The two defendants were condemned to 1½ years' and six months' imprisonment respectively, but both sentences were suspended subject to their future good behaviour.

In June 1955 the federal parliament passed a law on the reform of local government. The number of districts (the third level of administration, below republic and region) was reduced from more than 300 to just over 100, the number of communes (the lowest level of administration) from more than 4,000 to about 1,500. The average population of a commune was to be 10,000 persons. The purpose of the reform was to create basic units of local government of such a size as to be able economically to stand on their own feet, though of course they could not be economically self-supporting. The authorities regarded this creation of more rational administrative units as an important step toward the achievement of the type of decentralized socialist democracy which was their declared aim.

The sentences of more than 1,000 Yugoslav political prisoners were wiped out or cut on Dec. 3 under a general amnesty.

Economic Position.—During 1954 total industrial output in Yugoslavia went up by 13%, and at the end of the year was stated to be 209% of the level of 1939. The change in the social structure of the population was shown by the fact that nonagricultural occupations, to which in 1938 belonged less than 24% of the people of Yugoslavia, at the end of 1954 accounted for more than 38%. The most important single industrial achievement of the year was the completion of the Jablanica power station in the Neretva valley in Herzegovina. In March 1955 two of its six turbines began to operate. Its total output was expected to be 800,000 kw.hr. yearly.

In agriculture results were less satisfactory. The area under cultivation for cereals was still substantially smaller than before World War II, and only a part of the difference was made up by greater cultivation of industrial crops. As an incentive to peasant producers, on July 10 substantial increases in prices of wheat bread and fats were announced. Tobacco prices and railway passenger fares were also raised.

Foreign Affairs.—The year 1955 was eventful for Yugoslav foreign policy. On May 26 the Soviet prime minister, Marshal N. A. Bulganin, and the first secretary of the Communist Party of the Soviet Union, N. S. Khrushchev, arrived in Belgrade. In a speech at the airport, Khrushchev attributed the past conflict between Yugoslavia and the Soviet Union to the influence of the executed L. P. Beria and V. S. Abakumov, who had "deliberately provoked bitterness" in their relations. He expressed the belief that mutual confidence and understanding would be restored between the Communist parties of Yugoslavia and the Soviet Union. These remarks were coolly received, and it was made clear that in the Yugoslav view the visit was a matter of relations between the two states, not between the Communist parties. At the end of the visit a statement was issued. It stressed the devotion of both governments to the principles of coexistence and noninterference in the internal affairs of other countries. With regard to Soviet-Yugoslav relations, the most specific point in the statement was the announcement that a separate convention would be concluded on cultural co-operation and on the organization of information services of each government in the other's territory.

That Tito did not regard the references to separate development toward socialism as mere empty words was shown in a speech he made on July 27. Talking of the prospect of better relations with the Danubian people's democracies, he regretted that there were in those countries still persons "to whom this normalization does not appeal" and who explained the visit of Bulganin and Khrushchev as a mere manoeuvre, claiming "that the Soviet Union is practising one of its cunning tactics which are only meant to fool people." Tito referred explicitly to Hungary and Czechoslovakia, to the Rajk trial and subsequent hate campaign against Yugoslavia. Though he did not mention him by name, it was clear that his words applied mainly to Matyas Rakosi, the Hungarian Communist leader.

On Nov. 6, 1955, John Foster Dulles paid a visit to Tito at Brioni, during an interval in the Geneva conference. During their talks they discussed middle eastern, Balkan and Danubian problems. Referring to the eastern European people's democracies, the official statement declared that the two statesmen had been agreed as to the importance of the independence of these states and of "non-interference from outside in their internal affairs and their right to develop their social and economic order in the way of their own choice." Official Belgrade

NIKITA KHRUSHCHEV, Communist party secretary, reading a speech at Belgrade airport as a Soviet delegation visited Yugoslavia in 1955. Marshal Tito stands at left

comment on this phrase made clear that it expressed equal disapproval of forcible intervention from the west in these countries and of unsocialist domination over them by the Soviet Union. The Soviet news agency Tass of Nov. 14 chose to interpret this Yugoslav comment as meaning that Dulles had accepted the principles earlier expressed in the Bulganin-Tito statement of June 2 on equal rights for "different forms of socialist development."

Yugoslavia continued to show interest in its relations with its Balkan allies Greece and Turkey, which were affected however by the sharpening conflict between Greece and Turkey and between Greece and Great Britain in regard to Cyprus. In Sept. 1955 King Paul of Greece paid a state visit to Yugoslavia. Interest in Asian affairs was also maintained throughout 1955 in Yugoslavia. In February Tito arrived home from a two months' visit to India and Burma, during which he received two elephants and two leopards, publicly approved India's claims against Portugal in Gôa, and had a long conversation with Lieut. Col. Gamal Abdel Nasser on board his frigate in the Suez canal. On Dec. 1 Tito left Belgrade for an official visit to Ethiopia and Egypt. (See TURKEY.) (H. S.-W.)

Education.—Schools (1953-54): primary 14,044, pupils 1,402,000, teachers 36,040; middle and secondary 2,106, pupils 523,000, teachers 21,749; vocational (junior and intermediate) 1,074, pupils 140,000, teachers 12,002; fine arts 159, pupils 17,000, teachers 1,954. Adult education centres 229, students 13,000, teachers 1,798. Teachers' training schools and colleges 92, students 25,551, teachers 1,951. Institutions of higher education (including fine arts and physical training) 100 with 59,571 students, out of which 84 university colleges with 57,937 students, 5,195 professors and lecturers. Schools for national minorities (including some of the above with special classes): primary 1,562; middle and secondary 312; teachers' training schools 8.

Finance and Banking.—Monetary unit: dinar, with an official exchange rate of 300 dinars to the U.S. dollar. Budget: approximate revenue and expenditure (1955 est.) 232,000,000,000 dinars; (1954 est.) 262,000,000,000 dinars. Currency circulation (Dec. 1953) 68,050,000,000 dinars; (June 1954) 67,300,000,000 dinars. Bank deposits (Dec. 1953) 75,730,000,000 dinars; (March 1954) 58,190,000,000 dinars. Foreign exchange holdings (March 1954) U.S. \$5,190,000; (March 1955) U.S. \$7,500,000.

Foreign Trade.—(1954) Imports 101,820,000,000 dinars; exports 72,110,000,000 dinars. Main sources of imports: U.S. and Canada 31%; Germany 17%; Italy 7%; other continental European Payments union countries 27%; U.K. and sterling area 11%. Main destinations of exports: Germany 20%; Italy 12%; other continental E.P.U. 33%; U.S. and Canada 10%; U.K. and sterling area 11%. Main exports (1953): lumber 23%; lead 8%; copper 5%; corn 2%.

Transport and Communications.—Roads (1952): 83,170 km., including 38,984 km. metalled. Motor vehicles in use (1953): cars 10,000, commercial vehicles 21,200. Railways (1953) 11,800 km.; passenger-km. (1954) 6,488,000,000; goods, ton-km. (1954) 9,571,000,000. Shipping (July 1954): merchant vessels of 100 gross tons and over 151; total tonnage 269,000. Air transport (1954): passenger-km. 33,034,000; freight, ton-km. 951,600; km. flown 2,729,000. Telephones (Jan. 1954): 149,000. Radio receiving sets (1954): 496,811.

Agriculture.—Main crops (metric tons, 1954): wheat 1,385,000; barley 253,000; oats 233,000; rye 191,000; maize (corn) 3,004,000; rice 26,000; potatoes 1,876,000; sugar beets, raw 168,000; tobacco (1953) 29,600; dry beans 149,000. Livestock (Sept. 1954): cattle 5,097,000; sheep 12,116,000; pigs 4,310,000; horses 1,193,000; mules (Sept. 1953) 31,000; asses 164,000; goats 621,000; chickens 14,347,000; ducks, geese, turkeys 2,615,000. Wool production (metric tons, 1954) 9,000. Wine production (1954) 285,000 metric tons.

Industry.—Index of production (March 1955; 1948=100) 159, (March 1954) 135. Fuel and power (metric tons, 1954): coal 988,300; lignite 12,658,000; natural gas 90,130,000 cu.m.; crude oil 216,400; electricity 3,452,000,000 kw.hr.; manufactured gas 23,980,000 cu.m. Raw materials (metric tons, 1954): iron ore (45% metal content) 1,110,800; pig iron 367,500; crude steel 616,200; bauxite 687,000; copper ore 1,299,000; lead-zinc ore 1,485,000; pyrites (concentrates) 160,000; antimony ore 75,000; chrome ore 124,000; magnesite (1953) 122,500. Foundry production (metric tons, 1954): copper 57,000; lead 66,740; zinc 13,640. Sawn timber (cu.m., 1953): softwood 1,749,000; hardwood 447,000. Manufactured goods (metric tons, 1954): cement 1,394,000; cotton yarn 34,100; wool yarn 8,720; woven cotton fabrics 165,600,000 sq.m.

Yukon Territory. The Yukon Territory, most northerly political division of Canada, was constituted by act of parliament in June 1898. Area: 207,076 sq.mi., including 1,730 sq.mi. water. Population: (1951 census) 9,096 (including whites, 7,533; Indians and Eskimos, 1,563); (June 1, 1954, est.) 10,000. Principal centres: Whitehorse (capital), 2,594; Dawson, 783; Mayo, 241.

History.—The capital was removed from Dawson to White-

horse in April 1953. What latterly told against the former capital was its remoteness from new developments in the territory from which Whitehorse, 460 mi. upriver, is admirably situated to derive benefits. The exploitation of mineral wealth in the territory would probably be in districts more accessible to Whitehorse, which is linked with the Alaska highway. This region remained a centre of interest during 1955 since plans had been made in 1954 to establish a vast metallurgical and electrochemical industry in northern British Columbia, which included a plan to divert the water of the Yukon river through a storage chain of lakes, making it flow southward into the Taku river in British Columbia. In Aug. 1954 the British Columbia government announced that a conditional water-usage licence had been issued to Quebec Metallurgical Industries and that the first phase would be construction of an 880,000-h.p. hydroelectric smelting project and industrial site near the head of navigation on the Taku river.

Education.—The territory had (1954) 15 schools with 51 teachers and 1,234 pupils. The amount spent on education in 1954-55 was \$323,378.48.

Public Health and Welfare.—The bureau of statistics does not keep a separate record of these figures, those of Yukon Territory being included with the Northwest Territories.

Communications.—There were in 1955 58 mi. of railway. The Yukon river, 1,979 mi. long, of which 1,777 mi. are navigable (570 mi. within the Yukon Territory), permits tourist travel by boat from the end-of-steel at Whitehorse to Dawson. All-weather gravel roads connect the capital with Dawson and Mayo. There were (1954) 1,675 mi. of motor roads and secondary roads, including the Alaska highway, which enters Yukon Territory at Mile 1,221. There were 16 post offices in 1955; revenue totalled \$110,706.96 for the year ending March 31, 1955. Commercial air lines provide passenger and express services daily, except Sunday, between Vancouver and Whitehorse and Edmonton and Whitehorse. A service is also maintained twice weekly from Whitehorse to Dawson and Mayo.

Finance.—The territorial revenue and expenditure for three years ending March 31 were: (1953) revenue \$1,540,979, expenditure \$1,284,243; (1954) revenue \$2,015,635, expenditure \$1,709,904; (1955) revenue \$2,073,062, expenditure \$1,783,660.

Agriculture.—Local gardening only; there is no organized agricultural industry.

Production and Industry.—The principal industry is mining. The output of gold in 1954 was 87,811 fine oz. (\$2,991,721), silver 6,758,870 fine oz. (\$5,627,435) and lead 32,558,169 lb. (\$4,340,004). Total value of mineral production (1954) was \$16,308,108, including cadmium and zinc. The fur returns totalled for the year ending June 30, 1954, 176,338 pelts, valued at \$182,238. Beaver, muskrat, squirrel and marten constituted the major portion of the catch.

Zanzibar: see BRITISH EAST AFRICA.

Zhukov, Georgi Konstantinovich (1895-), Soviet army officer, was born at Strelkovka, Kaluga province, Russia. Drafted into the Russian imperial army in 1915, he joined the Red army in 1917 and the Communist party in 1918. In 1932 he entered the Frunze Military academy for staff officers, and, specializing in armoured warfare, was sent to Spain in 1936 as a military observer. In 1939 he was victorious in a local war against the Japanese on the Mongolian-Manchurian border. In Feb. 1941 he was appointed chief of the general staff and deputy commissar of defense, and in October of that year he commanded the army group which defended Moscow. A year later he directed the defense of Stalingrad and subsequently co-ordinated the operation of the Volkhov and Leningrad armies which resulted in lifting the siege of the city. Two days later he was created marshal of the Soviet Union. He then co-ordinated the great offensives of 1943-44 of the 1st and 2nd Byelorussian and 1st and 2nd Ukrainian army groups. On May 8, 1945, he was one of the four Allied commanders who accepted the German surrender. Zhukov was then appointed Soviet governor and commander in chief in eastern Germany. In March 1946, however, he was recalled to Moscow as commander of Soviet land forces. But J. V. Stalin was jealous of the popularity of a military

"COMRADE ZHUKOV GETS A BID," a 1955 cartoon by Green of the *Providence Journal* (R.I.)

leader who was three times proclaimed Hero of the Soviet Union, three times awarded the Order of Lenin and twice the Order of Victory, and Zhukov was demoted and sent to Odessa as commander of a military region. He emerged again in March 1953, when, after Stalin's death, he was appointed first deputy minister of defense. He became minister of defense when on Feb. 9, 1955, Marshal N. A. Bulganin formed a government. He attended the Warsaw conference where, on May 14, a 20-year treaty of mutual defense was concluded between the U.S.S.R. and seven captive countries. He also was present at the Geneva conference of the heads of the Big Four Powers in Geneva, Switz. (July 18-23).

Zinc. World production of zinc in 1954 rose 3.5% higher than the 1953 output. Table I shows production by principal producing countries, based on U.S. bureau of mines reports.

United States.—In 1954, mine production of recoverable zinc in the U.S. was the lowest since 1934 and smelter production was the lowest since 1948, according to the U.S. bureau of mines. Table II gives data on the zinc industry for 1948-54, based on the bureau's reports. A continued oversupply of zinc, decreased imports and reduced consumption were spotlights of

the domestic industry in 1954. Smelter production was affected by strikes and by operational setbacks. The more than century-old Franklin mine at Franklin Furnace, N.J., was closed as the reserves were exhausted.

In the first nine months of 1955, mine production of zinc totalled 381,800 short tons, compared with 352,400 tons in the same period of 1954. (F. E. H.; B. B. M.)

Zonta International: see SOCIETIES AND ASSOCIATIONS, U.S.

Zoology. Morphology.—The generally accepted view that sponges were unique among multicellular animals in lacking nerve cells was controverted by the studies of Pavans de Caccathy, whose development of special techniques enabled him to surmount the technical difficulties occasioned by the presence of calcareous or siliceous spicules in sponges. He discovered typical nerve cells so interrelated as to justify their being described as a nervous system.

Embryology.—Perhaps the outstanding book in embryology was the comprehensive *Analysis of Development* (Philadelphia, 1955), edited by B. H. Willier, P. A. Weiss and V. Hamburger, in which they and 28 additional specialists co-operated to give an exceptionally well integrated account of the current state of knowledge in the field of experimental embryology in animals. The book would be of the greatest interest to advanced students.

Alfred Kühn's *Vorlesungen über Entwicklungsphysiologie* (Berlin, 1955) was notable not only for the clarity with which it treated and illustrated experimental embryology, but also for the breadth of its approach, inasmuch as it dealt with problems of differentiation in protozoa and plants as well as in animals.

Of the hundreds of papers dealing with specific topics, one may be mentioned. T. W. Torrey's study of the development of the excretory system of human embryos left little doubt that the time-honoured account of the serial development in space and time of pro-, meso- and metanephros held neither for man nor for other mammals. The persistence of the former view in the face of mounting evidence against it perhaps was to be attributed to the dominance of recapitulatory theory in the interpretations of the observations. The existence of a pronephros, for example, in lower vertebrates had led to an expectation that higher vertebrates would possess a pronephros during embryonic life or at least a pronephros in rudimentary form. Torrey interpreted structures that had formerly been identified as pronephric rudiments as parts of a continuous embryonic excretory organ.

Ecology and Behaviour.—Demorest Davenport discussed in a review the problems posed by symbiosis. What stimuli served to bring symbiotic partners together? How did they find one another? What adaptations did symbionts have that their free-living relatives lacked? He pointed out the need for analytical studies. To choose a simple example from his own work, he put marine worms that normally live in the arms of a certain species of starfish in a Y-tube and into each arm of the Y fed sea water from separate aquariums, one of which contained the host animals. The worms invariably moved into the arm of the Y-tube connected to the tank containing the hosts. In numerous experiments of this kind he usually could show strongly positive and highly specific responses to chemical stimuli from the host, responses that would normally lead to parasites or commensals finding their hosts. Davenport pointed out the possibility for further analysis of the many well-known symbiotic relationships. For example, the relation between sea anemones and hermit crabs, in which the crabs, when they moved to a new shell, seized the anemones still attached to the old shell and transplanted them to the new. Despite this rough handling the anemones did not discharge their stinging cells, an adaptation to their

ALICE AND TRUDY, members of an elephant octet learning to waltz and perform acrobatics at a training farm in California. The octet gave its first performance in April 1955 at the St. Louis (Mo.) zoo

symbiotic relation to the crabs. Davenport thought that much of the behaviour of symbionts could be described in the language of recent work in animal behaviour; that is, in terms like "sign stimuli" that act as "social releasers." In these terms, he discussed the well-known relation between certain species of orchids and certain wasps. The orchids resembled female wasps, and this resemblance was the sign stimulus that released copulatory behaviour in the male. By visiting one flower after another, the male wasps transferred pollen and thus brought about cross-fertilization. The many other examples of symbiosis cited by Davenport would be of general interest.

Taxonomy, Biogeography and Natural History.—Numerous well-known specialists contributed essays to a volume celebrating the centennial of the California Academy of Sciences, *A Century of Progress in the Natural Sciences, 1853-1953* (San Francisco, 1955). In addition to accounts of the advances in the taxonomy and physiology of the principal orders of insects, there were notable chapters on herpetology (amphibians and reptiles) and animal geography by Karl P. Schmidt, ornithology by Charles G. Sibley, mammalogy by W. J. Hamilton, conservation of wildlife by A. Starker Leopold, and invertebrate paleontology and historical geology by Charles E. Weaver. The book would be of lasting interest to students of biological thought and the history of science.

Francesca R. LaMonte's revision of the classification of the game fish that includes the various marlins, spearfish, sailfish and swordfish would be of interest to sportsmen as well as to zoologists. Her study also furnished several good examples of the confusion that resulted from the use of popular names for

fish—fish of the same species may have been known under different names and fish of different species under the same name in different regions.

General.—Zoologists welcomed the first postwar edition of an important general work in their field, Alfred Kühn's introductory book *Grundriss der allgemeinen Zoologie* (Stuttgart, 1955).

An unusually clear discussion of the place of biology among the sciences and its role as an empirical science was given by Felix Mainx in his *Foundations of Biology*, vol. i, no. 9, *International Encyclopaedia of Unified Science* (Chicago, 1955). Anyone interested in either natural science or philosophy would find much of value in Mainx's discussion of the distinction between the "world picture" (*Weltbild*) developed by biology and the other empirical sciences—a picture that rests on observation, is practical and leads to predictable results—and the "philosophy of life" (*Weltanschauung*), a picture that rests on an inner faith. Mainx contended that there was no bridge from one to the other, that a system of values and faith is independent of the findings of an empirical science.

As editors of *Great Experiments in Biology* (New York, 1955) M. L. Gabriel and S. Fogel brought together some of the most important original publications dealing with the cell theory, general physiology, hormones, vitamins, metabolism, microbiology, plant physiology, embryology, genetics and evolution. The selection, ranging from the 17th century to the present, successfully conveyed the spirit and progress of biological science.

The life and times of Charles Darwin continued to attract interest. Ruth E. Moore, in her *Charles Darwin, a Great Life in Brief* (New York, 1955), skilfully treated both the notable work and the complex personality of Darwin. No previous biographer had made so convincing and well rounded a presentation of Darwin as a human being. William Irvine, in an elaborately documented book, *Apes, Angels and Victorians* (New York, 1955), presented Darwin in a less sympathetic light, although he created a vivid picture of Darwin's relation to T. H. Huxley and to the thought of the 19th century.

Among the many books directed to the general public as well as to scientists, only four will be mentioned. Rachel Carson in her *Edge of the Sea* (New York, 1955) again showed her mastery of a broad and complex subject matter—the life along the shores and in tide pools—and of a remarkable prose style that achieved scientific clarity and accuracy without sacrifice of beauty.

N. B. Marshall's highly readable *Aspects of Deep Sea Biology* (New York, 1954) was a fascinating account of the means of exploration for animals and plants of the abysses of the oceans. Many readers would find his attempt to piece together the food chains in the depths, and his description of the specialized sense and light-producing organs of many abyssal animals, of equal interest.

Karl von Frisch's *The Dancing Bees*, an account of the life and senses of the honey bee, translated by Dora Ilse (New York, 1955), although including material contained in his earlier books on vision, chemical senses and "language," went further in relating the former knowledge to the entire life history and behaviour of these most highly developed social insects.

John T. Bonner's *Cells and Societies* (Princeton, N.J., 1955) was an introduction to biology that would interest the specialist by novelty of approach and freshness of view. In addition, it would appeal to the general reader, even one without scientific background, as a book that conveyed with charm many of the leading contemporary ideas of biology with remarkably little reliance on a specialized vocabulary. (See also ENDOCRINOLOGY; GENETICS; MARINE BIOLOGY; PALAEOLOGY; PHYSIOLOGY.)

(G. P. DUS.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example "Toy Industry 56, 55, 54" indicates that the article "Toy Industry" is to be found in the 1956 *Book of the Year*, the 1955 *Book of the Year* and the 1954 *Book of the Year*. The reference "Indochina: see Cambodia; Laos; Vietnam 56. See Indochina 55, 54, 53, 52" indicates that information on "Indochina" is to be found in the articles "Cambodia," "Laos" and "Vietnam" in the 1956 *Book of the Year* and under the heading "Indochina" in the 1955 *Book of the Year*, the 1954 *Book of the Year*, the 1953 *Book of the Year* and the 1952 *Book of the Year*. All black type entries without dates indicate that the same entries appear in all the past five issues. Examples, not Advertising, 56, 55, 54, 53, 52, but Advertising; not Abyssinia: see Ethiopia 56, 55, 54, 53, 52, but Abyssinia: see Ethiopia.

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text not given a special article. Those which show page references refer to this issue only. Those which refer to the article **Obituaries** are followed by the date of issue in which the obituary appears.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
